IN Mr. Millet's excellent article in the November number of this magazine (undoubtedly correct in the main both in statement of fact and the deductions drawn therefrom) occurs the following, which I think admits of some qualification: "Few of those whose names have been prominent among the promising young artists abroad have kept up the high standard of excellence, much less have continued to make progress, after a short season at home." The work of Augustus St. Gaudens, Olin Warner, Carroll Beckwith, Kenyon Cox, Walter Shirlaw, George de Forest Brush, Alden Weir, Wyatt Eaton, William Chase, Abbot Thayer, T. W. Dewing, and Will H. Low and others seems to invalidate this assertion, for I am sure Mr. Millet will admit that they are better artists to-day than when they returned to America from their studies abroad, ten or more years ago. While it is true that the progress of these men may not have been so rapid as their more fortunate confrères whose means have permitted them to remain in the Parisian forcing-frame of art, is it not possible that there may have been upon the whole (as they have not been dominated by the Salon or the dealer) a greater tendency toward the development of the individual? Whether fortunately or unfortunately, the American artist of to-day, with rare exceptions, must turn his hand to many things. Happy the man who finds time to discover in which line of art his individuality lies. I think that Will H. Low, a reproduction of whose painting "*Dolce far Niente*" is published in this number, is a good example of this. He has done an extraordinary variety of work, little of which has been the unhampered expression of his individuality. His individuality would probably be in the line of decoration, wall-paintings, or large works to form part of the architectural design of important buildings. Certainly he has done nothing nobler or better than "*The Welcome*," and nothing which has more promise of a successful result than "*The Parting*," the picture he is now engaged on—both colossal works for the Plaza Hotel. But Mr. Low has had few opportunities for doing this class of work. He has, however, made some large easel pictures. Perhaps the best-remembered of these is "*The Skipper Ireson*," painted in 1881, certainly as good a picture as, if not a better than, "*Le Jour des Morts*," painted in France four years earlier and exhibited in the Salon. But although there are other well-known works of Mr. Low in this genre, the present condition and patronage of American art have not per-

mitted him to confine his attention to easel pictures, for such works need time and money. He has made designs for stained glass, many illustrations for magazines and books, and done much teaching. In all this variety of work he has found recognition both from artists and the public. Several of his pictures are in public collections; his illustrations to Keats's "*Lamia*"¹ and the sonnets of Keats are recognized as among the best work of their class; the window designed by him for Rock Creek Church, Washington, D. C., is an excellent example of an art in which the United States leads the world. In 1884 he was given charge of the antique class of the Cooper Institute; in 1888 was made an associate of the National Academy of Design. Soon after he was appointed director of the antique and life classes in the Academy schools, and in 1890, when thirty-seven years old (he having been born in Albany in 1853), he was elected an Academician.

Notes on "General Miles's Indian Campaigns."

I. THE RETURN HOME OF THE NEZ PERCÉS.

IN Major Baird's condensed and valuable historical article in your July number, on "General Miles's Indian Campaigns," he makes the following statement in reference to the restoration of the exiled Nez Percés: "Nearly seven years later, when General Miles had received promotion, and was commanding the department of Columbia, he at last succeeded in having Joseph and the remnant of his band returned to the vicinity of their old home." I am sure that a bit of history escaped the eye of Major Baird, and I feel confident that this unqualified statement escaped the eye of General Miles when he looked over the proofs of the article in question. General Miles is a gallant soldier, and has won the highest admiration of thousands of his countrymen, not only for his brilliant victories on the frontier, but for his Christian humanity in dealing with a conquered foe. From the beginning to the end he was the steadfast friend of the Nez Percés, but his early and vigorous efforts in their behalf, like those of Senator Dawes and Secretary Teller, were unavailing, and the Nez Percés would have *perished in their exile* but for the efforts of friends *unknown* to General Miles, who took up the lost cause, and at large expense for printing, traveling, and public meetings, and through four years of watchfulness and labor, secured the necessary congressional legislation for their removal. The documentary evidence of this is in my possession, and is sufficient to fill THE CENTURY from cover to cover.

The record of this labor includes ten thousand miles of travel, a publication of the condition of the Indians which reached not less than one million readers, mass meetings in our principal cities from New York to St. Paul, a presentation of the matter to the President, the Secretary of the Interior, and the Senate and House Committees on Indian Affairs, the work of missionaries among the Nez Percés, the strong memorials to Congress by the Presbytery of Emporia, the Synod of Kansas, and the Presbyterian General Assembly, and the personal care and attention given to the matter by Senator Dawes and Secretaries Teller and Lamar.

The details of the transportation, and location of the Nez Percés in the Northwest, were committed to Sec-

¹ See THE CENTURY for December, 1885.

retary Lamar, and to General Miles, who was then in command of the department of Columbia. In the face of border prejudices, and in opposition to local feeling, he came promptly to the front, exhibiting admirable moral courage and humane spirit in protecting and befriending the broken band of exiles whose military strategy and splendid courage along the Lolo Trail in 1877 challenged the admiration of the army and added new luster to the fame of the general in command, of Major Baird, his brave adjutant, and of all the officers and men who effected their defeat and capture.

Geo. L. Spining.

II. COMMENTS BY MAJOR BAIRD.

My knowledge of the facts respecting the return of the Nez Percés from the Indian Territory to the north-west included General Miles's urgent opposition to the quite unnecessary transfer of those Indians to the south, just after their surrender to him; his working through and with others, for a long period afterward, to effect their return to their own section of country, and the part borne by him in their final release from the — to them — most unhealthy region in the Indian Territory. I trust that I shall not wholly forfeit the favorable opinion of Mr. Spining by admitting that my knowledge did not include the honorable and, as appears from his note, efficient part borne by him in securing the result.

G. W. Baird.

III. THE FIGHT IN THE WOLF MOUNTAINS.

ON page 357 of his article on "General Miles's Indian Campaigns," Major Baird says of the fight in the Wolf Mountains:

Putting spurs to "old Red Water," Baldwin forced him at the run up the glassy hillside, and then, hat in hand and with a ringing shout, he newly inspired the weary men and, with the momentum of his own brave onset, carried them to the coveted crests.

Lieut.-Colonel E. Butler (U. S. A., retired), who commanded Company C of the Fifth Infantry in that battle, has called the attention of the editor to the above statement by Major Baird, and has submitted an affidavit by Patton G. Whited, who was a private and non-commissioned officer of his company, and a non-commissioned officer of Company B, Fifth Infantry, when honorably discharged at the expiration of his last term of service. Mr. Whited was given the congressional medal for gallantry in the charge at Wolf Mountain. In part he says:

On the morning of January 8, 1877, two companies, D and C, Fifth Infantry, were guarding the rear of the camp on Tongue River, when the command was attacked. D Company, Captain MacDonald, was ordered up on the table-land where the artillery was. Shortly after, Company C, Captain Butler, was ordered up and deployed as skirmishers along the edge of the table-land, supporting the guns. General Miles, after some conversation with Captain Butler, and after a wagon-bow on the caisson of one

of the guns had been struck by a ball from the Indians, said to Captain Butler, "Take your Company and take that hill," pointing to the highest point on the extreme left. Captain Butler moved his Company off by the left toward the hill, the base of which was about three-quarters of a mile distant. The table-land was cut off from the base of the hill by a ravine. I was about ten skirmishers from the left. Before I reached the ravine I saw Lieutenant Baldwin coming after us from the place where the artillery was, hat in hand, hallooing "Forward." He came up as far as I was, passed in front of me, turned around and started back at full speed. He never went within a quarter of a mile of the crest, never crossed the ravine at the base of the hill. The heavy fire and the charge did not take place until after he had returned to the guns. After this I crossed the ravine, and after crossing I went in rear of Captain Butler's horse; he, with his hat in his hand, calling, "Forward, forward, men." Lieutenant Baldwin did not come up as far to the left as Captain Butler was, by one hundred yards. Captain Butler said, "There they are," pointing at them, and ordered us to fire. Sergeant Coonrad, Corporal Johnson, Private McGinty, Burke of "G," and others and myself gave them a volley, and we made a dash up the hillside. The Indian fire was now very heavy from the hill. As we got out of the ravine, rising up the hill, Captain Butler's horse was shot. He dismounted and said, "Those who are blown, take breath; the others follow me," and then we charged the hill, drove the Indians off, occupied the crest and held it.

IV. REPLY BY MAJOR BAIRD.

ESPECIAL care was taken by me in collecting data for that account. The written descriptions of several of the most prominent actors in, and best-informed spectators of, that battle, one of whom has been carefully over the field twice since the battle, also the diary of one of them, kept at the time, were the sources of my narrative. All of those officers, as also several officers and enlisted men who were not consulted before the sketch was published, affirm the essential accuracy of the record as printed in the *JULY CENTURY*.

The battle was a most critical one, as the narrative sought to explain, and the period of it in question was its most critical point. At such a time there were many heroic deeds done, and my narrative failed to express my desire if it did not give honorable prominence to Captain Butler. But one officer who wrote of the battle, after describing the affair substantially as it appears in *THE CENTURY* article, said, "Baldwin's action was the most conspicuous act of dashing gallantry I ever witnessed, and I saw the whole charge from beginning to successful end. It seemed to me Baldwin deserved more credit than any other officer under General Miles in the battle."

Another officer said of Baldwin, "He dashed over and not only carried the order, but, waving his hat in advance of the troops, inspired them with renewed spirit and courage." The greatly preponderating weight of testimony favors the record as printed. In that, as in the account of other engagements in the sketch, a record of sufficient length to permit more of detail would have included many acts and names of actors well worthy of especial mention which are omitted, but that would have been a history and have required a volume instead of being a sketch within the compass of a magazine article.

G. W. Baird.

IN LIGHTER VEIN.

SONGS OF IRELAND.¹

BY JENNIE E. T. DOWE.

I Promised Me True Love.

I PROMISED me true love to love her for aye,
An' I think o' me true love one hour o' each day;
One hour o' each day, an' still she will fret,
An' says that sich loving is 'asy to get;
Is 'asy to get, an' och she won't see
If one colleen I love I can 'asy love three.

A kiss for me true love I've always to spare,
One hour o' each day—wid kisses I'm there;
One hour o' each day, an' still she will fret,
An' says that sich kissing is 'asy to get;
Is 'asy to get, an' och she won't see
If one colleen I kiss I can 'asy kiss three.

I talk about wedding, an' all she will say,
"An' sure is the wedding for one hour a day;
For one hour a day, now, Paddy, don't fret,
For a wedding wid me you never will get;
You never will get," an' och she won't see
If one colleen I wed I can 'asy wed—
[Begor, no, the law is agin wedding three]
Then och, she shall see,
When a colleen I wed,— that colleen she 'll be.

Her Little Feet so White an' Bare.

BEGOR, I got up 'arly afore the break o' day,
An' down across the dewy fields I lightly took me way;
I whistled an' I sung along, light-hearted as a grig,
Until the sun hisself got up, a-pullin' off his wig.
By all the saints an' holy powers what was it that I met?—
A colleen — none so fair as she, wid dew her feet were
wet;—

Her little feet so white an' bare, I said, "gin me a
pogue";
She said, "To meet a barefoot lass brings bad luck to
a rogue.

"So early, sir, you are abroad, no other you have met;
I'm sorry, sir, I came this way, bad luck to you to get!"
"My fairest one, my dearest one, my loveliest one," I
cried,
"Begone bad luck forevermore, wid you, me love, be-
side."

I kissed her once an' twice an' thrice; she blushed
nor turned away;

I kissed her o'er an' o'er again, until she named the
day.

We 're wedded, an' me barefoot wife each mornin'
first I see,
An' yet me pretty barefoot wife brings good luck
unto me.

There 's a Rogue in the Breast o' Your Coat.

I COORTED sweet Shelah for seven years an' over,
An' yit me sweet Shelah was ever a rover;
I coorted all night, an' I coorted all day,
An' yit wid sweet Shelah had never a way;
I coorted her 'arly, I coorted her late,
Seven days in the week, an' wished they were eight,—

But 't was always,

"Go way, Barney,

Get along wid your blarney,

There 's a rogue in the breast o' your coat."

Wheriver she went I was sure to be there,
At each wedding an' wake I'd love an' to spare;
I coorted her waking, I coorted her dreaming,

¹ See also this magazine for February, 1892.

I coorted her 'arnest, I coorted her seeming,
I coorted her 'ating, I coorted her drinking,
An' begor by me sowl I coorted her winking,—
But 't was always,

"Go way, Barney,

Get along wid your blarney,

There 's a rogue in the breast o' your coat."

I coorted her standing, I coorted her setting,
Wherever an' whin was a chance love to get in;
I coorted her riding, I coorted her walking,
I coorted her thinking, I coorted her talking,
I coorted her smiling an' frowning an' wreathing,
An' by the hole o' me coat I coorted her breathing,—

But 't was always,

"Go way, Barney,

Get along wid your blarney,

There 's a rogue in the breast o' your coat."

I coorted in new clothes, I coorted in old,
I coorted wid brass, an' I coorted wid gold;
I coorted wid scorning, I coorted wid hating,
I coorted wid fighting, I coorted wid b'ating,
I coorted wid English the brogue along fussing,
An' by Peter an' Paul I coorted wid cussing,—

But 't was always,

"Go way, Barney,

Get along wid your blarney,

There 's a rogue in the breast o' your coat."

I coorted sweet Shelah for seven years an' over,
Then I swore by the saints I'd Shelah give over;
The rogue in me coat I'd never found out,
If Shelah herself had not turned me about;
The darlint younneen is the rogue in me breast,
An' by the seven parishes there she shall rest,—

An' now 't is,

"Come along, Barney,

Never mind your blarney,

'T is Shelah that 's hid in your coat."

"It is the Cat."

FAIX, an' I built me a house,

An' I fashioned it jist to me mind,

Wid a pig-pen built on in front,

An' a pratie-patch built on behind.

'T was a swate little, nate little, swate little spot.
(But whin I wuz ather movin' from the ol' place to
me swate little, nate little, swate little spot, what did
that boy Barney—who wid the s'archin' of a thousan'
years would n't have a smithereen o' a brain—do?
Why, he put the cat in a bag, an' fur all the cat scratched
an' howled, an' did all a mortal cat could to git away—
fur she wuz cunnin' ez a lawyer, an' suspicioned how
as she wuz brought to the house bad luck would come
along wid her, yit into me swate little, nate little, swate
little spot kim that Barney a-luggin' the cat.)

Faix, an' I built me a house,

An' I fashioned it jist to me mind,

But there 's niver a pig in the pig-pen in front,

Nor a pratie a-planted behind!

Sich a swate little, nate little, swate little spot!

(For sure, an' if I planted praties they would grow
wrong side up, an' if I got me a pig, niver a soul could
tell what mortal beast he might turn into. Begor, an'
I'm afear'd to git up lest bad luck be overtakin' me,
an' I'm more afear'd to go to bed lest bad luck be
atween the two sheets! an' all bekase o' that cat comin'
to me swate little, nate little, swate little house!)

An Old Belle.

A DAUGHTER of the cavaliers
(A phrase a little dulled with years),
But something sweeter than them all,
Serene she sits at evenfall.

Tall tulips crowd the window-sill,
Vague ghosts of those that blew at will —
Ere she was old and time so fleet —
In some walled space down Camden street.

And straight — she and her lover there —
In that town garden take the air;
Tall tulips lift in scarlet tire,
Brimming the April dusk with fire.

Without, the white of harbored ships;
The road that to the water slips;
And tang of salt and scent of sea;
Within, her only love and she!

Back to the new she comes once more,
To roofs ungabled, ways that roar;
To the sole April left her still,
That potted scarlet on the sill.

Dust are those pleasant garden walls;
Her only love in green Saint Paul's;
Serene she sits at her day's close;
Last of her kin, but still a rose!

Lizette Woodworth Reese.

The Silent Partner.

HE had no thoughts, no winged words had I;
To conquer all defects we did combine:
He fledged my thoughts — now round the world they
fly,
But ah, the flock is counted his, not mine!

Edith M. Thomas.

Reflections.

WHEN a man is too lazy to walk around a mud-hole,
he should not be commended for bravery in walking
through it.

If you wish to scald your husband, or wife, as the
case may be, procure cold water and heat it before
using it.

CORRECT speech is correlated to right conduct and
cleanly living, and to neglect it is to foster a slouchy
and dangerous habit.

THE ravens of Providence come when least expected,
and are not addicted to the habit of encouraging laziness.

To brood over the past is to misspend the present,
and to jeopardize the future.

UNLUCKY is the man whose bread is buttered on
both sides.

BEWARE of excessive concealment that provokes ma-
licious guessing.

VULGAR wealth is a repellent thing, but it is entitled
to the forbearance, at least, of vulgar poverty.

IMAGINATION and memory seem to conspire against
some people by swapping functions at critical junctures.

THERE may not be a personal devil, but could an
impersonal devil carry out successfully such enormous
contracts?

J. A. Macon.

A Lover's Plaint.

SHE 's kind as she is fair; aye, there 's the rub!
If she far fairer were, and far less kind,
If she would flout me with keen scoff, and snub,
I might sweet prescience take, for Love, though blind,
Knows, pierced with pains, and hurting sore despairs,
His rose is near, by the sharp thorns she bears.

She 's kind as she is fair. That 's saying much —
Too much, alas! for my poor beggared heart.
Her tender eyes, her frank and friendly touch,
Give me no joy, but, rather, deeper smart;
And seem to whisper brightly, "Fool, beware,
She 's only kind because she is so fair."

She 's kind as she is fair. Ah, would that she
Were half as fair, or half as sweetly kind!
Hope might more hopeful of attainment be,
Nor humbled passion kneel so far behind.
But if less fair, would she such kindness wear,
Or if less kind, would she still be so fair?

She 's kind as she is fair, alas! and hence
I make my sad adieu, and go my way,
For want of sterner warning, driven thence
By words too soft, by smiles too bright and gay,
Yet knowing this, if I were to her mind,
She could not be too fair, much less too kind.

Mary Ainge DeVere.

The Lost Song.

I PLUCKED a wild flower from the river's brim,
And drank a while its faint but fragrant breath,
Then cast it forth upon the wave a-swim,
And watched it, as I fancied, drift to death.
"T is lost," I said; but far adown the tide
A tempted maiden saw its dainty hue;
She snatched it, kneeling at the water side,
And vowed, "I will be pure, sweet flower, like
you."

And I, I never knew.

George Horton.

Only a Hint.

Now that tales of "Californy"
For the nonce our eyes engage,
And the 'Forty-niner's horny
Hand is seen on history's page,
Let me draw an illustration
From his novel way of life
That may be a revelation
To the maid who would be wife.

Gold was in the gravel hidden —
That was known beyond a doubt;
O'er the plains were hobbies ridden
Guaranteed to get it out;
But they perished in the trying,
And 't was found the only plan
That succeeded was relying
On a simple little pan.

You who would my thought unravel
With this axiom should start,
"Like to gold within the gravel
Oft is love in manly heart."
You who would be gold extracting,
Gold of love from heart of man,
All your arts in one compacting
Learn the handling of the pan.

George Moore.

"LA BELLA," BY TITIAN.

THE CENTURY MAGAZINE.

VOL. XLIII.

FEBRUARY, 1892.

No. 4.

THE NEW NATIONAL GUARD.

THE centennial celebration in New York of Washington's first inauguration revealed to more than a million astonished spectators a force of over 30,000 soldiers, well armed, equipped, and drilled, of whom not more than 2000 were in the service of the United States. It was the largest body of armed men assembled on this continent since the close of the civil war, now nearly a generation ago. It was the largest force of militia ever paraded in this country. It was a force whose methods of organization and support are unlike those of any other military system; and its present condition of excellence is the result of barely more than a dozen years of well-directed effort. The purpose of this article is to explain as briefly as possible the origin and present condition of this force, the objects of its existence, and the extent to which these objects have been realized.

During the closing year of Washington's life, after the machinery of the new government under the Constitution was in full operation, there were four measures which he advocated on all proper occasions with his usual dignified but forcible language. These were the opening of commercial highways to the West, the founding of a national university, the establishment of a military academy, and the organiza-

tion of an efficient militia. None of them were realized during his lifetime, and the national university is still only a matter of discussion. The Military Academy was founded in 1802 and thoroughly organized in 1814, after the defeats of the war of 1812 had still further emphasized the necessity for its existence. It has since so clearly demonstrated its utility that no one now seriously questions the advisability of maintaining it. The problem of Western communications was first partially solved by Clinton in opening the Erie canal in 1825, and the solution has been completed by railways in a manner and to an extent of which Washington never dreamed. The militia "upon a regular and respectable footing," for which Washington so often pleaded, and which is the only one of these four projects to which reference is made in the Constitution, is just becoming a reality, ninety years after his death.

Concerning the militia, as concerning other military matters, Washington's opinions were radically different from those of most of his contemporaries in politics. What he had in mind was a force uniformly organized, armed, equipped, and clothed throughout the several States, and as thoroughly trained and disciplined as the circumstance of their military service being other than the principal object of their lives would permit. His long military experience had impressed upon him the immense advantage of training and organization. On the other hand the members of the Continental Congress and the Constitutional Convention were thoroughly imbued with jealousy of a standing army, which is one of the most strongly rooted

Copyright, 1892, by THE CENTURY CO. All rights reserved.

prejudices of the Anglo-Saxon race. They looked askance at too much discipline and too thorough organization, and in military matters they relied above all upon patriotic enthusiasm.

Their ideal of a soldier was the minute-man of '76, who provided his own arms, was practically without uniform or training, belonged to the great body of the population and not to a class apart, and came forth in an emergency to fight with all his will, but returned to his ordinary avocation the moment the emergency was passed—and not infrequently reserved to himself the right to judge when that moment had arrived. With such a soldier in view—and there are some instances of his success in the Revolution along with many failures—the framers of the Constitution gave no small prominence to the militia in their scheme of government. In the Bill of Rights, side by side with such fundamental doctrines as the rights of petition, peaceable assembly, and freedom of speech, it is recited that a well-regulated militia is necessary to the security of a free State. Congress is authorized in the eighth section of the first article to provide for organizing, arming, and disciplining the militia, to call it forth to execute the laws, suppress insurrection and repel invasion, and to govern such part of it as may be so called forth into the service of the United States. To the States was reserved the right to appoint the officers and to train the militia according to the method prescribed by Congress.

In spite of the ample authority thus given to Congress, and the evident intention that the militia should play an important part in the constitutional government, Congress has done little or nothing to provide an efficient militia. It called out the militia in 1812, and in some of the Indian wars, but only to see it, on account of its lack of organization and training, ignominiously defeated, except when under command of a natural leader of great force like Jackson. In the space of a hundred years Congress has passed but sixteen laws relating to the militia, and of these only five were of more than temporary importance. The first, in 1792, provided for its organization, substantially on the basis proposed by Knox in his report of 1790; the second, in 1795, conferred on the President the right to call forth the militia in cases of invasion or rebellion, and the Supreme Court decided in 1827 that it belonged exclusively to the President to judge when such an exigency existed, and that his decision was conclusive upon all other persons; the third, in 1808, passed at the urgent solicitation of Jefferson, made a permanent annual appropriation of \$200,000 for its armament and

equipment; the fourth, in 1820, required the militia to observe the system of discipline and field exercises which is prescribed for the regular army; and the fifth, in 1887, increased the annual appropriation to \$400,000.

The various presidents from Washington to Tyler, each in succession and almost year by year, urged upon Congress the desirability of a more efficient militia law; numerous projects were discussed, but none was enacted. For the last ten years legislation has been pending in behalf of the modern militia which has grown up in spite of the neglect of Congress, and many reports of committees have been made, but still the quaint and obsolete law of 1792 remains unrepealed in the book of Revised Statutes, and is to-day the law of the land.

This law requires every able-bodied male citizen between eighteen and forty-five years of age to "be enrolled in the militia." The enrolment is to be made by the captain of every company sending notice "by a proper non-commissioned officer" to "every such citizen residing within the bounds of his company." After his enrolment the citizen is to "be constantly provided with a good musket or fire-lock, of a bore sufficient for balls of the eighteenth part of a pound, a sufficient bayonet and belt, two spare flints," and many other articles which can now be obtained only by loan from a museum of antiquities. The officers are to "be armed with a sword or hanger and spontoon." The citizen "shall appear so armed, accoutred, and provided when called out to exercise or into service." The act then goes on to specify at length the organization of regiments and batteries, the number of officers, and their respective duties.

It is thus seen that under the law of the United States as it exists to-day—which, however, is in direct conflict with the law of the State—the captain of any militia regiment in New York can enroll all the able-bodied citizens of that city in his company, and call upon them to attend muster and drill, duly provided with flint-locks and powder-horns.

The theory upon which this law was framed was the theory of individual armament and equipment, and of universal service (not merely liability to service). It has been a complete failure from the day of its enactment, and has never been observed in any of its prescriptions. The militia, as it existed during the first half of the last one hundred years, consisted of independent companies, each having its own name and organization, and its own methods of drill and equipment, whose principal function was to "train" in its own village as part of the Fourth of July or other celebration. The companies were seldom, if ever, brought together for camp or instruction, and were deficient in the first

principles of practical military knowledge. The very name of militia fell into a not undeserved contempt after the war of 1812, and the whole system passed out of existence some years before the war with Mexico.

The fundamental error of this system was in requiring service from all able-bodied citizens. The enforcement of this requirement was neither possible nor desirable. This defect was recognized immediately after the passage of the act, and as early as 1794 a bill was introduced, providing for "a select corps which should be armed and equipped by the general Government, and paid for service in annual

legislatures. Organizations were formed in the various States, in limited numbers, of volunteers, and these sought and obtained recognition from their legislatures. These organizations partook in some measure of the nature of athletic clubs, but were not unmindful of the military purposes

for which they existed. The States gave them arms and equipments received from the general Government, and in some instances supplemented these by appropriations of their own. Many of these organizations particularly excelled in the manual of arms and company drill, but in the more important military duties of camping, marches, guard duty, manœuvres, and rifle-practice they had no experience. Yet the members of them rendered most valu-

camps of instruction."¹ This bill was not passed, but the same idea in various forms has been recommended to Congress and discussed from time to time ever since, and is the guiding principle of the act which was introduced but failed to pass in the last Congress. Failing, however, to gain any encouragement from Congress, this idea was adopted in the State

¹ "History of the Militia Law," in the report of the Committee on the Militia, United States House of Representatives, March 13, 1890.

able service as officers of volunteers both in the Mexican and civil wars—the 7th Regiment of New York, for example, having furnished no less than 667 men, and the 1st company of cadets of Massachusetts 150 men, of all grades from private to major-general, to the Union armies of 1861–65. With the rapid increase of urban population, the growing taste for outdoor and athletic sports, and the manifest advantages of club association, these volunteer organizations increased in numbers and in popularity. At the same time, however, there grew up a tendency to make the organi-

arms, and equipment of the United States army were adopted as far as possible; rifle-practice was rigidly required; additional armories were built for drill in winter, and camps of instruction were provided for field exercises in summer; the military codes in all the States were thoroughly revised and made as nearly uniform as possible; the courts martial were recognized by the laws of the State and as firmly established in their limited jurisdiction as any other courts, and the civil power of the sheriff and the marshal was invoked to carry their sentences into effect.

FIELD MANŒUVERS.

zation top-heavy, the number of generals and staff-officers being out of all proportion to the strength of the rank and file. This had reached its maximum just before 1877, when the militia was called upon to meet, in the railroad strikes and riots of that year, the most serious of those emergencies for which it chiefly exists. It failed to accomplish what was expected of it, and was mortified to see a handful of regulars under General Hancock easily overcome a resistance which had been too powerful for the national guard of an entire State. A reorganization on a practical military basis was soon undertaken in all the seaboard States. Great numbers of generals were retired; the organization, uniform,

In this work the Atlantic States, and particularly Pennsylvania, Massachusetts, New York, New Jersey, and Connecticut, have taken the lead; from them the movement has spread among the lake cities, and, more recently, in the South and extreme West. Every State in the Union has revised its military code since 1881, and in all but seven States there is now an organized, uniformed, and armed national guard,¹ of greater or less strength, in proportion to population and wealth. The general result is to produce the beginning and in some measure the fulfilment of Washington's plans for "placing the militia of the Union upon a *regular and respectable* footing." The day of the patriotic

¹ The name "National Guard" was first assumed by the 7th Regiment (then the second battalion of the 11th Regiment New York State Artillery) on the occasion of Lafayette's visit to New York, August 16, 1824. It was held exclusively by that regiment until 1862, when the legislature gave the name to the entire force of organized militia in New York. (See "Clark's

History of the 7th Regiment," Vol. I, p. 105.) The name has since been adopted by a majority of the States.

In Massachusetts and some other New England States the troops are called "Volunteer Militia"; in Virginia, "Volunteers"; in other Southern States, "State Guard" and "State Troops."

but untaught minute-man belongs to the past. The modern militia is organized more in accordance with the ideas expressed so clearly by Washington in his letter to the governors of all the States, written from Newburg on the disbanding of the army in 1783, in which he says:

The militia of this country must be considered as the palladium of our security, and the first effectual resort in case of hostility. It is essential, therefore,

present there is a well-organized battalion of this character in Massachusetts and another in New York, each about three hundred strong and divided into four divisions. Both are commanded and officered by ex-officers of the navy and graduates of the Naval Academy. They are instructed during the winter at armories in the drill of the battalion as a landing-party, with muskets and boat-howitzers, and also on board training-ships in the use of large guns.

IN CAMP—COMMANDING OFFICER'S QUARTERS.

that the same system should pervade the whole, that the formation and discipline of the continent should be absolutely uniform; and that the same species of arms, accoutrements, and military apparatus should be introduced in every part of the United States. No one who has not learned it from experience can conceive the difficulty, expense, and confusion which result from a contrary system, or the vague arrangements which have hitherto prevailed.

Within the last few years a new branch of the militia has been founded in the seaboard States, under the title of "Naval Reserve." At

During the last summer each battalion hired a steamer, on which the regular routine of a man-o'-war was rigidly enforced. The Government placed its finest squadron of new cruisers, with modern guns, at their disposal for instruction.

The naval-reserve steamer for the Massachusetts battalion was attached to the squadron in Boston harbor, and in Long Island Sound for the New York battalion. A week's hard work was performed with a surprising amount of enthusiasm. The men were instructed in the use of great guns, and acquitted themselves at ocean target-practice with credit not

FIELD ARTILLERY—IN BATTERY.

inferior to that of the regular crews of the squadron. They were also constantly exercised in boat-drill and in a successful landing-party.

In view of the difficulty of obtaining officers and instructed men for the volunteer navy in time of war, this most recent application of the principle of the volunteer militia affords the promise of very great usefulness in the future.

The annual return of the militia for 1890 gives the strength of the "unorganized" force as 7,691,987. This is a mere census statistic, and is the number of able-bodied men liable to military duty. In some States it is determined by actual enrolment, and in others it is estimated.

The organized militia numbers 109,674, or 9000 officers and 100,000 men. The average attendance at camps, as reported by the adjutants-general of States, varies from 75 to 95 per cent., but in some of the States in the South and West there is no provision for armories or encampments, and the troops have not yet attained such organization or instruc-

tion in military duties as to make them valuable in an emergency. The armed force of the States which can be relied upon is therefore probably between 70,000 and 80,000 men. The total force is distributed as follows:

In the States of Massachusetts, Connecticut, New York, New Jersey, and Pennsylvania, available for prompt concentration at any point between Boston and Harrisburg, . . .	34,800
In the other Atlantic States from Maine to Virginia,	11,400
In the States along the lakes and Upper Mississippi, available for prompt concentration in Chicago, St. Louis, or other central cities. .	23,100
In the South,	25,500
In the West,	7,100
On the Pacific Coast,	7,700
	109,600

This distribution, and other statistics of the militia, are shown more in detail in the table given below.

The annual cost of maintaining the United States army is about \$1000 per man. The armies of Europe cost from about \$450 per man (in England) to \$125 per man (in Russia). The

States and Territories.	Population.	Annual Expenditure by U. S.	Annual Expenditure by States.	Organized Militia.	Organized Force per 100,000 of Population.	Cost per Unit of Population.	Cost per man of Organized Force.

OVERCOME BY HEAT: A CASE FOR THE MEDICAL CORPS.

organized militia cost a little less than \$24 per man, of which the general Government contributes one sixth and the States five sixths. Officers and men give their services free (except a nominal pay while in camp), and contribute for uniforms, traveling expenses, and other purposes an amount which probably exceeds the amount paid by the States.

It will be noticed that the Southern States spend less for their militia than they receive from the general Government; while in the West the Government contribution is only about one third of the total cost, in the Central States about one fifth, in certain Eastern States one sixth, and on the Pacific Coast and in the vicinity of New York the States pay fourteen times as much as the general Government. This proportion is even greater in New York, for the cost of constructing expensive armories¹ is not included in the expenditures given in that State, whereas in other States the cost of renting armories is included as part of the expenses of

maintaining the force. The largest expenditure in proportion to population in any State is in Connecticut, where it is nearly fifteen cents per inhabitant. In some of the Southern States no appropriation is made.

¹ In 1889, in addition to \$400,000 for the expenses of the National Guard, the State of New York spent \$553,332 for armories (exclusive of those built in the city of New York which are paid for by the city) and \$125,000 for pay, transportation, and subsistence of

her 12,000 men who took part in the centennial parade. The total appropriations for the year in New York were thus \$1,078,332. In Massachusetts and some other States the cost of erecting armories is a charge upon the city or town, and no statistics of such cost are available.

The Government contribution can be drawn only in arms, equipments, and equipage, and not in money. It is distributed to the Territories in such proportions as the President may direct, and to the States in proportion to their representation in Congress, but nothing is avail-

four guns each. A few of the batteries have the new 3.2" steel breech-loading gun, and many of them have Gatlings; but most of the guns in the hands of the militia are the 12-pounder brass Napoleons, or the 3-inch iron rifles of 1863. In addition to the guns with

A STREET PARADE.

able for any State where there are less than one hundred organized and uniformed men for each senator and representative. The relative efficiency of the troops in different States is closely proportionate, up to a certain limit, to the money expended on them by the States themselves.

Of the total force about 94,000 are infantry, 5500 artillery, and 7000 cavalry. About one half of the force in New Mexico and in South Carolina is cavalry, and the proportion of this arm in all the Southern States is much greater than in the Northern. In many States there is no cavalry organization, and in New York, with a force of 14,000 men, there is only one troop of cavalry. Of artillery there are in the various States about sixty batteries, usually of

the batteries, there is at nearly every State arsenal a miscellaneous collection of old guns of various ages, most of which it would be dangerous to use with projectiles.

The usual proportions of the three arms in an army in the field are cavalry one sixth of the infantry, and artillery three pieces to 1000 infantry. But the enormous expense of maintaining or even hiring horses makes it out of the question for the militia to keep these proportions. Nor is it at all necessary, for their principal service is not in the field, but in supporting the civil authorities in maintaining order in large cities, where cavalry is practically useless, and artillery can be used only in small numbers.

In the National Guard, even more than in an army, the infantry constitutes the bulk of the

efficient force. In all the States the company is the unit of organization, but they are usually organized into regiments of ten companies each, and in most of the States into brigades of three to five regiments. In Pennsylvania the entire force constitutes a single division with three brigades and fourteen regiments. In New York there are four brigades without a common commander, except the governor and adjutant-general; the brigades contain fourteen regiments and forty-four separate companies. In Massachusetts, Illinois, and New Jersey there are two brigades each, and in many other States the entire force constitutes a single brigade. In Ohio, with eleven regiments, eight batteries, and one troop, there is no brigade organization. In New Jersey there is a division with two brigades, seven regiments, and three separate battalions.

In the matter of armament there is a diversity which would prove disastrous if the troops of different States should serve together in the field. In New York the Guard is armed (at the expense of the State) with the Remington, caliber .50, in Connecticut with the Peabody, caliber .43; in some of the States are still to be found some of the Springfield, caliber .50. With these exceptions, the troops are armed with the Springfield, caliber .45. As the army is on the point of changing its rifle for one of smaller caliber and probably of the magazine pattern, it is not desirable to change the armament of the National Guard until the new rifle is adopted. But at that time it would seem that the Government should promptly replace all the old guns and ammunition in the hands of the militia with new material.

In uniforms the entire National Guard, with hardly an exception, has now a service uniform closely resembling (and in many cases exactly like) the undress uniform of the army. For full-dress uniforms some regiments, like the 7th in New York, have a distinctive uniform to whose history they are attached; others have the full-dress uniform of the army, and some have no full-dress uniform at all. But in all cases the former tendency to gaudy and unserviceable uniforms has been entirely eradicated. The fault, if any, in the uniforms is too much simplicity. In all armies the picked regiments and corps have special full-dress uniforms, often quite unlike, even in the same army; their history is associated with these uniforms, and they have a positive military value in pro-

THE SIGNAL CORPS.

moting regimental pride and *esprit de corps*. The gray uniform of the cadets at West Point, which has not been changed, except in head-gear, for over seventy years, is of this character, as is also that of the 7th Regiment in New York. It would be well if each regiment, or at least each State, had such a distinctive uniform for full-dress, but all having the same undress or service uniform.

It has previously been stated that the legislatures of all the States have revised their military codes since 1881. These new laws are perhaps as nearly uniform as the laws of the different States on any other single subject. Certain fundamental principles are to be found in all of them, and the most important is the division of the militia into two classes, one of which is the active or organized force, and the other is the mass of able-bodied citizens liable for military service. The active militia is composed wholly of volunteers, compulsory service being authorized only in time of war or invasion. The maximum strength is fixed by law, and in most of the States the applications for formation of new companies are much in excess of the legal limit. The enrolment of able-bodied citizens liable to military service (the unorganized militia) is in most States made every year by the tax-asses-

sors, and the return is made by them under oath to the adjutant-general. In Connecticut there is an excellent law under which all those enrolled and not serving in the active militia pay an exemption tax of two dollars. This pays all the military expenses, and enables Connecticut to make the comparatively large expenditure above mentioned. Such a tax in all the States would produce a fund of about \$14,000,000 in the aggregate.

The next point in common is the exemption of the active militia from jury duty and poll-tax except for schools. The principle of electing officers is common to all the States, except that in Pennsylvania and Connecticut general officers are appointed by the governor and confirmed by the Senate, and in Illinois, Michigan, and Vermont they are appointed by the governor alone. In New Hampshire all officers are appointed by the governor and council. With these exceptions, the officers are always elected by ballot: generals by the field-officers, field-officers by the company officers, and company officers by the enlisted men of companies. Governors appoint their own staffs, and the staffs of brigades and regiments are appointed on the recommendation of the generals and colonels with whom they serve. In some States officers hold their commissions during good behavior, in others for periods of five or three years. In many States officers are appointed only after examination by a board of officers as to their fitness; and in New Jersey whenever the division commander reports that any officer is unfit for his position, the commander-in-chief may place him on the retired list and declare a vacancy. Had such a law existed in New York, it would have saved many recent scandals which have tended to demoralize the service. In nearly all the States the commander-in-chief has the power summarily to disband any company which fails to reach a certain standard of numbers or efficiency at inspection.

Enlistments are usually for three years, but in some States for five. The system of drill is invariably the United States Tactics, and in several of the States there are complete sets of regulations issued in pursuance of law, and conforming as closely as possible to the United States Regulations. The arms and equipments are issued by the States, and are public property, kept in public armories. The uniforms are sometimes furnished by the States, but more frequently by the individuals, the State contributing a specified sum of money in partial reimbursement. In nearly all the States the assembling or parade of armed bodies other than those belonging to the regularly organized militia, or National Guard, is prohibited under heavy penalties.

In all the States there are elaborate provisions for courts martial for the punishment of military offenses, but in many of them the manner of enforcing the sentences of these courts is not clearly defined. The laws of New York, New Jersey, and Pennsylvania, however, leave nothing to be desired on this score. Most of the sentences are fines, and there are also statutory punishments for absence and neglect of duty, which are imposed without the necessity of trial by a court. In Pennsylvania the president of the court issues his warrant direct to the sheriff of the county where the court is held, and the sheriff is required to collect the fine in the same manner as debts are collected on civil process; the sheriff is to make his return within twenty days, and if no goods are found, the president of the court issues his writ of commitment of the delinquent to the county jail. In New York the president is authorized to appoint a marshal of the court, who shall perform the duties of a sheriff, or he may issue his warrant direct to the sheriff, and in default of payment may commit to jail, but the imprisonment shall not exceed twenty days. In New Jersey the collection of fines is intrusted to paymasters, to whom they are duly certified; and if the fines are not paid, the paymaster puts the return into the hands of the county judge or justice of the peace, and he issues an execution directed to the sheriff by whom the fine is to be collected, but it is especially provided that no person shall be imprisoned for a militia fine in time of peace. In Michigan, for the punishment of minor offenses, complaint is entered by the company commander before a justice of the peace, who causes the offender to be arrested and brought before him for a hearing. If satisfied that the forfeiture has been incurred without good cause, he imposes the fine and issues his execution, but in default of payment imprisonment is limited to two weeks, and cannot be inflicted on any delinquent less than twenty-one years of age. This form of procedure takes the place of the Delinquency Court of New York. Graver offenses are tried before a general or regimental court martial, and the sentences "may be confirmed and carried into execution by the officer ordering the court," but the precise manner of doing so is not specified.

In thirty-three States the laws provide for an annual encampment of various length, from four to fourteen days. In all but three of these States provision is made for paying part or all of the expense of the encampment by the State. In some cases this is limited to the actual expenses of transportation, but in others subsistence is also furnished, and the officers and men receive pay for the time they are engaged in this service at a fixed rate per day.

From this brief examination of the principal features of the military laws of the different States it is seen that while these laws differ in details, yet the same general principles run through them all. Year by year the laws tend to become more and more uniform, each State adopting those features which have proved beneficial in other States, and rejecting those which under the test of experience have proved unsatisfactory. By this method of natural selection will be attained in due time that uniformity of system, of formation, and of discipline which Washington advocated.

The practical result of these laws, in the States where they have reached their highest

are of nearly equal strength, by a brigadier-general, brigade headquarters being at Philadelphia, Franklin, and Lebanon. All orders and correspondence are invariably transmitted through the proper military channels.

The troops are armed with the United States Springfield rifle, caliber .45, and wear the undress uniform of the United States army. They have no full-dress uniform. During the winter they drill in their armories in the evenings, not fewer than four times a month, in the school of the soldier, the company, and the battalion. In the spring each regiment is carefully inspected by the brigade inspector, and a minute report made of its condition in all military re-

RIFLE-PRACTICE AT THE 7TH REGIMENT ARMORY.

development, may be best stated by comparing the National Guards of New York and Pennsylvania. In these two States the organization and training have proceeded on somewhat different lines, each of which has its advocates, and for each of which there is much to be said.

In Pennsylvania the whole force is a unit, a compact division which can be relied upon to put eight thousand men at any point within the commonwealth on notice of forty-eight hours or less. The governor is commander-in-chief and has his own administrative staff, most of whom are paid officers. The division is commanded by a major-general, with headquarters at Philadelphia, and each of the three brigades, which

spects, and its figure of merit is determined according to certain clearly defined rules. In July they all go into camp for six days, one year by regiments in the vicinity of their homes, the next year by brigades in different parts of the State, and the third year by division. In 1884 the division encamped at Gettysburg, in 1887 and 1890 at Mount Gretna near Lebanon. The men pitch their own tents, draw rations from the Commissary Department, and cook their own food. The time in camp is occupied in rifle-practice, guard duty, regimental and brigade drill, inspection by the adjutant-general, and review by the governor. It is no holiday picnic, but six days and nights of the hardest

possible work, regardless of weather, yet the percentage of "present" is about ninety-two per cent. of the total strength, and the work is performed not only without complaint, but with enthusiasm. The Guard is popular throughout the State, and corporations and other employers encourage the attendance of their employees at the camp. The work done in rifle-practice is shown by the qualification of about 600 "sharp-shooters" and 4000 "marksman," all qualified in strict accordance with the rules prescribed and followed in the army. At each camp one or more officers of the army are detailed as inspectors to report to the War Department. At the brigade and division camps detachments of infantry, cavalry, and artillery from the regular army are sent to form part of the camp and provide an object-lesson for the instruction of the Guard. The triennial encampments of the division are invariably inspected and reviewed by the commanding general of the army, and frequently by the President of the United States.

In New York the governor is commander-in-chief, with his staff of administrative officers, some of whom are paid as in Pennsylvania, but there is no commanding general. The adjutant-general has the rank of major-general, and is senior to all other officers in the Guard. In the lack of a division commander, he exercises many of the functions of a commanding general. The troops are formed into four brigades, with headquarters at New-York, Brooklyn, Albany, and Buffalo respectively; but the strength of the brigades is unequal, the first brigade having forty per cent. of the entire force and the fourth brigade only fifteen per cent. The troops are armed with the Remington rifle, caliber .50, which cannot use the Government ammunition. They all have an undress uniform, and in addition each regiment has a full-dress uniform of its own, many but not all of which are identical. During the winter they drill in the evenings in their armories, which are larger and superior in every respect to those possessed by any other State; in fact such magnificent covered drill-houses are not to be found anywhere else in America or in Europe. These armories afford facilities for gallery rifle-practice which are fully utilized. In the spring every regiment or company is inspected and mustered by the inspector-general at the armories, and ordinarily there is a street parade on Decoration Day. The city of New York has in Van Cortlandt Park a training-ground of over 1000 acres, sufficiently large for manœuvring a brigade in practical field-exercises, and containing in one part a level parade-ground of nearly 100 acres, recently completed at an expense of \$90,000, and probably the finest drill-ground of its kind in the world. This park

affords such favorable opportunities for field-exercises that probably such exercises and a brigade review will form part of the routine of duty every spring hereafter. During the summer and autumn there is constant rifle-practice for the first two brigades at the State range at Creedmoor, and for the other two brigades at other ranges scattered throughout the State. The number of sharp-shooters is about 250 and of marksmen 4600. In July a portion of the troops go into camp for seven days. The State owns a permanent campground near Peekskill, on the Hudson, where the tents are pitched by employees, comfortably floored, and remain standing throughout the camp season of six weeks. There is also a permanent mess-hall, erected at a cost of \$26,000, where the men are fed by a caterer and hired cooks. The camp will accommodate about 1200 men, and in six weeks about half of the regiments can have their turn, each one week at a time. Thus each regiment or company has a turn of camp duty once in two years. The number "present" averages only seventy-five per cent. of the total, the feeling of the employers in New York toward their employees in regard to absence for this service being quite different from that existing in Pennsylvania. The adjutant-general is in permanent command of the camp as a post, and has a permanent post-adjutant and special instructors in guard duty and other exercises. An officer of the army is always detailed, for the whole period of the camp, to report to the War Department. No time is wasted in reviews, formal inspections, or rifle-practice. All these are performed at other times and places. The whole period of the camp is devoted to guard and outpost duty, battalion and skirmish drill.

The two systems of organization and instruction thus outlined are quite dissimilar. In Pennsylvania there is a unit—the division—with its subordinate organizations and well-defined military channels. In New York there is a collection of regiments and "separate companies" which are seldom brought together, and many of which do not see each other for years. The practical instruction in mobilizing, transporting, and supplying the Pennsylvania division is invaluable to the staff. The education in the hardships and discomforts of a soldier's life, and in taking care of one's self when removed from the sphere of the landlord, the tailor, the butcher, the grocer, and the baker, is equally invaluable to the company officers and men. The experience of seeing large bodies of troops assembled and commanded in proper manner gives an idea of the ultimate end and aim of all military instruction, which can be gained in no other way. All this the Pennsylvania system provides in some measure, and the New

INDOOR CAVALRY PRACTICE — SHOOTING AND CUTTING AT THE HEADS.

York system not at all. On the other hand, this is gained at the expense of proficiency in details. The New York troops are better "set up," present a smarter appearance, are much more thoroughly drilled in the school of the company and battalion, have a better knowledge of guard and outpost duty, are more observant of military courtesy,—in short, are in every way better drilled as regiments. In Pennsylvania some of the governors, all of the general officers, and many of the colonels have been veterans of the civil war; they keep in close touch with the army and its principal officers, and they pride themselves on being practical soldiers and not merely men of parade. Their model is the veteran volunteers of 1865, than which none could be better; but in following this ideal too many of the men mistake a slouchy appearance, a lack of discipline, and a disregard of cleanliness in camp for evidences of their practical knowledge. Unconsciously they imitate the bummers instead of the veterans. In New York, on the other hand, the propor-

tion of officers who served in the civil war is much smaller, the men as a rule are possessed of more means, the State spends much more money in providing them with armories and other facilities, and their minds are more closely occupied with the minor details of drill. Their ideal is not so much the veteran volunteer as the 7th Regiment, which has for fifty years maintained its reputation as the best-drilled body of soldiers in the whole country, with the single exception of the West Point cadets.

There are merits and defects in both systems, and the true ideal is to be found in accepting what is good and rejecting what is bad in both. The Pennsylvania troops can adopt, with great advantage to themselves, the neatness and the proficiency in drill and details of the New York men; and if these latter could add to their knowledge of the drill-book the better organization of the Pennsylvania troops and their practical experience in massing and handling large bodies in the field and in the routine of camp, as it is carried on in actual service, they would

LAST HONORS.

form a corps which would compare favorably with regular armies. Whether with the limited time at disposal the two systems can be combined is a question which admits of doubt, but there can be no doubt that the effort of all the National Guards should be in this direction.

The objects for which the militia is maintained, so far as the Federal Government is concerned, are clearly defined in the Constitution, "to execute the laws of the Union, suppress insurrections, and repel invasions." But the militia is very much older than the Constitution, and its primary object always was, and still is, to aid the civil authorities in maintaining the law within the States, in those cases where the ordinary means—the sheriff, the constable, and the police—are insufficient. The States are prohibited from keeping troops in time of peace without the consent of Congress, but this consent was given by the Act of 1792, authorizing the organization of the militia into "divisions, brigades, regiments, battalions, and companies, as the legislature of the State may direct," and the consent has never been withdrawn except by the Act of March 2, 1867, which for a time prohibited nine States lately in rebellion from maintaining an organized militia.

The militia has thus a twofold allegiance—first, to the State, to assist in maintaining order,

and, second, to the general government, to suppress insurrection and repel invasion. But outside of its legal duties to the State and nation, the militia has a well-defined status in the military policy which has grown up in a century of experience, and which, while not prescribed in any statute, is quite permanently established. This system comprises, first, a small *regular army*, to aid in the settlement of the country by affording protection against Indians, to serve as a training-school for officers, and to provide a nucleus for the large armies necessary in time of war; second, the *militia*, to aid the civil authorities in maintaining order, to serve as a secondary training-school for officers, and to act at decisive points on the outbreak of hostilities; third, large armies of *volunteers*, enlisted for the period of the war, officered principally from the regular army and the militia, and upon whom fall the hard fighting of the war, and the conquering of a peace, almost to the exclusion of the regular army and the militia.

Our history shows that this military system, which has replaced the method of relying upon an unorganized militia which produced such disaster in the war of 1812, is well adapted to our situation and requirements, and it is approved practically without dissent. In the two subsequent wars each of the three branches, the regulars, the militia, and the volunteers,

performed its allotted part. In Mexico the regular army sustained the bulk of the fighting, but it was assisted by a considerable body of volunteers, who at Buena Vista and elsewhere rendered most gallant and admirable service, and the officers of these volunteers had largely gained their military training in the militia. In the civil war, at its outbreak, the capital was saved from occupation, and communication between it and the North was maintained, by the militia of New York and New England. It is difficult to overestimate the value of the service thus rendered in gaining time for the organization of the volunteer armies by whom the war was to be fought.

In any future war the militia will doubtless play the same part. At the outbreak its best brigades and regiments will be sent to decisive points, to hold these until volunteers can be organized to take their places. After that is accomplished they can render greater service by furnishing instructed officers to volunteer regiments, and thus disseminating their military knowledge, than by acting as military regiments. At no previous period of our history have we had so large a body of militia capable of rendering efficient service at the beginning of hostilities, or so many men available, by reason of their military instruction and enthusiasm, for officers of volunteers.

Yet, while this is true, much remains to be done and can be done still further to improve the efficiency of the militia. On a previous page it has been shown that the annual cost of the militia is about four cents per unit of population, and that in the States where the militia is most thoroughly organized the general Government contributes but one fourteenth part of this. It is evident that the general Government should give a larger portion, and should couple its donation with a more rigid inspection by its own officers as to the efficiency of the force to whose support it contributes. At present it divides its money among the States according to their representation in Congress, regardless of the condition of the force in any State, provided only that this force is reported "organized and uniformed" to the extent of one hundred men for every senator and representative. The Government might well make its assistance dependent on the number of men present in camp, fully armed and equipped and instructed in drill and rifle-practice, as determined by its own inspectors according to certain definite standards. The total amount of the Government contribution is also much too small. In 1808 it provided \$200,000 for this purpose, which was $1\frac{1}{4}$ per cent. of its total revenue, and $2\frac{3}{4}$ cents per unit of the population of that date. At present $1\frac{1}{4}$ per cent. of the total revenue would be \$5,000,000, and $2\frac{3}{4}$ cents per unit

of population would be \$1,722,000. Such sums are not necessary; but something more is necessary than the \$400,000, or one tenth of one per cent. of its revenue, which the Federal Government now contributes to the militia. The bill which failed in the last Congress provided for an annual appropriation of \$1,000,000, a sum which would doubtless be sufficient, and which at the same time is not only easily within its means, but less in proportion to revenue or population than it paid for more than thirty years after 1808, without receiving any adequate return.

Not only should the general Government aid the militia more liberally, but the individual States should increase their share of the expenses. An inefficient militia is worse than useless, and the money spent upon it is wholly wasted. If it is to be maintained at all, it should be kept to the highest state of efficiency consistent with its fundamental principle of being a voluntary, unpaid organization of men engaged in other occupations for their livelihood. It has been previously stated that some of the States contribute less than the pittance allowed by the general Government, and the nominal force in them is nearly one fourth of the whole. In these States there are no suitable armories, but few encampments, and little if any rifle-practice. The troops are not properly instructed, and would be of doubtful value in any of the emergencies for which the militia exists.

What should be and can be accomplished in the militia is to provide a force with a proper organization, uniformly armed, clothed, and equipped, well instructed in the book-drill and in the rudiments of guard and outpost duty, and, above all, perfectly familiar, by constant use, with its firearm. It is doubtful if more than this can be accomplished, and, at least in its present condition, it is probable that extended field-maneuvers and other ambitious projects which have been suggested would result in failure. It was a maxim with Colonel Emmons Clark, during the twenty-five years in which he commanded the New York 7th Regiment and brought it to its unrivaled excellence, never to attempt anything that could not be done well, and to do perfectly whatever was attempted. The result is seen in a regiment which has the maximum strength of 40 officers and 1011 men authorized by law, with over 200 instructed recruits on the "waiting list," which qualifies every year from ninety-five per cent. to ninety-seven per cent. of its strength as marksmen, whose reputation for proficiency in drill is known from one end of the land to the other, and which furnished 667 officers and men to the volunteer armies of the civil war.

The fundamental fact should always be re-

membered that the militia is a voluntary and unpaid organization of men, to whom soldiering is an incident and not the main object of their lives. Such a force must be judged by different rules and standards from those which apply to a regular army. Discipline is not impossible in such a force, but it must be maintained through the intelligence, with force only distant in the background, rather than by brute force alone. The election of regimental and company officers, which would be an absurdity in a paid regular service, is a cherished and ancient privilege of the militia, without which the force could not be maintained for a year; and it is almost equally important that the men should have the right to elect their comrades. If the guardsman is to be obtained without pay, and to give his evenings and his holidays to military work, the service must be made attractive to him by the State and Federal governments. The fact of his enlistment presupposes military enthusiasm, for there is no other sufficient motive. To keep this enthusiasm alive the State and the nation must do their part.

With these fundamental principles in view, it is not difficult to define in a general way the respective duties of the three parties to the system.

First. The Federal Government should provide arms, equipments, and equipage, all of the latest pattern furnished to the regular troops, a service undress uniform, and the system of drill; and it should have the right to an annual inspection, and to require a certain standard of efficiency as a condition of its contributions.

Second. The State should provide armories, camping-grounds, rifle-ranges, and ammunition, and the cost of transportation necessary for assembling the entire force of the State for outdoor instruction once in each year.

Third. The officers and men should give their own time without pay, purchase the distinctive full-dress uniform of their regiment or State, and pay such annual dues as are necessary for fitting up their armory rooms according to their own taste, providing such athletic sports as are useful in developing their physical condition, and paying such incidental expenses as the State cannot properly be charged with, but which are essential to maintaining a proper *esprit de corps*.

All this can be accomplished and an efficient force of about 100,000 men be maintained at a total annual expense of about fifty dollars per man, supplemented by extra appropriations for an entire rearmament whenever the progress of military science makes a change of weapons necessary. Of this expense the Federal Government may fairly be asked to contribute one fifth, the State three fifths, and the individuals one fifth. In this way will be secured the cheapest military force in the world; a force quite different from a regular army, but having a distinct and well-defined place in our military system, capable of rendering efficient and valuable service in emergencies which are more frequent than war, as well as in war itself; a force which is a constant safeguard on the side of law and order, and is competent to realize the constitutional ideal of giving "security to a free State."

Francis V. Greene.

"CEASE FIRING!"

CHARACTERISTICS.

BY S. WEIR MITCHELL, M. D., AUTHOR OF "IN WAR TIME," ETC.

VI.

It was some weeks before we were all together again. St. Clair had asked us to come to see certain clay models he had been at work upon, and thus it chanced one night that we met at his studio. This was a long building of brick, and only a story high. The rooms were separated only by heavy curtains, and the roof was broken by skylights. The place was ablaze with gas-jets as I entered the waiting-room, which was full of bas-reliefs, statuettes, and pictures—the gifts of artist friends. St. Clair was walking to and fro.

"A penny for your thoughts," I said, as I greeted him.

"They are worth more. I was thinking how Michelangelo would have enjoyed this good pipe of tobacco. As to Shakspeare, he must have smoked. I should like to know who of the poets smoked. Lamb alone has sung of it. Lowell loved a pipe: so does Tennyson; but neither ever sang its praise.

"Certainly you are wrong as to Lowell," I said. "I recall a charming passage of his about the solace of the pipe. It is an immense help to good talk, makes decent pauses, gives time to reflect, and what a resource it is when a good solidly constructed bore has you in his coils."

"You speak feelingly. When shall you write that little essay about bores we talked of?"

"Oh, who can say? When I shall have written my natural history of fools. I began it once, but was checked at the outset by the need to define a bore. It is more mysterious than it seems. We are all bores at times. I am, I know. I am acquainted with two very able and original thinkers who never talk very long, and never pay long visits, but who nevertheless indescribably bore me. I made out at last, as regards one, that it was something in the tone of his voice; and as to the other, that it was the excessive slowness of his talk."

"The man who bores one the worst," said St. Clair, "the through-and-through bore, is the man who assumes the utter absence of capacity on your part to imagine or to know what is easily imagined or known. He begins with the Ark, or the Fall of Man, when he is about to relate how he slipped on an orange-peeling."

"I know," said I. "We have a style of professional bore we call a case-doctor, who is al-

ways relating to you cases just in that fashion. As to the fool business, that is simpler. There is the foolish fool, the fool who is a good fellow, the ass fool, and the fool finely endowed with obstinacy—the mule fool, and the middle-aged woman fool. They are all first cousins of the bores."

"And which am I?" cried Vincent, as he entered with Clayborne.

"The reverse of all folly," I cried.

"I? By George! If you had my intimate acquaintance with Fred Vincent you would hardly say so."

"Envy no man," said Clayborne, "who is not sometimes a fool. The thing is to know it. Your true fool never does. Sickness, my dear Owen, must present you with some interesting varieties of the genus fool."

"Yes," I returned; "the hysterical fool is of all the worst. How about the statues, St. Clair?"

"Come in. They are only huge sketches as yet."

We followed him into the middle room, where, amid plaster legs, arms, torsos, and medallions, were three tall formless things draped in wet gray cloths. About them lay chisels, molding-tools, buckets, and troughs of damp clay.

"Do you recall," said St. Clair to me, "that a year ago you were here when I was modeling my Venus?"

"Perfectly."

"You inquired of me how the female form would look in a masculine attitude like that of the gladiator striking with the cestus. I asked Miss S——, the model, to take the attitude. I was struck with its beauty, and a month ago I made use of it, or began to. It is a Roman lady, in the days of the decadence, boxing. You know it became the strange fashion to imitate the gladiators. Look!" And at this he cast off the wet covering.

A young, nude, and beautiful woman was striking exactly as does the trained boxer. The face, somewhat large of feature, was proud, sensual, and cruel. The muscles were rather too strongly marked for beauty, but the long, sinuous curves from shoulder to foot were of marvelous vigor.

"It has its moral," said Vincent, gravely.

"Yes," returned the sculptor; "I hope so."

Then we were silent a moment, and he went on. "It had a curious effect on my model. Miss S—— is a perfectly good girl, like many of our models, and queerly full of the art sayings and criticisms of a dozen studios. She said she

did not like it, and I really think was angry, but I could get nothing more out of her."

"One might guess why she disliked it," said Vincent. "It is a terrible conception. Let us see the other. I am like your model, I hate it."

"And I may in a week," returned St. Clair, as he removed a second cloth, and looked around at us, smiling.

Four armed Greeks bore on their shoulders a shield on which lay, passive in death, the body of a young man slain in battle. The beardless face, still in the relaxation of death, rested on the edge of the shield. The features wore the expressionless calm of eternal rest from strife. I remarked on the success of the rendering of this difficult expression, or simple lack of expression, which I had seen on so many battlefields. It is not lasting, and it is not common.

"But," said Vincent, "are not men, killed with the sword, apt to show pain in the lines of the face after death?"

"Really," I said, "so few men are killed with the sword or bayonet in modern warfare that it is rather hard to answer you. For the artist this is of little moment. Men killed instantly by bullets sometimes preserve for a time precisely the expression of the moment, and no doubt you have all seen those photographs of the dead at Gettysburg, where some of them remain in exactly the postures of their last act."

"No," said Clayborne. "How strange!"

"It appears," I continued, "to be a sudden, indeed, an almost instantaneous, *rigor mortis*. Usually the dead grow rigid after some hours. Previous fatigue is said to have to do with this early and abrupt rigidity. The effect is ghastly. One of our greatest generals¹ told me that at a spring in Georgia he halted to water his horse, and called to a man kneeling with his head at the water-level to move and make way for him. As he did not stir, an aide dismounted and spoke to him. He still remained motionless, and it was then seen that while in the act of kneeling to drink a bullet had crashed through his brain, and he had stayed, as if of stone, in the attitude in which the deadly messenger of fate found him."

"I recall your having mentioned this before," said Clayborne. "You spoke then of an essay upon the subject."

"Yes; by Surgeon John H. Brinton—a most curious record."

"I once chanced," said Clayborne, "to mention it to General Grant. He said that it could not be true, as he had seen numberless battlefields, but had never noticed a single instance of a man shot retaining his posture. I replied that General Sheridan had told me he had many times seen it, and spoke of Brinton's pa-

¹ Sherman.

per. General Grant replied at once that what these two men said they had noticed must be correct, but that it was strange that he himself should never have had his attention called to what was so singular a fact."

"The singularity," I replied, "is indeed in his failure to see what must have been before him many times. He must have been lacking in the power of minute observation, or rather in that automatic capacity to note details amidst such scenes, which some possess."

"He might," said Vincent, "have been too profoundly absorbed by the greater problems with which he had to deal."

"No; it was want of the naturalist's habit of observing without effort of attention, and in part defect of interest in the unusual. He saw, but was not impressed, and so took away no remembrance of what impressed others. Certainly it was not the mere absorption in greater matters. He was almost abnormally unimpressible. Neither sudden deaths of masses of men, nor sudden reverses, disturbed his mind. I have known him to discuss breeds of horses with interest while a battle was going on."

As I talked, and after I ceased, we moved about the group for a while in silence. Then presently Vincent said, "The charm of the thing is in the bearers of the dead. It is not a calamity for them. The young hero goes home on his shield from victorious strife, dead with honor. The contrast of his set, still face with the look of triumph in their features is really a noble success in art, and there is, too, some remnant of the passion and wrath of fight still suggested in the lower facial lines of the living bearers. I congratulate you, St. Clair; it is a poem in clay. The epitaph of the dead man is in their faces."

St. Clair was delighted. "You have seized my meaning precisely," he said. "My chief trouble was in the management of the arm which hangs over the shield. It does not yet satisfy me, and to finish it in marble will be difficult."

"Had you good models?" I said. "The four men are remarkably individualized, both as to form and expression. One is much younger than the others, and his face is distinctly more sad."

"Might be a brother of the dead man," said Vincent.

"Precisely," returned St. Clair. "What charming critics you fellows are! As to models, I was fairly well off; I had two brothers of Miss S——."

"The shield is not correct as to form," said Clayborne.

"That may be true," returned the sculptor.

"Nothing seems to me more strange," I said, "than the life of a female model. And yet great ladies have been willing to be models."

"What you say," returned St. Clair, "recalls a rather singular story, which came to my knowledge in Italy years ago. Come into the outer room; it is less warm there, and we can talk at ease. The third figure is unfinished, and does not please me. It is after Browning's poem of 'Saul.' No; I won't show it, at least not to-night. Come."

We followed him into the outer room, and settled ourselves on lounges or easy-chairs, pipe in hand.

"And now for the story," said I.

"It was in Florence," he said, "years ago. The sculptor N——, at present a man of world-wide fame, was just rising into notice. He was desperately poor, proud as only an impoverished noble can be, and as handsome as one of my young Greeks. His absorption in his art was something past belief. He lived in it, and for it, and neither man nor woman seemed to attract him save in their relation to his work. I remember once, after an evening at the theater, being amused to discover that he did not know what opera had been sung, his attention having been entirely captured by the lines of the neck of a woman in a box near by.

"To cut a long story short, the young widow of an old Neapolitan prince fell madly in love with him, and, to my surprise, I learned that he was to marry her. He was rather cool about it when I congratulated him, and so the affair ran on for some months, the woman evidently much the more interested of the two.

"One night, at an open-air concert, he was talking to me excitedly of his new statue—a vestal virgin, a partly draped figure. I had seen his sketches, and anticipated a triumph of original work in its completion. Certainly the idea was novel. The vestal was asleep in her chair beside the dying altar-fire she had been set to guard. A tender smile, perhaps the dream-gift of forbidden love, was on her face—a charming conception. He told me he had had several models, but that all lacked the dignity and refinement of a Roman patrician. He foresaw failure, and wailed in an outspoken Italian way. What was the world to him? What was anything, with this fate before him, to know he might realize his vision of chastity and loveliness, and to find it eluding him? There were models in Rome, but he had no means to seek or bring them. I offered help as delicately as I could, and he resented it almost as an insult.

"Do you suppose," said he, "the Princess N—— would not help me if I asked her? I would die first! Money! I wish she had none."

"Hush!" I said; "some one will overhear you. You have so much in life—your art,

your growing fame, a noble woman, love, youth."

"And what are these?" he cried bitterly. "What is anything to me? What is youth or fame? What is she compared to my art? Do you suppose any woman's love can compensate me for what I am losing? These dreams must be born into marble or they become as wind-torn mists, and fade away. I have had this bitterness before, and love! you talk to me of love!"

"Nonsense," I said; "you cannot love as a man should love—as that woman is worthy to be loved."

"He started up.

"Love her as I love my art? Not I. The mortal before the enduring? Not I."

"He was too passionately moved to hear the quick rustle of garments behind us. But, turning my head, I saw, or thought I saw, the Princess retreating swiftly. A week later I met him radiant and joyous. As he took a seat beside me at a café, he cried:

"I have it! The clay is nearly done. Count R—— has bought it, and I am to put it into marble at once."

"And the model?" I said.

"Ah, thereby hangs a tale, as you English say. The day after I saw you the Princess left Florence. She returns next week. It is strange how she disturbs my use of the power which I know is in me. I felt free once more. You will think that horrible; it is true. Well, the day I bade her good-by I found a peasant woman waiting in my studio. She was, to my amusement, masked, and carried a little slate, like Ursula, the dumb model in Rome. On the slate was written: 'I am a model. My brothers insist that my face shall not be seen. I can come daily for a week.' I said: 'Well, here is the statue in the rough. Go back of the curtain; take this veil stuff; arrange yourself; and we will see.' Presently she came in, still masked, and took instantly the pose of my vestal. I was struck as dumb as she. An arm and shoulder are bare; the left arm, gathering the drapery, lies across the waist; the limbs are partly draped; the feet are in little sandals I had had made. Anything more gracious, more virginal, man never saw. I asked no questions, but went on as if I were inspired. No model I can recall so caught the spirit of the thing. If the ghost of some patrician girl of Rome's noblest had come to help me, it could not have been more wonderful. It was not a model; it was a vestal. The seventh day she did not appear, and that is the queerest of all, because I had agreed to pay her then, and her terms were unusually moderate. However, it is done, or nearly done; I can do without her—but—"

"But what?"

"Oh, I should have liked to have seen her again. That is all."

"And," I said, "when does Princess N—— return?"

"To-morrow. I shall be glad to see her. My mind is at ease now; and how much it will please her!"

"We met again in three days. He was wild with anger."

"She is gone!" he said. "Come and gone. Gone to Constantinople, they said, and thence to the East. Not a word, not a note. I had written to her at Naples, but had no reply. Yesterday I called, and was told she was not at home; and to-day, that she left last night."

"I said that it did seem strange to me, and that something certainly would explain it in a few days; but nothing did."

"WELL," said Clayborne, "is that all?"

"You don't mean that you don't understand it!" cried St. Clair.

"Yes. It seems to me entirely without ending."

The rest of us laughed. Clayborne, a most intelligent being, was subject at times to total eclipses.

"Perhaps," said St. Clair, "the sequel may help you. Three years later the Princess N—— married Count von C——, the German cavalry general, and a man in every way charming. Still later, at the sale of the effects of Count R——, the Princess bought my friend's vestal, outbidding an English duke and a French banker. I was told that she keeps it in her own boudoir, and that no visitors see it."

"And is that a true story?" said Vincent.

"Why ask?" cried St. Clair.

"Oh, I wanted to know if the man really did not know or ever guess who his model was. It seems incredible."

"I never asked him."

"I suppose not."

"I see now," said Clayborne, and was noisily congratulated on his acuteness amidst storms of laughter.

"Did I not once tell you," said the object of our mirth, "that at times all of us are subject to attacks of folly—idiocy, if you like. *Vide* Newton and the cats."

"Do you suppose the reverse applies to the fool?" laughed Vincent.

"Yes," I said; "in a way, up to a certain or uncertain limit. A friend of mine once made a clever enigma. It was correctly answered, and that in a moment, by a rather dull school-girl and by one of the most brilliant of American writers, but by no one else."

"Leave out the headings of a good many poems I know," said Clayborne, "and see if you have not good enigmas."

"Let us hear your enigma," said Vincent.

"Certainly," said I. "By the way, to justify Clayborne, I may as well say that it was really lines on——"

"Oh, don't tell!" cried St. Clair.

"Well, the author saw that without the heading it was a clever enigma. I believe it has not been in print."

"A simple go-between am I,
Without a thought of pride;
I part the gathered thoughts of men,
And liberally divide.
I set the soul of Shakspeare free,
To Milton's thoughts give liberty,
Bid Sidney speak with freer speech,
Let Spenser sing, and Taylor preach.
Though through all learning swift I glide,
No wisdom doth with me abide."

"What nonsense!" said Clayborne. "And the answer?"

"Don't tell!" cried St. Clair. "Let us ask Mrs. Vincent."

"Agreed," said I.

"As you like," added Clayborne; "but to go back a little. There is some element of luck in the guessing business, almost the chance falling upon the clue; and as to the reverse cases of which you spoke, there are instances of the single poem of value a man writes, the one speech of force coming from men who were before, or after, incapable. Take the stray passages in books, otherwise valueless, as the guess at the true theory of the circulation by Servetus. If my memory served me better, I could quote no end of such cases. Talking of memory, H—— told me once that he could never remember his own poems—I mean so as to repeat them accurately. That seemed odd to me."

"Not at all," said I. "He has in mind a multitude of versions, variations, and changes. It is like the want of clearness which is caused by the superposition of photographic images."

"That must be it. And, by the way, North, you promised us a sketch from the man who has the curious complaint of too good a memory. Is that alone as a case, or did you ever hear of a like instance?"

"Yes; the late C—— P—— told me he knew well a French *savant* who was troubled by the perfection of his memory. He forgot nothing. The words a passing friend said in the street, the editorial he read to-day, the lecture he heard a week or five years ago were all alike, and equally ready to turn up in mind distinct, or capable of being repeated word for word. His childish fears, emotions experienced years before, were in the same way competent to trouble him in all the acuteness of their first presence. Unlike my patient, this man, a member of the Academy, was a person of great intelligence,

and had his memorial stores somewhat under control. About my case there is an element of morbidness, and certainly only a moderate amount of mental force."

"I should think," said Clayborne, "that a curious essay could be written about the people who possessed an excess of one quality of mind without the balancing faculties which act as critical or controlling forces. I can conceive of a man with a really good intellect without imagination, or of a strong mind devoid of power to love."

"Like a cherub—a winged brain and no heart," said St. Clair.

"Delightful!" cried Vincent. "And again there is the man of imagination without critical intelligence."

"But how is it, North, as to people with excessive sensory powers? Are they apt to be as clever as others?"

"No; hardly," I replied, a little in doubt. "The cases I have seen of extraordinary sight, hearing, or smell have been in hypnotized or hysterical folks, or in people in some way diseased. I have known persons who could hear what was said in the next room; others who could detect by smell to whom garments belonged which had been laundered. Now that you raise the question, it does seem strange that our senses should sometimes in disease, or morbid conditions, attain a perfection beyond that which under any education they can reach in health."

"Your examples serve at least to show what we might be," said Clayborne. "There are some curious speculations in this direction in Taylor's 'Physical Theory of Another Life.'"

"But what about your case?" said St. Clair.

"I have it here," said I. "It is rather long, but you can smoke."

"Let me quote first," said Vincent, "the reflection of Emerson, 'A pity that the insanities of the insane are not complementary, so that we could house two of them together.' That is about his phrase. I fancy he referred to the cranks who tormented him."

"And," said St. Clair, "who have no dead point like an honest working crank."

"I must not let Vincent begin the subject of cranks," I said, "or we shall sit all night. But as Vincent quoted that suggestive thinker I was reflecting upon the fact that while we accept individuality as a thing certain for all men, and cease to wonder at its immensity of variation, we rarely remark upon the equal individualization of man's many faculties—the distinctness of quality in the different little workmen who haunt the factories of the brain. And then the wonder of it! To see these brain-cells and fibers so nearly alike that while the convolutions, the weight, and the gross

form of the low criminal brain and the brain of a Newton are, within limits, different, these tiny creative or reflective cells, these little masses of nerve-matter that think, suffer, remember, and love, and always in their own individualized way, are so much alike in the best and the worst brains that the grouped cells that made 'Hamlet' could not be distinguished by any material feature from those which gave us 'Proverbial Philosophy.'"

"Or 'Leaves of Grass,'" said Clayborne.

"Bet you anything you never read either," said St. Clair. "'Leaves of Grass' and Tupper! There was a bore."

"There are no literary bores," retorted Clayborne. "No book need bore; you can always cut a book."

"Or not *cut* it," I laughed.

"Shame!" cried Clayborne.

"Shall I help you?" said St. Clair.

"Oh, I saw it. I really did," said Clayborne.

"I am not sure," cried St. Clair, rising to fill his pipe anew. "But to end these metaphysical fancies. It does seem strange to a man dealing with the material outside human make, that while every inch of a man's skin varies so that you can swear to it as belonging to this or that man, and to no one else, the material within his skull, which at least represents him as to his highest qualities, should be to appearances so unindividual, and vary only a little as to quantity, or only a little as to gross form."

"There must be more essential variations, unseen as yet," said Vincent.

"Yes; it is we, the critics, who fail," I replied.

"As the mere materialist always will," cried Vincent. "But what does St. Clair mean by every inch of us differing?"

"I mean our surfaces. You can see it if you get a thousand men to press each his forefinger on a bit of slightly smoked card. No two will be identically the same."

"Delightful!" said Vincent. "Sounds like a bit of 'Gulliver's Travels.'"

"Oh, it is true; it has been studied, I believe, with care. What about that biography?"

"It is rather late," said I.

"Oh, go on," returned St. Clair. "We can smoke, as you said."

"No; we have talked away all the time I can now spare. Let us adjourn to Vincent's, say to Sunday night. We shall have Mrs. Vincent then, and I want her to hear it."

VII.

If there be such a thing as friendship at first sight, then it happened to me when first I saw Mrs. Vincent. I was still in bed, and at times suffering in such ways as are hideous to recall, and Fred had asked leave to bring his

young wife to see me. I was glad, for, as I have said, to be ill is a feminine verb, and agrees best with that gender. I was justified in her choice of time and a companion. She would have none of Fred, and went quietly and asked Mrs. L—— to go with her, and also she sent me word it would be at twilight, and named the hour, and was there as it struck—all of which goes to show that a goodly part of the divinity which shapes our ends materializes here below in the form of a woman.

She said no word as to my wound or my ailments, and yet, often since, I have seen her profuse in sentiment and demonstrative in manner, being a creature of many available moods. She talked pretty gossip, while Mrs. L—— sat by and wondered a little at the light folly of the chat. But when Anne Vincent left me, I was happier and more hopeful. At the door she turned, Mrs. L—— having preceded her, and said, "And now we are friends, you know." And with a smile on her lip, and with eyes quite overfull, added, "I am very exacting. Good-by."

Her goodness, her gentle follies, and the like we shall know better as these rambling pages go on.

The drawing-room was unlighted, as it was May and warm, and Mrs. Vincent, with St. Clair and Clayborne, sat at the open window, which overlooked large garden spaces.

"How silent you all are!" said I.

"That is only because we do not speak aloud," said St. Clair, with a laugh. "We are busily talking to ourselves. For my part, when I think that I came out of silence and shall return to it again, I feel what a vast balance there is against me.

"Oh, is there not enough of silence here, Of joy unspoken, of unworded cheer?"

Clayborne muttered in his great beard something about grown-up children, and then said aloud, "It is a Persian poet who says:

"Silence is the seed of thought."

"Well, then, that man had better have kept quiet a little longer!" exclaimed St. Clair. "Talk is the seed of thought."

"That is measurably true for me," returned Vincent, who had just entered. "At all events, I get cleared up as to a problem when I talk it out, and especially when I speak it out afout; I mean in court, for instance."

"But for my part," I said, "I never clear my head to my satisfaction until I write out my thinkings. I may have to do it over and over, but in no other way do I get the best out of my brain."

"And I," said Clayborne, "must sit down with a pipe, alone, and let my head work. Then it comes, if it come at all. But this follows days of looser, yet quite constant musing on the matter, and I talk slowly, as you know."

"Yes; we know," murmured St. Clair, viciously.

"Bad boy!" whispered Mrs. Vincent. "Go into a corner of silence, and stay there. Pray go on, Mr. Clayborne."

"I fancy," he continued, "that the rate of thought must govern the rate of speech. Quick thinkers are rapid speakers."

"I wonder," said St. Clair, "why it bothers a fellow to talk on his feet. I once had to speak at a dinner. I shiver at the remembrance. Where did my thoughts go, Owen? I got up with a full pocket, and in a moment was a bankrupt."

"Judging," said I, "from one's feelings the day after a public dinner, one's thoughts must go to the liver."

"That explains it," laughed Vincent. "It has always been a puzzle to me."

"Apropos of puzzles," said Mrs. Vincent, "Fred tells me you have an enigma for me, and that is curious, because I have one for you."

"Here is ours," I returned, and repeated it.

"You will never guess it," said Clayborne.

"It roosted that night in a corner of my brain, and kept me awake. At last I cursed it in good Arabic, and fell asleep."

"Stop!" said Mrs. Vincent. "It is—" And she whispered to me.

"You have it. That is correct."

"The female brain is an extraordinary instrument," said Clayborne, reflectively; while Vincent, laughing, insisted on hearing the solution.

"No," she said; "not until you have guessed mine, and perhaps not then. It is short, and pretty, and very easy; in fact, it was made for some children. Here it is:

"My first is one,
My second five,
My whole is four,
And backwards six."

"That is rather pretty," said St. Clair. "Is it—" And he whispered.

"No; that is clever, but not correct."

"An amusement for fiends," said Clayborne.

"Anything is better."

"Do you all give it up?" asked Mrs. Vincent.

"Well, the answer is—I shall never, never, tell you the answer."

"Then here is my history. I had the man's leave to use it. And now, candles, please." And so I went on.

NOTES OF A CASE OF TOO GOOD A MEMORY.

As a child I was remarked on account of absence of imagination, and for a memory of remarkable character. I learned everything with singular ease. As I grew older, I found it so possible to memorize readily that in place of using my mind in geometry or algebra, I simply read over the problems and their solutions, and got them by heart. At first this method answered all the demands of education, but when I came to apply my knowledge to examples where no solutions were given, I of course failed. Nevertheless, I was so ready with acquired knowledge that I contrived to zigzag through my school course, and then, by my father's help, obtained a place as reporter of street incidents.

And here let me pause to describe my mental condition. The full consciousness of the great mental peculiarity of which I now speak came to me only after a time, and by degrees, and more by reason of the remarks made by others than from my own unassisted observation. This struck me forcibly once when I was about to do a race; I was then eighteen years old. A man asked what was the lineage of a certain horse. I began, and without effort, or, indeed, thought, traced the parentage back to Eclipse. This excited vast amazement. Then, as afterward, I wondered at the surprise and interest my powers of memory occasioned. The results which caused surprise were purely automatic, and cost me no effort; nor have I ever been able to feel that I had to try in order to recall a fact. In a word, my memory was perfect. At first this may seem to the reader a matter of little interest; but in reality the power to forget is one of the most valuable and helpful gifts which a man possesses. When men regret the want of vivid memory, I wonder, and envy the deficiency of which they complain. I wish, indeed, that I could feel sure of the power of death as an obliterative change. As to the loss of memory, of which the aged speak, I am most anxious. I presume, from what I hear, that men lose in time the vivid recollections of sorrow, and that Methuselah at nine hundred might have reflected with little discomfort on the follies, the griefs, the crimes, of his youth. Even the keenest remorse would lose its cruel edge and be rusted dull by time. If I read a book, it is mine forever; clever or vapid, there it is. I forget nothing. I can repeat Shakspeare from end to end. As a consequence, nothing seems to me to be fresh or original. A phrase recalls one like it, and as life goes on I cease to get pleasure out of books or men's talk.

At one time I eked out my narrow income by reading manuscripts for a journal; but as

in regard to the cleverest contributions I could at once point out endless plagiarisms of thought or expression, I soon became unpopular and lost the occupation. Somewhat later I was given work to do for an encyclopedia. Seemingly there was no task for which my enormous store of varied erudition was better fitted, and yet here too I failed. My employers complained that I had no sense of proportion. All knowledge was alike to me, and all was equally well remembered. The large, the small, were as one in my mind, and had the same importance, because the place of a comma, and the words among which it lay, seemed to me equally distinct. As I reflect on this with an ever-present sense of puzzle, I seem to myself to be a mere memorial machine in which the gearing of association is altogether too complete.

My intensity of memory is accompanied with a curious automatic capacity over which I have, as life goes on, a constantly lessening control. If I remember a note, or a bar of music, I seem to hear it and a long succession of passages from the opera to which it belongs, and this is also true as to books. When awake in the dark, but also in a less degree in the daylight, I have any scene or incident which occurs to me visually projected into space before my eyes even more vividly than when I first saw it. Of late the fidelity of these recurring phantoms has troubled me, on account of their appearance seeming to be real, or what is called objective. I ascribe such apparitions to the diseased perfectness of memory, for sometimes what is past returns to me remembered in a shape even more distinct than was the impression made at the time by the then present course of the occurrence. It is singular to me that remembered sounds, which ring in my head, seem heard within it, but things once seen always appear to be outside of the head.

As I remember my dreams quite as well as the scenes of the day, I find myself troubled at times, and in doubt as to whether something is real or the product of a dream; for if a dream be as definite as a thing seen in the daylight, how shall we know it to be a thing untrue?

Certainly absolute perfection of memory is a misfortune, unless the deliberative and executive powers of the mind are normally competent to keep discipline and deal with memories which have the force of a mob.

I am told,—indeed, I know,—that, for most men, time slowly but surely blurs emotional recollections. If it were not so, all lives would be like mine—unendurable. With me the strong absolute fact of a calamity, the thing as it took place, really lives in my mind as if it had happened a moment ago, and with its recollection rises, in agonizing clearness, the emotion to which it originally gave birth. Time has no de-

structive value; all the details remain. Thus, as to my mother's death, I am forced, when associations arise, to see in all its ghastliness the minutest of the incidents of her last hours with the dreadful sharpness they had for me when, a tender child of twelve, I saw her die. Does a recurring memory merely play anew on our capacity for emotion, or do the emotions once felt remain for us as memories? I do not know. I think I must remember the emotions and not recreate them, because I am not now so sensitive to moral hurts as I once was. There is one curious trick which my sensations now and then play, and which I especially dread, and, strangely enough, it is connected with the only defect of memory to which I am ever subject. I can best illustrate this by relating an incident of my reportorial life.

Passing up an obscure street in New York, I saw a crowd around a doorway. I went, as was my business, to see what was the matter. A policeman who knew me, and who arrived at the same time, took me in with him through a window in the basement. It seemed that screams had been heard in the house, and those collected by the noise feared to enter. We went up a shabby staircase and finally found a door which was locked. As we stood near it, getting no answer to our demands to be let in, I suddenly grew faint, and a sensation of pure, causeless terror overcame me. I told my companion that I was ill, and ran down-stairs. Here I sat in a lower room, opened the window, and tried to think what it was that had thus disturbed me. The feeling that for once my memory was at fault was agreeable to me, as it always is. In a few minutes I knew that I had simply remembered a mental state without getting hold of the causative fact. Then suddenly I was aware that it was the odor of blood which had caused me to remember—I should say, to feel again—the anguish of terror I had experienced when, as a child, I saw my father bleeding from a wound of the forehead. In a few moments the policeman came down to say that a brutal murder had been done in the room we had tried to enter. This leads me to add that my sense of smell is acute.

A few days after this I was walking up the Bowery of a cold night, when I found a group around a girl who had fallen on the slippery ice and hurt herself badly. Her face, as she lay pale under a gas-lamp, at once recalled one whom I had well known. With some help I got her into a hack, and took her home to a poor little lodging where she lived with her mother. She herself was a map-colorer, and the two were evidently folks who had seen better days. The following morning I went to see them, and then began for me a period of indescribable joy in my lonely life, and yet of as utter misery.

I was, at the time I speak of, thirty-one years old. When about twenty I had been engaged (foolishly, my father said, as I had not a cent) to a girl of quite ordinary character. It ended as such affairs are apt to do, and I suffered as a lad does. Another would in process of time have come out unhurt. As for me, it led me to avoid women. Not that I disliked them; they have more charity for peculiar people than men have. But every little tenderness, a movement, a turn of the head, brought back to me intense remembrances, and all their bitter emotional accompaniments.

Throughout our simple courtship I struggled with the demon of remorseless memory. If I touched her hand, there arose the many times when I had so touched the hand of the other woman, and when at last I kissed Helen, of a sudden I felt the older joy, as it were, alongside of this new one. The ghost of extinct passion haunted the sweetness of my new and better love. So mercilessly intense was my remembrance that I became giddy for a moment. I no longer loved the other woman, and yet the recollection of my joy at winning her was brought back by a like joy in a form so real as to puzzle and confuse me.

There is no need to exemplify this trouble in detail. It recurred so often that at last I told Helen. At first she seemed only amused, but very soon became annoyed, and, absurd as it may seem, jealous of the influence my fatal memory exerted. She insisted that I could control my thoughts. I became angry at last, and we parted. Strangely enough, this rupture was a relief to me.

It seemed to me, as I read the books about memory, that every memorial impression must materially alter the brain somewhere and somehow, and that very little change should be needed to lessen what must be so slight a record. And yet, alas! for me these records seem to be unalterably persistent.

In Professor Draper's work I found his illustration of how faint need be a material record to be permanent. He says: "Put a coin on a clean mirror. Breathe on both, and wait for the moisture to evaporate; cast off the coin, put the glass aside for some days, and again breathe on the glass, and the outline of the coin will reappear." His illustration is good, but is as nothing to the delicacy of the memorial mind-marks.

I have said that I have small power to reason. I may add that I have no imagination. Memory is too implacable with me to admit of that. When I try to imagine in any of the forms described by Ruskin, I feel as though I am merely hustled by a rush of remembered facts. Every one is a poet in his sleep, but even in dreams I seldom see anything not possible, or even not clearly out of my memorial storehouse.

Facts suggest only facts for me in my effort to reason deeply, and to drive a wedge in between two facts or remembrances, and thus to separate and hold and examine them comparatively is difficult. My mind associates too rapidly for mental valuations. Thus I am forbidden by my morbid accuracy of memory to be other than minutely truthful, and the effort to make use of the little lies which cement social intercourse is rendered hard. I am not unwilling to fib, but it hurts me to be inaccurate.

After reading Dr. Horatio Wood's articles on hashish, I decided to see if this drug might not help me. I took, at first, small doses, and at last a larger one. The result I shall never forget. I had been writing, and was suddenly aware that I had lost control of my mind, and faintly realized what had happened. In place of enfeebling my memory, the drug had reinforced it. With this came also a horribly strange sensation of the flight of time. Countless ages seemed to go by as palpably as a rushing stream. Every moment seemed to be freighted with a load of memories, each mercilessly definite. I had, in fact, a sort of vertigo of reminiscences. It seemed to me that everything I had ever seen, read, or heard flashed into and through my consciousness. This ended my experiments. I am a miserable man.

WHEN I came to a close Clayborne was calmly sleeping. As I ceased, he awakened, and declared it to be very interesting.

"It is merely horrible," said Mrs. Vincent. "How welcome death must be to such a man! I can understand that he might kill himself."

"But perhaps death may also result in a vertigo of memories," I returned.

"Perhaps; yes. That indeed might give us pause."

VIII.

MRS. VINCENT, who did not love the sea, and whose dislike was reciprocated by very evil treatment on its part, was always glad to give her husband what she called a temporary divorce. She knew well how much the roughest sea voyage was his friend, and was well pleased when in summer she could persuade him to get away in his yacht.

"I have a note from Vincent," said St. Clair one day early in September. "He wants us to join him at Jamestown. Clayborne says this town is good enough. I believe he cools himself with the classic authors. At all events, go he will not."

I was happy in the chance of relief, having been detained in town all of August, and so it was that two days later we joined Vincent. We lived on his little vessel, sailed around Newport, and for a month lived a life of joyous freedom.

One day we started together to walk on Canonicut Island, across a country road which led away from the few houses on the shore. Gaining a little hilltop, we looked over at Narragansett and out to sea, or, turning, saw the Dumplings, the fort, and the quaint old steeples of Newport above the white houses scattered along the bay.

The day was perfect, and it was quiet, too, with the stillness on sea and on land of a New England Sabbath. Presently, moving on, we overtook a small, slightly built woman, who was pausing here and there to gather wild flowers.

St. Clair asked her the road to Beaver Tail Lighthouse. She said it was a rather crooked way through gates and fields, and then, as Vincent drew near, exclaimed, "Oh, what a bit of luck to see you here!"

It was evident from his greeting that they were old acquaintances. He turned and presented us. "Miss M——," he said, "and will not you show us the way? For otherwise we are but lost men."

She smiled pleasantly, and said a few words to each in turn, in a manner quite hard to put in words, but which, however one might describe it, as gracious or generous, at once established mysteriously cordial relations with the hearer. It was easy to see in a few minutes that she had the rare gift of intellectual sympathy, perhaps I should have said of sympathy in most of its forms. The farmers we met in their Sunday black suits knew her, and their dogs came and jumped on her as if welcoming a friend. The little children cast up at her shy glances of acquaintance. As we walked along, she seemed to hear all that was said, and yet with wandering eyes to see all that earth, air, and sea had to show.

We passed through fields and open gates, and at last rested on a grass-bank by the roadside. On our left was a dense shrubbery of undergrowth, ferns and scrub-oaks. The low lichen-stained walls bounded fields of perfect grass. Below us, to the left, the murmur of breaking waves came softly to the ear, and beyond, the open ocean lay intensely blue in the sun of noon.

St. Clair evidently interested our companion. He was in a mood of half-suppressed and joyous excitement, such as open air and nature at her best were apt to produce in him. "What a well-mannered day!" he said, looking around. "Such a nice reserve in its way. Here comes the wind out of the north, and says, I might be cold, but I am not; and the midday sun lets you know it might be warm, and is not. It is a day full of delicious possibilities, like—like—a nice woman."

I saw Vincent's eyebrows go up in faint

amusement, and his face said clearly, "The dear fellow is off." Not so Miss M——. "What a pretty phrase!" she exclaimed, smiling. "A well-mannered day. I shall remember that. One has worn out weather phraseology."

"Oh," said I, "the thief,

"She has the mystery of a morn in May,
Nor hot nor cold,
Nor ever grave, nor ever gay,
Until her secret soul be told."

"Ah, they always laugh at me," cried St. Clair. "And as for Dr. North's quotations, who can trust them? He is a poet in disguise, and has a half-suppressed notion that poetry is a sort of asking of the alms of emotion, and not quite as reputable work as pretending to cure folks. The day may guard her secret soul for me. The fair outside is enough. There is joy in the very air. It is a honeymoon of delight. Come, I am for the sea." And with this he rose and walked on ahead of us at a pace that soon left us far behind.

"What a glad face!" said Miss M——. "It has the most singular power of joyous expression. I remember, cousin Fred, your once speaking of him in Rome, of his intense power to feel; of his *camaraderie* with all natural objects (I think that was the word you used; it struck me as happy)."

"I am very fond of him," returned Vincent. "He is joyous by mere natural construction, a seer of things that escape us. I envy, without comprehending, his sensitiveness to innumerable impressions which escape uncaught through the coarser meshes of my mental net."

"What you say is quite true," I added; "and with it all there is a capacity for friendliness with every living thing which has often surprised me. He will quiet the fiercest dog, or take unhurt a handful of bees in his grasp. I have seen him handle a rattlesnake."

"In another man," said Vincent, "I should call his affection for trees or flowers an affection. In him it seems entirely natural. I am an observer because I have learned to observe, but this close relation to the world of animate and inanimate things is like the tie of kindred. I can merely regard it with wonder."

"Why do you call them inanimate?" said Miss M——.

"Because they are."

"We may not be animate enough to know."

"I am not," returned Vincent. "I wish I were. Something I lose, and we cannot afford to lose any of the reasonable joys of life."

"You will never miss it," said Miss M——, "really miss it—I mean this nearness of relation to nature—as you will if ever a great misfortune should pass into your life, and become thenceforward a part of you—I may say, of your every fiber."

She spoke quietly, without any tone of self-allusion in her manner; but I turned to scan her face, and saw that as she spoke her eyes were set on the distant horizon, and at once understood that she spoke of herself.

"That is true," I said. "There is strange comfort in nature when man has none to profit you. I think we all must have felt with Victor Hugo the helpfulness of finding in nature such companionship in our moods as does give a certain, if mysterious, solace."

"J'aime la roche solennelle
D'où j'entends la plainte éternelle,
Sans trêve comme le remords,
Toujours renaissant dans les ombres."

He is grieving over a debased and fallen France, and the sea is grieving with him."

"Yes," she said; "there are times when no human soul is tender enough, simple enough, or, if you like, subtle enough in its apprehensions, to be the friend we want—when man delights you not, nor woman either. It may be, it may seem to be, absurd to some, but there are days when to be alone with the sea, or solitary in the forest, consoles as nothing else can do on earth. I think," she went on, "that this mere loneliness with nature has negative as well as positive values. One escapes from talk. That alone is an immense thing—one need not make reply to the glad babble of the waters."

"And for me," said Vincent, "there would be but one remedy—work."

"No," I returned. "Few men, and fewer women, while still near to a great sorrow, can find relief in work. Few have energy enough for this. Those who have strong characteristics run risks which not the sturdiest can afford to despise. I have seen many a man under the stress of grief break down with intense business occupation."

"And yet," said Vincent, "what else is there? Let us suppose that we have used as we may all that higher consolations can offer; what shall a man do who is stricken down with the loss of something the most dear to him on earth? Work would be my remedy."

"You might be able to bear it; many are. Time would probably answer with you, and do all that is possible. I fancy the means of relief must vary with the man. It is quite sure that for many physical action is of use, and often saves the sensitive from those outward expressions of emotion which for them, at least, are full of moral and even physical danger. After a while there comes a time when systematic work is of value; but I am sure that in days of sorrow some people are best left to themselves. The blow of grief, like that of the lion's paw, deadens the sense of its own hurt, and

to urge physical exertion, work, or travel, or, in fact, anything, is vain or dangerous."

"Of course," said Vincent, "one's thoughts about these matters are chiefly of and for the nobler character. The mass of men suffer and get well without excess of sorrow."

"The thing we are after is, or ought to be," said Miss M——, "how to save the best natures from the inefficiency which sorrow sometimes brings in its train—the physical wreckage it makes."

"And, after all, is that common, North?"

"Common enough to be feared. But very often the inefficiency which it brings has other explanations. The dissolution of a partnership in life ruins or impairs the usefulness of the surviving partner. The dead gave something which was a complement essential to the usefulness of the remaining member of the firm. There are wives who supply judgment or common sense, or who in some way have the gift of energizing the husband, or of keeping him economical. She dies, and he is relatively valueless. Then people say it is grief, while very often he himself never fully comprehends what has happened to him."

"That is most true," said Vincent. "But to go back a little. Your remedy of contact with solitary nature must be only for the few, who have with it such relationship as you have been discussing. For some I am sure that travel has its value, because we are thus surrounded with distracting objects, and by people who may interest us without intruding on the solitude of ourselves. The loneliness of forest or sea would for me be madness under circumstances of such trouble as we are speaking of. Nature, not your nature, but nature in the more inclusive sense, never invented *La Trappe*."

"It gets very complex as we go on," said Miss M——. "The fact remains that for many, for the sensitive, and often for others than the intellectual, the world of natural things has soothing ways and an inexplicable comfort not elsewhere to be found."

"It may be," returned Vincent. "What are those lines of which St. Clair is so fond?"

"Only on Nature's lap can some men weep,
Only to her beloved gives she sleep;
Her sympathy alone hath ever perfect touch,
Man gives too little or he gives too much."

"Thank you," said Miss M——. "And where is your friend? We ought to be ashamed to use this perfect day for a talk so grave. Let us keep the rest of it for an east wind."

"And its consolations," laughed Vincent. "As to that I am at one with you. Its relations to me are despotic and disagreeable. Oh, there he is, the idle beggar. All Lombard street to a china orange, he has been making poetry. Halloo, St. Clair!"

Below the small lighthouse, on the rocks at the verge of the sea, the sculptor lay with his head over the edge, his face exposed to the full sunlight. The waves broke far out on a reef, and as they rose again with failing power just touched his head. He laughed with the glee of a truant boy. As we came down the rocks he sat up, shook the brine out of his hair as a dog does, looked about him, and said, "Oh, the treacherous sea! There it is."

The little black note-book he usually carried in his pocket, having been laid on a rock, had been drifted off by a wave.

"Poetry gone to sea," said I; and while we laughed heartily at his look of solemn discomfiture Vincent hooked the soaked book ashore with his cane. St. Clair ruefully spread it out in the sun, while we made numerous suggestions as to the loss to the world. St. Clair said nothing until he looked up at Miss M——'s face. Then he exclaimed, "I think you could help me."

"Yes; men have no resources," she said, and, taking the book, went quietly up the shore and into the house attached to the light-tower.

"Epic or sonnet?" said Vincent.

"Sonnet," said St. Clair, tranquilly. "What bad men you are! Don't you know that was a real misfortune? Only women are entirely good. No man was ever so good as some women. Men reason themselves into goodness, but women—oh, I hate you both! Get away, do."

There was some fun and some earnestness in his phrases. Then he sat on the rock and threw stones at the billows as if for punishment, until Miss M——, who was gone for a full half-hour, came back.

"It is all right," said she, "only a little blurred and crumpled. It will serve now to keep me in remembrance."

He made no conventional mention of thanks, but, looking up, only smiled as he put the book away. After this we sat on the rocks, saying little.

The sea was one vast round of sapphire set in the gray of the rocks and the sparkling grasses of the uplands. Out of the pine woods of the northland came stronger every hour a great wind, and as the vast billows rose on the reef with white crests, it smote them so severely that the foam streamed southward in level lines.

At last Miss M—— said: "How much of this do you carry away, Dr. North? In memory, I mean, and distinctly."

I said: "My thoughts were far afield. I can see it in a manner when I close my eyes; not as I once could, when a child."

"It is with me almost as present with my eyes shut as now," said St. Clair, "and I shall not lose it. Just as I go to sleep is the time to recall a scene I once saw, but I cannot always

keep it. It changes, or gives place to another. Is that common, North?"

"I am not sure. It is common with me; but although, like you, I can best recall a scene then, I cannot always do so. Something else appears, and then that too changes. There must be a law deducible, but as it is, with what we now know, I cannot explain the facts."

"And have you," said Miss M——, "certain habitual dreams? I have."

"Yes. I used to fancy I would collect experiences on this subject. My own are often professional. I make an error in a prescription; or, about to lecture, find in my portfolio a fairy tale."

"They would be equal in value a hundred years hence," laughed Vincent.

"Too true," I returned. "A very common dream with me is to feel that I float above the ground, always a foot or two above it. It is most agreeable."

"Oh, I do that," said Miss M——.

"Yes? And you like the sensation as you have it in your dream?"

"Certainly. But I had no idea it was a frequent delusion; for it is such with me, and a very complete delusion. Sometimes I seem to have no legs at all, and to be a spirit afloat."

"It reminds me," said Vincent, "of that queer tale of a man who lost both arms and both legs in the war. How was it the story ended, Owen?"

"He is carried to a spiritual séance, and there invited to choose what spirits he would call up. With a great deal of sense he requested his legs to reappear, and immediately was able to walk about the room. He described his gait as rather uncertain, but explained it by the fact that both legs had been for two years in the Government Museum, preserved in alcohol. The fun of it was that this absurd story was accepted by spiritualists as a new proof of the truth of their doctrine."

"Oh, not really!" exclaimed Miss M——.

"Yes. He had letters thanking him and asking for details. But, in fact, the autobiography, as a whole, deceived many, although it was written without the least desire to mystify. In one place a sum of money was collected for the poor victim."

"I think I must have read the story," remarked Miss M——.

"Just now," said Vincent, "I have in my sensitive center a waking dream to the effect that my less noble organs have been long vacant of food."

"Indeed?" said Miss M——. "Then let us go. But first, Mr. St. Clair, may I confess you?"

"Yes; surely."

"You have been making verses."

"They make themselves; sometimes in a vague, disconnected way, sometimes so as to

stay in my mind and bother me like bad children until I hear and heed."

"And have you heeded to-day? and may I hear what the children of the brain have said?"

"If it will be pleasant to you."

"It will."

Then he quietly repeated these lines:

BEAVER TAIL ROCKS.

Fare forth, my soul, fare forth and take thine
own;

The silver morning and the golden eve
Wait, as the virgins waited to receive
The bridegroom and the bride with roses strewn.
Fare forth and lift her veil, the bride is joy alone.
To thee the friendly hours with her shall bring
The changeless trust that bird and poet sing;
Her dower to-day shall be the asters sown
On breezy uplands, hers the vigor brought
Upon the north wind's wing, and hers for thee
A stately heritage of land and sea,
And all that nature hath, and all the great have
thought.

And she shall whisper, like a sea-born shell,
Things that thy love may hear, but never tell.

Vincent was silent, and I merely nodded to the poet. He understood me always.

"Is it good? Is it bad, Miss M——?" he said. "I do not know."

"It is the spirit of this joyous day for me set somehow in words," Miss M—— replied. "It likes me. I always think that such a pretty phrase. I don't quite care to discuss the verses. Send them to me, will you?"

St. Clair nodded gaily, and we rose and went our way.

Over the grass, through swaying primroses, among the bowing plumes of goldenrod and aster came the hearty north wind, as we went across the stone-walled fields and saw the quiet bay and the gray lines of the fort.

A farmer on the fence with his pipe took off his hat to Miss M——. She asked about his crops.

"There's been a heap of grass, marm, this year, and corn was never better. But this here farm of mine's the best on the island."

"And he thinks he owns it," said St. Clair, apart. "And yet the best of it to-day is yours and mine, and stem or flower of that will he never own, nor sea nor sky. I have known princes who did not own their great old galleries of pictures."

"What it is to be a poetical Marquis of Carabas!" laughed Vincent. "I am not of that famous family. Gracious, it is four o'clock!"

At the town Miss M—— left us. Then I asked Vincent who she was.

"Miss M——," he said, "is a far-away cousin of mine—very distant, in fact. A New England woman. During the war the man she

was to have married was killed at Fair Oaks. Since then her life has been one of the widest charity. Strangely enough, this slight, gentle woman with her quiet ways has a remarkable control over the criminal classes. The good she has done is past belief, and how it is that she understands and influences these ruined outcasts I cannot even dimly comprehend."

"I can," said St. Clair. "I am wicked enough to understand. I could tell that woman anything."

"And how swiftly apprehensive she is," I added; "and yet, despite her quickness, a patient hearer, and that, I think, is rare. Quick-witted folks are apt to be impatient. It needs the finest manners to keep them free from the appearance of showing that they have anticipated your explanations. They are very likely to be a trifle annoyed at overfullness of statement, just as a slightly deaf man is at your speaking too loud."

"I think," said Vincent, "it is rather the dull to whom you try to make things a little too clear who resent it as the deaf man does a loud voice. Was not your comparison rather misapplied here?"

"Perhaps so; but it is enough that you understand me."

"I should like to know that woman better," said St. Clair, "and never may. That is the worst of life."

While eating our belated lunch we ran down past Beaver Tail, and then away toward the pretty tints of Gay Head, and at last, crossing over past the beech woods of Naushon, came to anchor in the moonlight in the haven of Wood's Holl. There, on deck, in the calm of a September night (for the north wind had blown itself out), we fell by and by again into chat about the chance companion of the morning.

Lying upon long cushions on deck with our pipes, the water sparkling below us with luminous life, for a while no one spoke, until, at last, St. Clair said: "The wonder to me is how that woman took up the threads of activity and wove anew the warp and woof of life. Was the man she lost worth having?"

"He was of the best," replied Vincent. "A person of resolute character and positive convictions. He entered the army as a private, and was a colonel when he died."

"And she has made herself what we have seen and have heard to-day?"

"Yes," said Vincent; "but she has one peculiarity—at first sight an odd one. She is not very fond of children. Their needs and claims she recognizes, of course, but she prefers to help men and women. I never could understand that in one so tender."

"I think I do," I returned. "She has never again thought of marriage, and the contact with these little ones arouses, I suspect, all the sense of sadness she must have at feeling that the vast instincts of maternity can never be gratified. The sentiment is subtle, but real. Men can with difficulty understand the immense instinctiveness of the true woman nature. When her life is fulfilled in marriage and motherhood, everything tends to cultivate her instincts. In the man's life, everything tends to lessen their influence, and will with the woman, in proportion as she takes to the sterner pursuits of man."

"You are, no doubt, right," said Vincent. "It makes one think of her with renewed pity."

"And how it would all have destroyed some women," said I. "When I write my famous book on the conduct of life, I shall have to consider disaster in its relation to character."

"It gives a man," cried St. Clair, "a horrible sense of responsibility to hear you fellows talk, as if events were nothing and the man everything."

"Why, in your way," laughed Vincent, "you are the most obstinate little rascal conceivable."

"I!" said St. Clair. "I am kicked about by circumstances; I am bullied by events. Experience does me no good, and all the moral tonics disagree with me. My—what do you call it, North?—oh, my idiosyncrasy is tremendously idiosyncratic."

"Oh, stop him," cried Vincent, laughing. "Take his pipe away; do something."

"I am a happy accident. Indeed, I am a series of happy accidents. I never had a real trouble in my life. And how delicious the night is! I am for a swim, and to bed."

Nevertheless, he stood by the mast awhile, and then said, "How stupid it is without women," and then presently broke out in his clear tenor, a voice not very accurate, and of no great strength, but of passionate sweetness:

Good night! Good night! Ah, good the night
That wraps thee in its silver light.

Good night! No night is good to me
That does not bring a thought of thee—

Good night!

Good night! Be every night as sweet
As that which made our love complete;
Till that last night when death shall be
One brief good night for you and me—

Good night!

A minute later the singer went overboard into the glory of luminous gold, amidst which he swam, laughing out his joy as he smote the water into light. The next day we left Vincent and returned home together.

THE JEWS IN NEW YORK.—II.

WEDDING customs among the Hebrews in New York exhibit considerable variety. Parties to the matrimonial contract are not infrequently brought together through the agency of a paid negotiator.

Whether in an artificial or in the natural fashion the twain consent to become a dual unit in society, the services of the rabbi are called into requisition. Marriage is not only a civil but also a religious affair, and as such is celebrated with as much of pomp and display as resources may warrant.

In high life, exemplified by wealthy, cultured Sephardim, the marriage of a distinguished rabbi to a beautiful young lady will serve as a specimen of the ceremony among the orthodox. Admission to the floor of the synagogue is by card, to the galleries by favor. The reading-desk on the floor is covered by the "chuppah," or marriage baldachino. It consists of four slender posts supporting a cover of richly figured silk with massive satin fringes. On each side, except the eastern, is an arch of smilax, evergreens, and roses. Ushers are in black frock suits, and wear high silk hats. At 5 P. M. the assistant reader of the congregation chants the psalm of thanksgiving in Hebrew, to which responses are made by a trained choir in the gallery. Next, the ministers, chief among whom is the venerable father of the groom, descend from the platform and approach the door as the bridal procession enters. Returning to places within the chuppah, they are followed by the bridegroom, supporting his mother on his arm. The bride follows, accompanied by her mother, brother, and an old nurse, who, like those of her race in the West Indies, is faithful in solicitous attendance to the last. Eight little children, cousins of the bride, bearing baskets of flowers, come last.

Pure white satin is the dress of the lady, who is covered with a diaphanous veil, and carries a bouquet of flowers. Face to face with the bridegroom, she stands composedly, while the ritual is read. The first cup of consecrated wine, to be sipped by groom and bride, is then presented. If the obligations of matrimony are not

now understood by the quietly happy pair, it is not the fault of the officiating rabbi, whose long but sterling address in English is punctuated by apt Hebrew quotations. Wifely and husbandly duties are set forth with great force and precision. The officiating minister then takes a glass of wine in his hand and pronounces the seven prescribed benedictions. Bridegroom and bride taste the wine, and thus symbolize participation in the joys and pains of earthly life. The wedding-ring—plain and unadorned, as the emblem of simple contentment, perfectly rounded, as signifying concord in endless union—is placed on the bride's finger by the groom, with the words, "Behold, thou art consecrated unto me by this ring, according to the law of Moses and of Israel." Reading the "Kethubah," or marriage contract, as formulated by the fathers, is omitted, for the sufficient reason that it has already been subscribed in private. Now comes an interesting performance on the part of the newly wedded husband. The goblet from which he and his wife have drunk is deposited on the floor, and by his foot is crushed into a thousand fragments, and that with a vim that speaks eloquently of his resolve to put his foot on any and all evils that may enter the family circle until death shatters it.¹ The first kiss under the new relation is then given, the bridegroom offers his arm to his spouse, and with a proud air of responsibility leads the willing yokefellow from chuppah to entrance, and thence home to the wedding-feast.

Divorce—a rare evil among modern Israelites—in the foreign population of New York has been at times so distinguished by unlawful procedure as to call for notice by the Grand Jury. Certain Slavonic rabbis have been in the habit of granting ecclesiastical divorces to ignorant adherents, who, assuming them to be valid in civil law, have contracted second marriages. One Polish Jew in this predicament was indicted for bigamy. Rabbis are said to have performed the marriage ceremony when they knew it to be legally ineffective, and thereby exposed themselves to the charge of moral, if not of legal, criminality. What the Grand Jury recommended is legislative pro-

¹ Another interpretation of this custom of shattering a glass is that it is to be a reminder of Zion's shattered crown of glory, which even in a moment of the greatest joy may not be forgotten.

A JEWISH WEDDING.

hibition of divorce by ecclesiastics until a valid decree has been issued by a court of competent jurisdiction. The family should be under the protection of national law. To such a proposition no orthodox Jew would object, because, as the Rev. Dr. Kohut remarks, "the law of the country is Israel's law," from the Talmudic standpoint.

Whatever irregularities in respect of divorce may obtain among Slavonic Jews find explanation in the light of civil and religious history. Chastity is the corner-stone of the family institution, and the "sanctuary of morality." "The wife of thy covenant" is the "moving spirit and guardian of domestic bliss." Violation of the marriage vow gives to husband and wife alike the right to divorce. Talmudical authority extends the right in case of other offenses

or events,—some of them absurdly trivial,—and is in shame of laxity similar to not a few American States in this particular. It makes divorce legal, within the limits of civil statute, by giving a bill of divorcement known as "Get." This, if regularly issued, is granted for sufficient cause by a "Beth-Din," or ecclesiastical court, composed of a duly authorized rabbi and three assistants, who act with extreme caution and regard to precedent. It is of no avail if not in written and prescribed form, must be properly authenticated, and put into the hands of the offending person. Rabbinic law presents many obstacles to the practice. "He who divorces his wife is hated before God," "Tears are shed on God's altar for one who forsakes the love of his youth," are sentences that reveal strong repugnance to it. Get is most numerous among

the Slavonic Hebrews, who, maltreated at home, are often compelled to part from wives when emigrating thence. Such separation, though largely involuntary, is Talmudically held to warrant, in mercy to the woman, dissolution of marital bonds. Civil divorce is not binding among orthodox and conservative Jews unless sanctified by the religious ceremony. Things are not always quite so bad as they seem, and, while seldom what they ought to be, often admit the extenuation of circumstance and training. Chief Rabbi Jacob Joseph is said to have rendered excellent service by suppressing ignorant and illegal divorce practices.

Family life exemplifies many of the sweetest, strongest qualities of human nature, and is especially attractive on the Sabbath. This holy day, beginning at sunset on Friday, is kept sacred, as a memorial of creation, and in acknowledgment of God's goodness in making all things for the happiness of man, by rest from labor, and by consecration of all its hours to religious occupations. Wife and children greet the head with the salutation, "Good Sabbath" or "Shabbath." The matron, in discharge of wifely duties, lights the two long tapers in candlesticks standing on the dining-table as the blessed hours begin. Nor are they put out; except by non-Jews, as the hours advance, but are suffered to burn out. Their soft, cheerful light, radiating throughout the apartments, brightly reveals the "mezuzoth," or little hollow cylinder of lead, brass, glass, olive-wood, or silver, fastened on the right-hand door-post. Not, as with the ignorant and superstitious, is the mezuzoth here supposed to guard the dwelling against malign influences, but to remind the inmates of the obligations imposed by Deuteronomy vi. 4-9. The cylinder or case contains two passages, written upon a piece of parchment rolled up and bearing the word "Shaddai," Almighty, inscribed on the outside. Returning from the synagogue in company with the husband, and assigned to a seat at the table around which the family gathers, males covered, the "Kiddush," or sanctification of the Sabbath, is witnessed by a stranger with the interest peculiar to curiosity. The brief thanksgiving prayer ended, the house-father blesses a cup of wine, frequently made from raisins or dried grapes, and, after drinking himself, passes it round. Bread in two loaves, commemorative of the double portion of manna which fell on the sixth day, and covered with a cotton, linen, or silk napkin, is then brought forward. From these loaves slices are cut, subdivided, salted, and a portion thereof offered to each person. At the meal which follows head-gear is usually laid aside, but is resumed in time for the closing Hebrew prayer. Before the repast, every child, in order of seniority, receives

a blessing from each of the parents, and in many instances learns to look upon this token of parental love as a privilege of priceless worth. What makes the whole more impressive is the host's abstinence from nicotian indulgence. He loves it, but will not kindle any fire that is not imperatively required. Conscientious? Yes. All the meals necessary for the Sabbath are prepared on Friday. No work not absolutely needful is permitted. He has walked half a dozen miles to-day rather than encourage Sabbath desecration by using horse-car or elevated railroad.

The Sabbath closes at starlight on Saturday. *Paterfamilias* (an orthodox rabbi in the instance described) provides a wax taper composed of several strands braided on the flat, holds in his right hand a goblet of wine, and in his left a spice-box of singularly interesting workmanship, being of silver filigree, very ancient, containing aromatics, and kept in the synagogue when not used on special occasions. Wine-cup, spice-box, and taper, as a few cabalists affirm, are emblematic of water, air, and fire. The two former symbolize the Sabbath, the latter the week-day. The family stand around the table while the officiating head chants the "Habdalah," or prayer of separation, that divides the Sabbath from the secular portion of the week, and pronounces the usual benediction over the wine-cup as his wife lights the taper. Next he pronounces a blessing over the spice-box, takes an exhilarating sniff of its fragrance, and liberally vouchsafes similar privilege to every individual present, not forgetting the cooing baby. Another benediction follows, at which all raise their hands and look at the fingers in recognition of the obligation to devote all the senses to secular duty during the following week. The final benediction is now pronounced, the officiator tastes the wine, and wets his eyes with a little of it, saying, "The commandment of the Lord is pure, enlightening the eyes" (Psalm xix. 8). Then, spilling part of the remaining wine into a plate, he receives the taper from the hand of his wife, quenches it in the vinous liquid, and thus ends the ceremony.

Every male child of orthodox parents is publicly or privately circumcised on the eighth day; that is, seven complete days after its birth. The "mohel," or operator, uses modern instruments instead of the clumsily contrived implements of less scientific ages. Rosenberg and Wolff gratuitously refer the origin of the rite to Abraham's discovery that universal life-giving influence emanates from the one God, creator and preserver of all animate beings; and that it is human duty to coöperate with his actual energy in the multiplication of the species. Formal covenant between the patriarch and the Deity ensued, of which covenant circumcision is the sign. Not only is it a sign and seal of the

covenant, and a rite of great hygienic value in Oriental countries, as many eminent scientists have demonstrated to their own satisfaction, but it also possesses profound ethical significance in that it is intended to sanctify procreation, and to place the stigma of divine disapproval upon the unhallowed exercise of

In the event of sickness that may or may not be likely to end fatally, submission to the divine will, coupled with wise use of remedies, is enjoined. If the latter are of no avail, the dying one and the friends around him, or they without him, close his earthly career with that sublime declaration of divine unity: "Shema,

THE HADDALAH.

natural powers. Biblical theologians, whatever their opinions as to the date of this non-natural usage, unite in affirming its covenantal character under other relations and with purely moral ends in view. By some of the reformed Jews circumcision is regarded as anachronistic. Girls are named in the synagogue, which it is the first duty of the mother to attend after her convalescence.

"Pidyan Ha-Ben," or the redemption of the first-born, is the consecration of the boy by his mother to the service of God, and his redemption by the father, who pays the Cohen, or priest, a definite but nominal sum of money, which is subsequently devoted to religious or charitable purposes.

Circumcision in orthodox families is followed by thoroughly religious legal education, reiteratively imparted by parents to their children. Whatever else may be omitted, this, as a rule, receives conscientious attention.

Yisrael, Adonai Eloheinu Adonai Echad" (Hear, O Israel, the Lord our God is one Lord). Covering the face when the soul has departed, the attendants wash the body about an hour afterward. In the case of almost all Jews, the dissolution of alliance between the celestial elements and the material body is denoted by a lighted taper (as the symbol of immortality), a hygienic vessel of water, for ceremonial purification, and a napkin or towel. "Tahara," washing or purification, shortly precedes the funeral, and is usually performed as a privilege by volunteers. Shroud is of plain linen or cotton, coffin without ornament, and burial without ostentation, because death levels all distinctions. Therefore poor and rich are entitled to the same respect, and the embarrassment so often occasioned by costly funerals is avoided. The last look upon the remains is customarily accompanied by a slight rent in the breast of the mourner's garment, to express

grief. When the coffin is deposited in the grave, the bystanders ejaculate, "May he [or she] repose in peace." Near relatives and friends, in succession, throw earth into the excavation, repeat the ninety-first Psalm, and then return to their homes. Among the reformed Jews, and with many of the orthodox, the funeral concomitants are of similar style and costliness to those of Christians.

Wailing for the dead in a purely orthodox Jewish "house of mourning" is inexpressibly sad, and clamorously voices a sorrow which, like that of Rachel, refuses to be comforted. "Shiva," or the seven days of mourning, begins when the domicile is reached. During this period, unless unavoidable necessity compel, the bereaved do not quit the dwelling,

of divine sovereignty, and an avowal of resignation to the All-Perfect Will. "Yahrzeit" (year's time) is the anniversary of the parent's death. On the evening preceding, a light is kindled in the house, and kept burning until the following sundown. Synagogue service in the morning and evening is also attended, and the kaddish recited. "Nahala" (inheritance) is the poetic equivalent of the Spanish and Portuguese Jews for the Teutonic Yahrzeit.

Jewish law requires separate cemeteries, but is not invariably obeyed. The first Hebrew purchase of ground in New York for God's-acre was, it is said, at the corner of Gold and Jacob streets. The second was made in 1681, and consisted of a plot of which a part may

CONSERVATORY OF THE
MONTEFIORE HOME.

or attend to any ordinary vocation. Minyan assembles morning and evening, and prayer is offered for the repose of the deceased. Friends pay visits of condolence, and deeds of beneficence afford some relief to anguish. Including the Shiva, and following it, is a general mourning of thirty days,—of twelve months for a parent,—in which is total abstinence from festivity or pleasure. Throughout the year of mourning for a parent the bereaved of both sexes attend every service of the synagogue, and recite aloud the kaddish. Standing in sable garments while others sit, they repeat what is not a prayer for the dead, but a eulogy

yet be seen at what is now Oliver street and the Bowery, in the very heart of the busiest district. Burials are chiefly in Cypress Hills, Bayside, Machpelah, Washington, and Mount Nebo cemeteries on Long Island. In each of these is a section exclusively appropriated to Hebrews, and in this section are plots owned by chevras, lodges, and private families. Charity supplied 550 resting-places to coreligionists for the slumber of their dead in 1890, thus sparing them from the shame of begging, perchance in vain, for a few square feet of soil in which the loved might lie, and the dead from the disgrace of promiscuous sepulture in the Potter's Field.

German originality is credited with the dictum that "men are what they feed upon"—"Der Mensch ist was er isst" (Feuerbach);

that in physique, mind, and morals they are modified by means of subsistence. If eaters of "flesh, with its soul, its blood," or its "life" (Leviticus xvii. 14), they acquire somewhat of the characteristics of the animals devoured. For this reason it is conjectured that blood is prohibited by Genesis ix. 4, Deuteronomy xii. 16, and unclean beasts by the Mosaic code. Impurity of body is believed to engender impurity of spirit. Dietary rules are directed to the development of normal life in body and spirit.

Whatever may be the menu of poorer Jews in this and other lands, it is certain that the utmost care is taken to provide clean, lawful, or wholesome and nutritious flesh for all who can afford to pay for it in New York. One of the largest abattoirs in the city, covering an ample block, owned and operated by men of Jewish race and faith, is remarkable for its smooth and effective working and admirable distribution of parts. An average of eight hundred cattle, between three and five years old, pass through it in each of the business days of the year. Arriving from the West at the river-front, they ascend one by one to the fateful inclosure, where an adept employee fastens a chain around the hind leg of each. Hoisted by machinery, the bovine falls gently upon one shoulder, and in most instances without a cry. Occasionally, however, some brute, maddened by sight and smell of blood, breaks out into the slaughter-house, and creates disturbance that is speedily quelled by its own despatch. Submissive companions, with neck twisted to expose the throat, quickly feel the shochet's long and shining knife. The shochet himself is a stalwart fellow, cool and wary withal, who rarely makes a useless motion. He is a religious man and of good moral character, as his license from Rabbi Jacob Joseph, chief of certain orthodox congregations in the metropolis, avouches. The lifestream in torrents follows the movement of his blade. This is "shechita," the killing. It insures complete effusion of blood, in which may be germs of disease that otherwise might find entrance into human bodies. Next follows "bediqah," the examination of instrument and victim. If a nick appear on the keen edge of the knife, that by extremists is held to imply unnecessary suffering, injurious chemical change, and consequent unfitness of the carcass for market. If there be none, lungs, liver, and heart, the entire body indeed, are minutely inspected. Organic lesion, purulent deposit, inflammation, or bone fracture, is at once detected, and condemns the whole as "trepha," or unclean, and inedible by the faithful. But necessity knows no law. The impecunious faithful in vociferous pursuit of garbage-cart, or reclaiming offen-

IN A JEWISH SLAUGHTER-HOUSE — EXAMINING THE KNIFE.

sive meat from malodorous dump, until the drenching with sludge acid made it abhorrent even to the stomach of a jackal, have been too familiar to the eyes of sanitary officials. Even now, in the locality mockingly styled the "Pig-market," seemingly for the reason that pork is never sold there, deliquescent peaches at a cent per quart, eggs in various stages of antiquity, frowzy chickens, and dumbly protesting geese in halves, quarters, and eighths, cuts of beef and mutton at prices whereof the avenues never dreamed, condiments and sweetmeats foreign to all other civic quarters, poison while they prolong existence that would otherwise end through sheer inanition.

A tag affixed to each half of a beef in the abattoir is proof of its gastronomic value. Christians, as well as Jews, attach great importance to this silent token, and therefore non-Jewish purveyors are often wont to employ shochetim, or the shochetic methods.

Not less care is exemplified in killing other quadrupeds and fowls. Ultraists adhere to antique regulations, held by the best Jewish authorities to be binding only under conditions in respect of which they were made. Yet very

many are the Israelites who now deny themselves the privilege of cooking on winter Sabbaths, of masticating sirloin, rump, or porterhouse steak, because inhibited by law, and of enjoying oysters, lobsters, or shrimps because forbidden by Leviticus xi. 10.

That the sumptuary regulations of the rabbinical code tend to healthfulness and longevity, as well as to separation from other races and religions, is less clear than is generally imagined. The "United States Census Bulletin, No. 19," on the "Vital Statistics of the Jews in the United States," covers a period of five years in the experience of 10,618 Jewish families, of whom 3996 kept no servant, and 6622 kept one or more, out of a total of 15,000, and including 60,630 persons scattered all over the country. These answered scheduled inquiries, distributed by special agent A. S. Salomons, which sought to ascertain the rate of marriages, births, and deaths per thousand of the Jewish race. Some curious facts were elicited, and among them that in 1880 the proportion of Jewish males to females was 109.53 to 100 as against 103.57 males to 100 females of the general population; that the annual marriage-rate is only 7.4 per 1000, while the average rate is 18 to 22 per 1000 in the North-eastern States; that the average number of children to Jewish mothers of American birth is 3.56, of German 5.24, of Russian and Polish 5.63, Hungarian 5.27, and Bohemian 5.44; that 103.16 males are born to every 100 females in these families, and that the average birth-rate is 20.81 per 1000, which is lower than that of the Aryan or African population.

Of 18,115 males whose business is reported, 14,527 were traders, bankers, bookkeepers, clerks, etc., 84 laborers, and 383 agriculturists. The annual death-rate for the five years was 7.11 per 1000, or little more than half that of other people of similar social class and condition of living in this country. The average expectation of life is considerably higher. Loss by death from diphtheria, diarrhea, diseases of the nervous system, and especially of the spinal cord, diseases of the circulatory and urinary systems, bones, joints, and skin, has been greater than that of non-Jewish neighbors; while mortality from tubercular diseases, including consumption, scrofula, tabes, and hydrocephalus, has been less than that of other peoples with whom they have been compared. Of the 60,630 persons in these Jewish families living on December 31, 1889, 617 were reported as sick, and 202 — including the insane, blind, deaf, maimed, and crippled — as in some way personally defective. The proportion of Jews affected by disease was 10.17 per 1000, while of the population of Massachusetts in 1885 it was 7.47. For Jews over 15 years of

age it was 14.22 per 1000; for the United States in 1880 it was 12.75 per 1000. Extended and trustworthy statistics of births and deaths in all sections of the city of New York, and indeed of the country, are indispensable to determine with anything like accuracy the relative health and longevity of our Jewish fellow citizens. The general conclusion is that while the marriage-, birth-, and death-rates are less than those of their neighbors, the birth-rate is decreasing and the death-rate increasing with prolonged residence in this country.

No people are more keenly alive to the advantages of thoroughly available education than the Jews. Biblical and Talmudical writers emphasize its value. The destruction of Jerusalem is by some of the latter referred to the neglect of youthful instruction. There are fewer truant children among the Hebrews, relatively to their number, than among other racial constituents of the metropolitan body. In the primary and in the grammar schools, in the New York Female College and in the College of the City of New York, the proportion of Jewish students is remarkably large, and their comparative scholarship no less noticeable. In mental arithmetic they take the lead. Aptitude for pecuniary calculation is organized and hereditary.

While antagonism between pupils of different race and faith will almost inevitably spring up, there seems to be as little of it between Jews and Christians as between Protestants and Roman Catholics. Nay, less — owing to the similarity of ethical culture. In private schools the repugnance is more manifest, and is on the part of parents rather than of children. Jewish parents do not object to coeducation of their progeny with that of non-Jews. Many professed Christians oppose it. An able and experienced woman teacher, author of an esteemed volume on the education of girls, and the proprietor of a private school, suffered reduction in the number of her pupils, among whom was the daughter of a cosmopolitan Christian editor, from 110 to 60 or 70, because she admitted Jewesses. Where reasons for the withdrawal of patronage were assigned, it was evident that the caste spirit, as well as alleged objectionable peculiarities in the Semitic damsels, did much to formulate them. Private Hebrew seminaries are not open to the same objection, perhaps because admission into even the best of them is not generally desired. No American boy or girl, whatever the ancestral extraction, would wish to become a pupil in any of the private Jewish schools so numerous in tenements and synagogues east of the Bowery. Unclean, overcrowded, saturated with the fumes of cooking food and burning tobacco, and sometimes perilous from the prox-

imity of contagious disease, they are further distinguished by laxity of discipline, inability of the Russian or Polish pedagogue to speak English, and the harsh gutturalism of his Hebrew or Jüdisch-Deutsch.

Religious tuition at Israelitish expense is imparted to children in the establishments of the Hebrew Free School Association at No. 624 Fifth street, 206 East Broadway, and 244 East Fifty-second street. School sessions are from 4 P. M. to 6 P. M. on secular days, and from 9 A. M. to 12 M. on Sabbaths. At the second of these institutions 749 girls and 376 boys were in attendance on February 1, 1891. Each sex is divided into five grades, of which the instruction is religious. That of the highest includes prayers, Bible, and catechism. Recitations of Hebrew in concert, followed by excellent English translation, are verbally perfect, and deeply imprint lessons on the memory. The pupils are all from the public schools. So are many of the teachers. Inspired by earnest purpose, and enthusiastic withal, the whole seem happy in their work. Teaching and reading are phonetic. Names of letters, vowel-points, and other signs are committed to memory as the scholar advances.

In the kindergarten is a reproduction of fairy-land, with tokens of bad air, hard fare, and rough experience upon the fairies. All are forgotten, however, in the excitement of rhythmical motion, song, and juvenile histrionics. The "Snow-storm" is a favorite performance, all the more acceptable because a sheet of filmy gauze does duty for descending snowflakes.

In the schools the girls are taught sewing, dressmaking, embroidery, and other feminine arts. Some boys in the industrial school promise great proficiency in wood-working. Both sexes would do better if complaints of vitiated air and defective ventilation had not such frequent and firm foundation in fact.

The Louis Down-Town Sabbath and Daily School, 267 Henry street, a specimen of several kindred institutions, is on Sabbaths attended by over three hundred Jewish girls, mainly of Slavonic parentage, whose recitations in English, of decalogue, prayers, and hymns, are wonderfully fluent and fitting. Charity here is practical and judicious. The hungry are regaled on bread and milk, the needy covered with shoes and clothing. Employment is found for graduates prepared therefor by training in the

STUDYING THE TORAH.

technical branches of millinery, designing, and the ordinary branches of an English education. Nor is this the only industrial school under Hebrew management in the city. In all of them religion of the Judaic type plays a prominent part.

Talmudic study of the Torah is the specialty of several schools; also of Hebrew Talmudical Literary Associations, composed principally of young men. The "Machzikay Talmud Torah" (Supporter of the Study of the Law) Academy, at No. 227 East Broadway, is the embodiment of traditionalism striving to perpetuate itself through future generations. About fourteen hundred lads, mainly of Slavonic antecedents, nearly all poverty-stricken, and dependent upon Hebrew beneficence for clothing, are there conducted by twelve teachers through four years' study of the Old Testament as viewed from Talmudic standpoints. The history, philosophy, theology, and ceremonials of the Jewish Church are also included in the curriculum. Mosaic legislation receives minute attention. Fifty boys were in the ninth, and forty-eight in the alphabetic, class, differing numbers making up the intermediate classes, in May, 1890. Reading and writing in square and rabbinical characters

are taught. The school is in the ninth year of its progress. Promising pupils may pass thence to the public schools, College of the City of New York, or Hebrew theological seminaries, where they are finally qualified to assume the duties of the rabbinate.

Familiarity on the part of the Jews with the letter and spirit of the Old Testament, as rabbinically expounded, is truly marvelous. Not a few of the orthodox Jews can repeat the contents of the sacred books without omitting a word. Were every copy thereof destroyed, the Jews in New York do not vainly affirm that they could produce several perfect copies, from memory alone, within the space of twenty-four hours. Accurate memorizing of the Talmud is well-nigh as wonderful. Forty Russians and Poles, it is said, might be selected who could repeat the whole.

Whether the results of such diligent application be sufficiently valuable to compensate for the time and energy expended in acquiring them is almost exclusively a Jewish question. Devotees think they are. The subject of study is unquestionably ancient. The Midrash on "Shir ha Shirim Rabba," the Song of Solomon, and elsewhere in Oriental hyperbole declares that the Torah "had really existed two thousand years before creation; the patriarchs had their academies of study, and they had known and observed all the ordinances; and traditionalism had the same origin, both as to time and authority, as the Law itself." This is certainly an impressive way of teaching that inasmuch as the object of creation is to make earth the abode of human happiness, the Law, as an indispensable guide thereto, must always have been in existence. Jewish orthodoxy believes the oral to be equal to the written law in weight of authority—nay, indeed, to be superior, as voicing the concurrent opinions of accepted expositors. It guards the sanctity of the written law by extending and adding to its provisions—drawing a "geder," or hedge, around its "garden inclosed." "An offense against the sayings [enactments] of the scribes is worse than one against those of Scripture."

"Moses," declares the Pirké Aboth, "received the law from Sinai, and delivered it to Joshua, and Joshua to the elders, and the elders to the prophets, and the prophets to the Men of the Great Synagogue." Compiled by Jehuda Hanassi in the second century of the Christian era, and denominated the "Mishna," or Second Law, it gave rise to erudite commentators whose expositions are styled the "Gemara." Mishna and Gemara constitute the Talmud, but some writers restrict the term to

the Gemara alone. Of the Talmud there are two editions: that of Jerusalem, edited by Rabbi Jochanan A. D. 370, and that of Babylon, edited by Rabina and Rab Asa in 375-427. The exegete of either or both is the Talmid.

Divided into six "sedarim," orders; 62 or 63 tractates ("massekhtoth," textures, webs); 525 "peraqim," chapters; and 4187 "mishnayoth," verses, containing the "Halakhah," or traditional regulations by which the fathers walked and which the children are obliged to observe, "they," Edersheim remarks, "provided for every possible and impossible case, entered into every detail of private, family, and public life, and with iron logic, unbending rigor, and most minute analysis, pursued and dominated man, turn whither he might, laying on him a yoke which was truly unbearable,"—a yoke, however, which the Jews declare is now and always has been borne gladly and uncomplainingly by millions of coreligionists,—and promising him knowledge, righteousness, and reward in return for obedience. Which foot to put out of bed first, how to wash a pocket-handkerchief, and how to compound medicines that remind the reader of the witches' hell-broth, are matters by no means too trivial for the Talmud. "If," says Edersheim, "we imagine something containing law reports, a rabbinical 'Hansard,' and notes of a theological debating-club,—all thoroughly Oriental, full of discussions, anecdotes, quaint sayings, fancies, legends, and too often of what from its profanity, superstition, and even obscenity, could scarcely be quoted,—we may form some general idea of what the Talmud is." "One half of the Talmud ought never to have been written," is the dictum of an erudite and cultivated rabbi in New York. In the estimation of another it sustains a relation to Judaism similar to that of the daily press to Christianity. Neither is a trustworthy exponent.

The Jerusalem Talmud extends over 39, the Babylonian over 36½, of the 63 Mishnic tractates, of which 15½ have no Gemara, or Comment, at all. The Babylonian Talmud is four times larger than the Jerusalem, and ten or eleven times larger than the Mishna. The first is written in the eastern, the second in the western, dialect of the Aramean language. Both discuss the Mishna clause by clause. Beautiful and sublime passages, "brilliant diamonds in heaps of cinders," sparkle on their pages.

The "Torah," Law, contained in the Pentateuch, is the corner-stone of Judaism. "Kabbalah" (that which has been received) comprises the teachings of the prophets, the Hagiographa, and the oral traditions.¹ "Ha-

¹ The teachings of the prophets and the Hagiographa are sometimes referred to by the rabbis under the same designation as that applied to the traditions. Pirké

(chapters) Aboth contains the characteristic ethical "Sayings of the Fathers," known as the "Tannaim," or doctors of the Mishna, which are wholly Haggadic.

UNITED HEBREW CHARITIES—WAITING THEIR TURN.

lakhah" (that which has been heard—that is, delivered as law) is legally obligatory; "Haggadah" (that which was said) owes its force to individual authority, and not to legal ordinance. The latter is illustration, commentary, anecdote, clever or learned saying, etc. Midrash is the sacred study of Halakhah and Haggadah, and also the utterance of the student upon any portion of his subject. The edifice in which this study is pursued bears the title of Beth Hammidrash. Boraitas are traditions external to the Mishna, Tosephtoth are additions to it.

Critics differ widely as to the value of the Talmud. The main body of Jewish theology and ethics is only Haggadic, and therefore not of absolute authority. The Halakhah is painfully punctilious about outward observances, but leaves the "inner man, the spring of actions, untouched." What is to be believed and experienced is chiefly matter of Haggadah. Israel, as a whole, has often made void the law through his traditions—has crushed the life of religion by imposing an enormous burden of rites and ceremonies. Yet his prophets were not legalists, nor are many of his teachers to-day. There are numbers of "just and devout" men among his descendants, who wait "for the consolation of Israel" (Luke ii. 25), and upon whom the Holy Spirit abides.

Study of what is essential in the Torah as the law of humanity has, under God, glorified martyrs like Rabbi Akiba, inspired all that is vital in Islam, and clothed the Karaite Jews with pure morality. Talmudic study of the Torah has ever been one of the firmest bonds of Jewish Church and nationality. Wherever it has failed to lay hold on the spirit, and stubbornly restricted itself to the letter, it has created bigots and fanatics. That "the Torah will never be exchanged for another" may be wholly true; but Christians hold it to be none the less certain that its religious and ethical teachings have been supplemented and perfected by those of the New Testament. Despite the closest addiction to the Talmud, Judaism is modified by, while to some extent modifying, Christianity. It begins to claim inheritance in Jesus of Nazareth, the grandest scion of the Abrahamic stock; it rejoices to number professors of the Christianity of Christ among its true though dissenting friends; it recognizes Christianity as the "daughter religion," and its basis to be the commandment, "Love thy neighbor as thyself" (Leviticus xix. 18). It no longer hesitates, through reformed rabbis like the Rev. Dr. K. Kohler, "to recognize in Jesus of Nazareth and his apostles the greatest harbingers of light for the heathen world. We readily acknowledge him to have been one of the world's sweetest preachers, one of Israel's loftiest pro-

phets, one of the great redeemers of the lost and forsaken of the race, one of the noblest teachers of morals that ever lived"—and yet "but a Jew, after the model of Hillel or Philo." Others of orthodox sentiment class the "Man of Nazareth" with Socrates, Zoroaster, Gautama, Confucius, and Mohammed, chosen instruments to lead humanity from idolatry to the one true God. The Christianity of to-day, they contend, is not what Jesus taught and practised. Until it shall return to the original type, which they say included the observance of all Mosaic law, their attitude of obstinate refusal to become Christians, "or even to approach the younger faith," will remain unchanged. Intelligent Judaism declares that the cause of atrocious persecutions endured by its adherents "was by no means the teachings of Christianity, which recommends love to every one, but the ignorance, coarseness, and animal passions of fanatic priests and mobs."

The animus of this deliverance will help to separate the precious from the vile in Jewish literature, and add it to the common stock of religion and ethics. The "Jewish Home Prayer-book," issued by the Jewish Ministers' Association of America, thankfully points to the design of the Almighty, "that all classes and all ages might learn that the Torah is for them in common," and that the first recipients of it were appointed to be "its interpreters unto all mankind."

Sunday-schools have been organized by many Jewish congregations in New York. Neither thought, pains, nor labor is spared to make them efficient agents of Judaism, orthodox and reformed. Pedagogical instruction by about a dozen paid agents, whose normal qualifications are ascertained by strict examination, is distinctive of that in the Temple Emanu-El. The accomplished chief rabbi is deeply interested in its prosperity, and does not hesitate to invite any friendly Christian minister to address it. In common with enlightened philosophers of all faiths, the thinkers in this synagogue believe that the gathering of Jews from all lands into the city, and their subsequent education under conditions of perfect equality before the law, portend some great development of divine providence, and more rapid upbuilding of the kingdom of God.

To the latter the Jewish Theological Seminary, now humbly domiciled at the Cooper Union, is enthusiastically consecrated. Formally opened on January 2, 1887, by representatives of conservative congregations, it is differentiated from the Hebrew Union College at Cincinnati, which has graduated many liberal reformed rabbis since its organization in 1875, by concord with the consensus of historical Jewish beliefs, based on the Bible and expounded by Israelitish sages. Mishna and

AN URGENT APPEAL.

ENGRAVED BY C. STACE.

Gemara, Midrashim and Schulchan Aruch, find conspicuous position in present teaching. Five professorships, whose functions for the most part have hitherto been ably exercised by the Rev. Drs. S. Morais, G. Lieberman, B. Drachman, and A. Kohut, are projected. Most of the students, numbering over thirty, are poor, and of Slavonic birth or ancestry. Character and culture, orthodox faith, desire to perpetuate "true Judaism as a system of right living, based upon the revealed will of God," acquaintance with the Hebrew language and learning, and ordination, are, in this institution, prerequisites for the rabbinate.

Just as solicitously are the 145 youths, more or less, daily convening in the Hebrew Technical Institute, Nos. 34, 36 Stuyvesant Place, trained for industrial usefulness. The most impressive feature of this institution, as seen on a casual visit in the winter of 1890-91, was the class of eight or nine boys in working costume, perched at ease on work-benches, and eagerly absorbing a lecture on electricity from a spectacled young man whose person bore the tokens of ancestral want and hardship, but whose speech was pointed, concise, and instructive. It may in part be due to his exertions that the alumni have established an organization known as the Franklin Electric Society. Nearly all the instruments in use, such as dynamos, tangent galvanometer, etc., were constructed by the pupils.

To Dr. Henry M. Leipziger, Assistant Superintendent of Public Schools in the city of New York, and an able corps of assistants, great credit is due for the admirable exhibit of school work at the Hebrew Educational Fair in 1889. The booth was built by their pupils, and its walls were decorated with carvings and

drawings by their hands. Tables were covered with specimens of their skill in wood and iron. At the lathes, constructed from patterns which they themselves had made, deft artisans turned formless lumber into geometrical shapes; and at the benches nimble mechanics used hammer, saw, and chisel. All had been taught the scientific principles pertaining to their practice. At present it is thought that fully one hundred graduates from the Hebrew Technical Institute are at work in various mechanical workshops. Demand for their services, because of excellent training and habits, is steady. Endowment for the school is asked of its patrons, and would increase its utility. Receipts for the calendar year 1890 amounted to \$13,125.99, and expenditures to \$16,645.38.

The Hebrew Free School Association, Aguilar Free Library Society, and Young Men's Hebrew Association, together constituting the Hebrew Educational Alliance, will soon be installed in the handsome and serviceable edifice known as the Hebrew Institute, on Jefferson street and East Broadway, by which all the requirements of sanitary science are satisfied. Ample room for select and general assemblies is provided. Library and reading-room, gymnasium, workshops, cooking-school, baths, etc., are also instruments of individual and social improvement. Hither the industrial education carried on at No. 58 St. Mark's Place is to be transferred—an education by which more than two hundred girls are taught the mysteries of sewing, dress-cutting, fitting, and drafting according to the Taylor system. Their embroidery is of such excellence that it has repeatedly captured prizes offered by the Society of Decorative Art.

What is true of the private and communal schools may also be predicated of those connected with the eleemosynary institutions of the Jews in New York. That of the Hebrew Benevolent and Orphan Asylum Society—which also extends the scope of its beneficence so as to embrace charity and relief, the Hebrew Technical Institute, education, orphans' estates, life insurance, and bequests—is a distinguished example. The Orphan Asylum, located on One Hundred and Thirty-eighth street and Tenth Avenue, domiciles over 550 full or half orphans, principally boys, between the ages of four and fourteen years. Rudimentary manual training is part of their education. The drawing-classes do enviable work. Instruction is thorough. Sanitation, notwithstanding 110 boys in one

IN THE ELECTRICAL ROOM OF THE TECHNICAL INSTITUTE.

CAFÉ OF THE PROGRESS CLUB.

dormitory, is admirable. The hospital, with relatively few patients, is isolated. The synagogue, large, neat, inviting, is accessible to all. One cannot but admire the genius of ritualistic churches for acquiring valuable and beautiful possessions. This property is in fee simple, runs down to the North River, and has, for the delectation of those who delight in magnificent scenes of land or water, a spacious dining-room that commands the finest views of any refectory in the city. Boys enter in military order. Soldierly style is the product of five drills every week and an exhibition drill on Sunday. In the civic and industrial parade of May 1, 1889, the Orphan Asylum was represented by a battalion of six companies, composed of 300 lads under thirteen years of age, headed by a band and a drum and fife corps. On the ensuing Thanksgiving Day they proudly received from the hand of General William T. Sherman a beautiful banner, in recognition of their high military bearing and regular marching.

Oratory of no mean order was also illustrated by the boys who were chosen speakers on that occasion. The Rev. Dr. H. Baar, Rabbi of the Asylum, has been its superintendent for more than sixteen years. His brief, pithy, and telling lectures are such as "strike and stick," and exert permanent influence.

Published works perpetuate his religious and ethical teachings. Immensely popular with his juvenile flock, who magnify anniversaries of his birth by presentation of cards, flowers, etc., he includes the amenities of life in the educational program, so that the bright, happy fellows are often unwilling to leave the only home they have ever known.

Professor Ehrlich, collaborator of Dr. Delitzsch in the translation of the New Testament into Hebrew, is an able and learned assistant. Nine boys, between the ages of eleven and fourteen, are members of his Talmud-Torah class, and study Aramaic selections from the Mishna and the prophet Daniel. These are intended to become teachers. The spirit of the institution may be inferred from the aspiration of one of its brightest pupils: "I hope we shall all be one some day." Reformed Judaism is most prominent in the management, and drew from the late Miss Sarah A. Burr the munificent legacy of \$50,000, commemorated by a mural tablet to her memory.

The support of the institution, with its excellent corps of skilled instructors, is from subscription, bequest, and the city treasury; and is at an annual cost of about \$108,500, including the \$25,000 contributed to the United Hebrew Charities.

TEMPLE BETH-EL, FROM CENTRAL PARK.

Jewish women are quite as zealous for the preservation of the ancestral faith as men, and, as members of the Hebrew Sheltering Guardian Society,—whose Orphan Asylum, in near proximity to the one just described, has domiciled 1646 children committed to their care by judicial officers,—are remarkable for sterling business sense and productiveness of deliberate action. Five hundred and sixty-six wards were under their supervision at the close of the fiscal year in 1890. The two hundred girls, more or less, in their branch institution on Avenue A, Eighty-seventh street, will shortly find residence in the building erected for their accommodation, at a cost of \$100,000, close to that already in use on Washington Heights, and formerly known as the “Home and School for Children of Union Soldiers and Sailors.” Hungary and Russia furnish a large number of inmates to both establishments. The boys, and many of the girls, as is the case with the beneficiaries in the Hebrew Orphan Asylum, are sent to the public schools, where they obtain an average of ninety-five per cent. in favorable marks. Some

have passed the examination needful to enter the College of the City of New York. But the object of patrons is to qualify them for earning subsistence by trades and other occupations, and to that end special instruction in the Jewish religion and in the rudiments of the Hebrew and German languages is bestowed. About fifty boys are organized as a uniformed fife and drum corps, greatly to their own amusement and the favor of the public. Orthodox Jews, like the late Philip J. Joachimsen, the founder, sustain the enterprise without aid from the State treasury, but with \$65,374 in 1890 from the excise moneys. The annual expenditure is from \$60,000 to \$70,000. All religious aspects are in strict conformity with Jewish laws and usages. Servants are chiefly Slavs and Christians. Equal liberality is evinced in the employment of physicians. Diet, dress, dormitories, school-rooms, and playgrounds are all adapted to the needs of children whose prevalent diseases are of the eye, scalp, and stomach, and whose past privations have often left indelible evidences on generally healthy bodies. The “Golden

Book of Life," in this as in all eleemosynary receptacles, awaits increase of donors' names, and transmits the record of benevolence.

None of the older world-religions surpasses Judaism in the merciful provision made by law for the relief of the poor. One of its proudest boasts is that there are so few Jewish beggars in the streets and paupers in the almshouses. Its living exponents are not infrequently generous subscribers to the charities of other faiths. A forlorn, disabled soldier of Pentateuchal creed, dying in a hospital before the funds collected for his benefit could be applied, occasioned the first systematic arrangement of Jewish mercy in New York—mercy whose resources are now exhaustively taxed by tens of thousands of poor, perishing expatriated ones cast upon them by northern and eastern Europe. Christian philanthropists, such as the late Daniel B. Fayerweather, are not slow to discern the divine spirit of revealed religion when they reciprocate Hebrew liberality by their own munificence to Hebrew charities.

The mind, heart, and hand of revealed religion are excellently manifest in the Montefiore Home for Chronic Invalids, on the Grand Boulevard, One Hundred and Thirty-eighth and One Hundred and Thirty-ninth streets. This is an esthetic architectural adornment to the city, and most welcome refuge to sufferers from any disease that is not contagious, epileptic, insane, or leprous. Built in the hundredth year of Sir Moses Montefiore, in honor of his noble character and universal philanthropy, it is supplied with the best hygienic and surgical appliances, and yields the palm to no establishment in respect of wise adaptation to desiderated ends. Here mercy is exquisitely thoughtful and tender. A sewing-room for convalescent women, and a chess-room for men, together with the tropical conservatory, with its stained glass and invalid chairs for valetudinarians, help to pass the time less wearily. To each patient a separate closet is assigned, and to each ward its own pantry, ice-box, and other conveniences. In the beautiful synagogue divine worship is conducted by a rabbi. Any one desiring Christian ministrations may send for priest or pastor. Six times a day is food set before the patients. In the hydrotherapeutic room the sweat-baths for consumptives, rheumatics, and sufferers from heart complaints have been instrumental in restoring seeming incurables to health, or to such physical condition as warrants discharge; after which watchful beneficence continues to minister until satisfied that its subjects are able to earn a livelihood for themselves.

Of hospitals like Mount Sinai, on Sixty-sixth street and Lexington Avenue, and the new Jewish Hospital,—once an Ursuline convent,—New York Judaism is wholesomely productive.

Dispensaries, too, it establishes, and shrewdly charges a small sum for medicines when beneficiaries use or waste too much of what has been dispensed gratuitously. About eighty per cent. of the Mount Sinai patients are of Jewish faith; but those of other religions, or of none, are as freely admitted—a catholic philanthropy acknowledged by a bequest of \$60,000 from Miss Sarah A. Burr. Hygiene is scientific and practical, cleanliness apparent, seclusion secured by screens around the sick, and, when especially required, by separate rooms. Kindness, embodied in the motherly nurse, lays caressing hand on the head of an infantile Judas Maccabæus, and wonders how heartless parents can desert their offspring.

Attached to the hospital is the Mount Sinai Training School for Nurses, of whose twenty-five, more or less, excellent yearly graduates only four or five are said to be Jewesses. Literature and religion are here held to be accessory to curative process. Worldly amusements, too, are not despised as helps to humanity. The fancy-dress ball of February 28, 1889, in aid of this institution, put \$15,158.96 into its treasury.

Of the Home for Aged and Infirm Hebrews, with 142 inmates, on One Hundred and Fifth

PORCH OF TEMPLE BETH-EL.

street, between Ninth and Tenth avenues, the Home for Benai Berith in Yonkers, the Sanitarium for Hebrew Children at No. 124 East Fourteenth street, and also that at Rockaway, Long Island, it is enough to say that in respect of provision, appointment, and efficiency they are on the same plane with the average of Christian enterprises of like character. The Home of the Benai Berith, with upward of sixty inmates, is maintained at an annual cost of about \$17,000, raised by a per capita assessment of two dollars on every member of the order. Residents are not regarded as paupers, but as

LIGHTING THE PERPETUAL LAMP AT THE CONSECRATION OF TEMPLE BETH-EL.

men who by past payments have acquired the right to its advantages.

Foremost among Jewish philanthropic associations are the Down-Town Hebrew Ladies' Benevolent Society, Hebrew Emigrant Aid Society, Ladies' Deborah Nursery and Child's Protectory, Young Ladies' Charitable Aid Society, and Young Ladies' Charitable Sewing Society, all of which are unceasingly active in eleemosynary toil.

Immigrants are mutually helpful. "Chevras," or beneficent societies, composed of people from the same localities in Europe or Asia, are extremely popular. Religion and reciprocity blend in them. The Gemilath Chesed Shel Emeth celebrated in January, 1891, its jubilee of fifty years with much feasting and giving of presents.

The United Hebrew Charities of the City of New York,—consisting of the Hebrew Benevolent and Orphan Asylum Society, Hebrew Benevolent Fuel Society, Hebrew Relief Society, Ladies' Hebrew Lying-in Society, and Congregation Darech Amuno Free Burial Fund Society,—now in the eighteenth year of its singular usefulness, directed by able mercantile and professional citizens, and with judicious economy of resources striving to attain the best results through careful division of labor, is one of the noblest humanitarian organizations on the continent, and compels warmest praise from those who know it best.

Poverty, through immigration and other causes, grows faster than means of prevention or relief. Gifts, subscriptions, fairs, Purim balls, and civic appropriations cannot satisfy its cravings. Its bitterness is intensified by disappointment. New York is not the Ophir or the El Dorado pictured by selfish steamship agents. In the year ending September 30, 1890, applications for relief to the number of 5170, involving 19,143 persons, were received and acted upon. Relief in cash was given to 1043, in supplies to 1719, in transportation to 2959, and in employment to 3833, among whom were physicians, teachers, mechanics, electricians, architects, and business managers, as well as peddlers and artisans. The aggregate of beneficiaries was 28,696. Of Russians 2912, and of Austrians 1131, figured among the recipients. Receipts of the union were \$104,523.83, and expenditure \$105,090.77. Of \$150,000, more or less, received and expended in 1891, the cost of administration was only seven per cent.

The objects of the union are to minimize pauperism, return the deluded and incapable (1204 in 1890) to former abodes, help the ambitious to help themselves, root out superstitious notions, strip off uncouth manners, infuse broad and kindly sympathies, cultivate

cleanly and industrious habits, and implant loving loyalty to their adopted country.

It speaks well for these despised foreigners that their appeals for aid so often take the form of pleading requests for work, that the large majority keep the places found for them, that they quickly become self-supporting in this "country of workers," and that while sometimes charged with incapacity, not one of the 3833 for whom employment was found in 1890 was reported to the office as dishonest.

Into all the plans of the United Hebrew Charities the trustees of the Hirsch Fund have spiritedly entered, and in six months of 1890 at a cost of \$18,858. They aid temporarily the newcomers, but appropriate most of their income to industrial education, domiciliary improvement, and agricultural settlements. Whatever shape the charities take on is in harmony with the reports of competent visitors and expert officials.

"Sisterhoods of Personal Service," originated by the Rev. Dr. Gottheil, zealously supported by the Temple Emanu-El, multiply within the Jewish Church. Pecuniary subscription is not invited, but personal service is earnestly besought. Where this is rendered funds flow into the treasury abundantly. The King's Daughters, "a society of Christian ladies to whom we owe many acts of kindness to our poor," suggested organization to the "Daughters of Israel," whose silver badges, bearing the inscription, "Love thy neighbor as thyself," prompt the visitation of the sick and needy, maintenance of kindergartens, religious and industrial schools and nurseries, rescue-homes for the fallen, and adoption of the most faithful communal and congregational activities. One young lady's sorrow for the little ones in homes of squalor and destitution, and her consequent gifts of picture-books and games, originated in hearing of a miserable waif who utilized a dead cat and an empty tomato-can as toys. The good accomplished by these sisterhoods can hardly be overestimated. Uplifting power through personal service to the fallen is one of the social forces that they are quick to wield. "Through the self-sacrifice and uplifting power of the early [Christian] church a great impetus was given to civilization," is a significant Jewish utterance. Feminine service in this novel yet ancient form is warmly greeted. Rabbinical and lay coöperation is enthusiastic. Danger of overlapping charities is avoided by restriction of each sisterhood to a defined district and by relation to the "Charities" as a kind of central bureau. The latter represents the head and the former the heart of metropolitan Judaism, and both work together in concord.

Public libraries, sustained in whole or in part by Jewish liberality, are creations of com-

mercial instinct, reverence for the past, and preparation for the future. The Aguilar Free Library Association, with depositories of books and current literature at 721 Lexington Avenue, 206 East Broadway, and 624 Fifth street, provides a free reading-room at each point for both sexes, all races, and believers in any creed, or in none. Cozy, warm, and well lighted, the chambers in Lexington Avenue draw more Gentiles than Jews. Among the periodicals on the table are the monthly "Old and New Testament Student" and the quarterly "Hebraica," both edited by Professor W. R. Harper; all the great monthlies, including English and American illustrated magazines; and also journals of political science, the weeklies, etc. Books on the shelves are of similar catholic character. Christian theology is not excluded. About two hundred volumes relate to purely Jewish subjects, and among them the "Guide to the Perplexed" of the great Maimonides is conspicuous in three volumes. Daily readers average 275, of whom about half are Christians. Of the 15,000 volumes in the three libraries, a moiety of the circulation is among the juveniles. Part of those in demand at East Broadway are in Jüdisch-Deutsch jargon. Musical and literary entertainments elevate popular tone and taste, and delight attendant Hebrew and non-Hebrew alike. A civic appropriation of \$5000 per annum aids in this diffusion of educational influence, but does not admit of large augmentation of means. The Maimonides Library of the Benai Berith, in Fifty-seventh street, near Third Avenue, is an independent institution, admirably administered, and circulates between 40,000 and 50,000 volumes every year.

By the very necessities of its nature modern Judaism addicts itself to clubs and beneficent organizations. Of the latter the "Benai Berith," Sons of the Covenant, founded in 1843, and receiving lifelong fostering from the erudite and many-sided Benjamin F. Peixotto, is the most powerful. It aims at the good of the brotherhood and of Israel at large; promotes coöperation in provision for the needs of members and their families in education, philanthropy, and culture; encourages the training of youth in handicrafts, and of men of all ages in agriculture; seeks to convert the exiled immigrants into self-reliant citizens, and to cultivate the amenities of highly civilized society. Confluent Jewish life needed its ministrations. "Minhagim," or rituals, were diverse as the lands whence the ritualists came, and occasioned discussion and strife. Contention spread to the social circle. The emancipated ones, so reformers assert, practised oppression in turn, ostracized all who would not pronounce their shibboleth, and pretended to uphold the

customs and usages of traditional antiquity as an infallible guide for the present and future. But the vast accretions of Selichoth, etc., depicting Israel's sorrows in the deepest colors, and bitterly invoking vengeance upon the oppressors, were so utterly unsuited to residence in the Great Republic that they neither inspired reverence nor stimulated devotion. Adaptation of the liturgy to altered circumstances was imperatively requested. Collision was of the letter, not of the spirit; of liturgy, not of principle. The old rituals had fulfilled their mission, and lost much of their meaning. The Benai Berith was instituted to lead all parties out of the blinding dust of antiquity into the pure air of ideal ethics, to free them from the fetters of prejudice, lift them to a higher plane of thought and feeling, to intelligent consciousness of revealed religious truth, and to common participation in beneficent work. Progress was tardy. Sure growths are almost always slow. Order was evolved from chaos, and in that order lay the possibility of future magnates like the Mosaic triad, Josephus, and Montefiore. "Tribes of the wandering feet and weary breast," commingling in the commercial metropolis, developed the hereditary love of free institutions, and under conditions of equality before the laws of the land soon learned to think and act as true American citizens. "In essentials unity, in non-essentials diversity, in all things charity," is the compound maxim selected as a working guide. Sephardim, Ashkenazim, Moghrabim (Arabic Jews), and reformed may still use various rituals, while all unite in communal charities.

Of clubs the Harmonie, Metropolitan, Freundschaft, and Progress afford examples suited to the purses and social status of the members. The latter, located on Sixty-third street and Fifth Avenue, is a fine example of architecture, interior splendor, and scientific adaptation. The ladies' reception-room is simply gorgeous, and the painted ceiling in the best style of French art. The ladies' parlor is resplendent with satin, Mexican onyx, and ro-coco furniture. "Paul and Virginia" and "Reception of Albrecht Dürer" are paintings, and the "Whisperings of First Love," a white marble statuette presented by the ladies, is a sculpture, that expressively indicate the this-worldliness of the association. Thursday night is set apart for feminine friends, who there indulge in bowling and other amusements. Chess and billiards are for the men, chess being a generic term that may or may not include cards—possibly baccarat. The ball-room is said to be the largest and handsomest on the globe. Mythological paintings on linen adorn its walls, while 105 electric lights, each over the head of an esthetic figure, flood the scene

with wondrous brightness. Kitchens, dining-room for 600 guests, refectories for small parties, electrical ventilation, artistic sanitation, blending of Orient and Occident throughout the building, justify the outlay of \$600,000 upon it and the site whereon it stands. Membership is without distinction of race or creed, and recently reckoned 420 persons, of whom one was a Christian.

Adepts in the art of distilling from material things the essence that inspires but not inebriates, the home life of Jews in New York is, with comparatively few exceptions, one of innocent joyousness. Different congregations give entertainments to members and friends, in which they strive to strengthen Judaism by lectures, recitations, and songs. The Mosaic law, and its influence upon modern life through Christianity and Mohammedanism, is not an infrequent or unpopular topic. In devising expedients for beguiling dollars from unwilling pockets into society treasuries, the young people, and particularly those of the gentler sex, can "give points" to the most ingenious and successful of other creeds. Saltatory amusements at "brilliant and successful" balls are laid under contribution to intellectual and moral culture, and also to the mitigation of human suffering. Free synagogical schools, in which lessons are given on several days of the week, are supported in part by this fashion.

Of theatrical and operatic entertainments the Hebrews are passionately fond. The Oriental Theater in the Bowery advertises such plays as "The Usurer," "Uriel Acosta," and "The Only Son" in Jüdisch-Deutsch, at fifteen cents admission. Price is equal to program, whether there or in the National Theater or the Thalia Theater, which are also in the Bowery. The last, sometimes known as the Roumanian Theater, is crowded nights with wearers of dignified broadcloth and women refulgent in silks, velvets, and jewelry. Wealth is portable, and more gratifying thus to the owners than when deposited in bank or safety-vault. Such repositories in the Old World have often failed them in respect of security. Each prefers, for some years at least after settlement in New York, to be his own banker. The theater is crowded with eminently appreciative and good-natured people, whose applause, if not vociferous, is sincere and oft-repeated. The play is of Hebrew history and characteristics throughout; actors and actresses are unmistakably Jewish, and enact their parts with exuberant energy. German and Italian operas find liberal patrons in wealthier and more cultured Hebrews, whose coreligionists have been and are among the leading playwrights, composers, and musicians of civilization.

In literature the Jews of New York are pro-

lific. Emma Lazarus was a bright particular star, whose luster was too quickly extinguished by death. Journalism is particularly congenial to the Semitic temperament. The "Jewish Gazette" and the "Jewish Herald" appear in Hebrew characters, the "Jewish Messenger," "Hebrew Journal," "Jewish Standard," and "American Hebrew," in the English language. So does the monthly "Menorah," a magazine published by the Benai Berith, and which, in common with the "American Hebrew," is the incarnation of ordinary good sense—ethical, religious, and political; positively denominational withal, and adverse to purposeful conversionism, because it impliedly affirms lower religious and moral status on the part of the Jews. It prefers similar relation to that of Presbyterian to Methodist, or of Roman Catholic to Episcopalian.

Light is knowledge, and to spread its glory
Far as pen can reach or tongue can tell—
Rays of truth from science, art, or story—
Is the blessed law of Israel.

—*Miriam del Banco.*

Ethics are ever superior to morals, even in the best of communities. Nowhere are Jews exceptions to the general rule. Accepted orthodox code postulates the natural purity of the soul, which is "the portion of the Divine Spirit which God gave to man," responsibility for moral conduct, dependence on divine love, perfectibility of character, and eternal salvation through the merit of holy living. That prayer should be in practical righteousness is indicated by the washed hands of the supplicating rabbi. Why women, with their natural devotion, should be excused from its public exercise is not clear to Christian observers, who can scarcely fail to applaud the sternness with which they are said sometimes to refuse breakfast to husbands until the latter have officiated as priests of their own households. Prayer, whether offered in orthodox fashion three times a day or not, is, like the observance of the Torah, intended to lead to supreme love of the Deity, and love of others, measured by the love that the wise man bears for himself. True sacrifice is held to be that of "some of our individual views and wishes for the interest and benefit of the community in general," "of our greediness for wealth, and other numerous passions and desires which we allow to stand in the way of serving our Maker with sincerity." All external sacrifices, "without universal love and charity to our fellow beings," are unavailing.

Reformed Jews are sublimely theistic, believing that the God they adore is the Father of all, and that men are his sons, "endowed with his light of reason and drawing life from his empyrean of love." Rabbi K. Kohler, D. D.,

as the exponent of their views, admits "no partiality of creed, no monopoly of heaven, no hell for heretics, no damnation for sinners. All life [is] but one Revelation of God, all humanity but one Kingdom of Righteousness, and whosoever is clean of hands and pure of heart is on the road to the sunlit hills of blessedness forever."

Optimistic in sentiment, their professed aspirations are to the beautiful, the pure, the true. To them the Jew is a perpetual miracle, one of the corner-stones of civilization, and a humble servant in the temple of humanity. "Not creed, but deed," is his motto. His mission is to aid in humanizing religion and in religionizing humanity.

Such, in brief, are the doctrines taught in the magnificent Temple Beth-El, Fifth Avenue and Seventy-sixth street, erected at a cost, including site, of \$600,000, and dedicated to the service of the Eternal in September, 1891. Its union of Byzantine and Moorish characteristics, gilded dome and bronze gates, space for more than two thousand worshippers and numerous Sunday-schools, make it one of the most conspicuous edifices on the margin of the beautiful Central Park. Architecture and ornamentation, procession of boys and girls (one of the feminine confirmants carrying the golden key) led by congregational officials and ministering rabbis who bore the scrolls of the law, singing of children's and adult choirs, ceremonious deposit of scrolls within the ark, kindling of the perpetual lamp—emblem of life eternal and truth unfading—by the venerable Lazarus Straus, ritual and sermons, spirit-stirring hymn composed for the occasion by Mrs. M. D. Louis, and the glad devotions of the multitude, were intended to express all that is brightest, best, and most prophetic of good in the reformed Jews of New York.

Modern Judaism claims identity with that broad humanitarianism of which it regards Baron de Hirsch as an illustrious exemplar. To him the union of American Hebrew congregations in session at Baltimore in July, 1891, said by telegraph: "As American citizens we feel that you have interpreted aright the motto of Judaism, which is, 'My country is the world; my countrymen, mankind.'"

With all this catholicity of spirit the local Jew unites intense loyalty to the country in which he lives. In Russia he is an imperialist; in Germany, Great Britain, and Italy a constitutional monarchist; in France and the United States of America, a democratic republican. Everywhere, as an exponent of established order,—except where brutal tyranny has driven

him into anarchism, or political injustice into multifold socialism,—he is a government official, and often, like Disraeli in England, Lasker in Germany, and Crémieux in France, of the highest grade. "Israel," writes the Rev. Dr. Bernard Drachman, "must assimilate itself to the conditions and culture of the nations among whom it dwells, and whose citizenship it enjoys. Especially in this country, where the full rights and privileges of citizenship and equality are ours, it is our duty to become completely Americanized in language and culture; but we need not on that account sacrifice our identity, nor give up the beautiful and sacred language and literature which we have inherited as Jews."

Some Christians question whether the instinct of Jewish nationality be not entirely extinct. Others affirm that it is imperishable. Under the ashes glow its wonted fires. It cherishes "audacious aspirations after renewed nationality." Who will say that the dream, or prophecy, of repatriation in the old Solomonic empire shall not be realized? Despite the enmity of the Sublime Porte, a center of national life is already fixed at Jerusalem. Whereunto it may grow depends more upon the Universal Israelite Alliance, and the overwhelming political support it can command, than upon the will of bigoted czar or "unspeakable Turk." The quarter million of Jews in New York, with representatives in the judiciary, legislature, and every department of civilized activity, are acquiring the qualifications for leadership in the land of their fathers, if in the fullness of time they may choose there to settle.

That there is deep and wide-spread popular prejudice against the Jews is undeniable. The best and noblest are freest from its unreason and injustice. These respect the right of private judgment and insist upon freedom of choice and action. When Jews like Disraeli, Erlanger, Neander, Edersheim, and Heine become Christians, the change is defensible and normal from the American standpoint. But when Christians become Jews, as they do occasionally in New York, what then? Is the change less defensible when criticized from the same platform? Each is responsible to pure reason, and to the Judge of all, for his conduct in this particular. Truth and right have nothing to fear from the endless mutations of human thought and passion, and in the outcome must be triumphant. Ethics fundamental to biblical Judaism and Christianity alike must be applied with equal impartiality to men of all races and religions, and each be held, rigidly yet lovingly, to strict responsibility under their rule.

Richard Wheatley.

RECENT DISCOVERIES CONCERNING THE GULF STREAM.

THE subject of ocean currents is one that has engaged the attention of practical and scientific men for centuries. There is no part of the vast expanse of waters but has a movement, either due to tides or to a regular, constant flow; and an accurate knowledge of the laws relating to these movements is of great importance to mankind. Many branches of scientific inquiry are concerned in their examination, for they bear directly upon the dissemination and evolution of species, and the deposit and structure of geological formation, while in the every-day business of the world they enter as a factor in the price of everything that is carried afloat as well as in the safety of all those "that go down to the sea in ships."

The currents of the ocean are the great transporters of the sun's heat from the torrid zone to temper the climate of the polar regions. It is argued by some that such a stupendous change as that which occurred in Europe and America at the time of the glacial period was caused simply by a deflection in the currents in the northern hemisphere whereby its share of tropical heat was partly diverted toward the south.

In the three great oceans, the Atlantic, the Pacific, and the Indian, there is to be found a similar circulation—a general westerly movement in the tropics, a flow toward the poles along the eastern shores of the continents, an easterly set in the temperate zones, and a current toward the equator along the western shores. This system thus becomes a grand circular movement, some parts being very slow, but still quite constant, and other parts very swift. There are offshoots here and there, due to local causes, and perhaps in the slowly moving current there may be a temporary interruption, but, taken as a whole, the movement is continuous.

The part of this circulation flowing along the eastern coast of the United States is the greatest of all these currents, and, in fact, is the most magnificent of all nature's wonders. This is the Gulf Stream. When you are on board a vessel floating upon its waters, there is nothing remarkable in the surroundings, so far as the sight is concerned, which cannot be seen in many other places on the earth's surface. You look over the vessel's side and see a beautifully clear water, with perhaps a little seaweed floating on its surface, a dolphin or a shark playing about the ship, a school of flying-fish darting out of

the water and skimming over the waves, myriads of little animal life sparkling like motes in the sunlight; but all of these sights are not enough to impress the beholder as being anything different from what might be expected at other places. You put your hand into the water, and find that it has a summer temperature. When the captain takes his observation of the sun to ascertain the position of the vessel, and you find that she has been moved over the surface of the earth a hundred miles more than the motive power of the engines could drive her, you begin to think that there is something wonderful in the force of the Gulf Stream.

THE GULF STREAM NAMED BY FRANKLIN.

THE name Gulf Stream was first suggested by Benjamin Franklin, because it comes from the Gulf of Mexico. While it is a portion of the grand scheme of ocean circulation, and the Gulf of Mexico is in reality only a stopping-place, as it were, for its waters, the name is generally applied to the current when it reaches the Straits of Florida, north of Cuba. In the large funnel-shaped opening toward the Gulf of Mexico the current at first is variable in direction and velocity, but by the time Havana is reached it has become a regular and steady flow. As it rounds the curve of the Florida shore the Straits contract, and the water then practically fills the banks from shore to shore and reaches almost to the bottom, which is at this point about three thousand feet deep. I say almost, because in the changes which are continually going on, sometimes it does and sometimes it does not reach the bottom. As it leaves the Straits of Florida its course is about north, but it gradually changes its direction, following approximately the curve of one hundred fathoms' depth until it arrives at Cape Hatteras. From this point it starts on its course to Europe. It has lost something in velocity as well as in temperature, and as it journeys to the eastward it gradually diminishes in both, until it becomes a gentle flow as it approaches Europe.

SIZE AND STRENGTH OF THE GULF STREAM.

PEOPLE think the Mississippi River a grand stream, and it is so in truth, as far as land rivers go; but, great as it is, it would require two thousand such rivers to make one Gulf Stream. The great ocean river is an irresistible flood of water, running all the time, winter and summer, and year after year. It is as difficult for the mind to grasp its immensity as it is to realize the distance of the nearest stars. At its narrowest part in the Straits of Florida it is thirty-nine

miles wide, has an average depth of two thousand feet, and a velocity at the axis (the point of fastest flow) of from three to more than five miles per hour. To say that the volume in one hour's flow past Cape Florida is ninety billion tons in weight does not convey much to the mind. If we could evaporate this one hour's flow of water and distribute the remaining salt to the inhabitants of the United States, every man, woman, and child would receive nearly sixty pounds.

Even those who navigate its waters do not fully realize the strength of its current. Two or three years ago a government vessel was anchored in the Stream observing the current. The wind was very light when a sailing vessel was sighted ahead, drifting to the northward. As she came nearer and nearer it became evident that there would be a collision unless steps were taken to prevent it. The crew of the sailing vessel trimmed their sails to the gentle air; but it was useless, for onward she went, carried by the irresistible force of the current directly toward the bow of the steamer. As the vessels approached each other, by a skilful use of the rudder on board the steamer she was moved to one side, and the sailing vessel drifted past a few feet distant. The captain of the latter was as astonished as he was thankful that his vessel was not lost. All that he could cry out in broken English as he flashed by was, "I could not help it; the water bring me here."

It is curious to note in the history of the Gulf Stream how great its influence has been on the fortunes of the New World. Before the discovery of America strange woods and fruits were frequently found on the shores of Europe and off-lying islands. Some of these were seen and examined by Columbus, and to his thoughtful mind they were confirming evidence of the fact that strange lands were not far to the westward. These woods were carried by the Gulf Stream and by the prevailing winds from the American continent, so that in part the Gulf Stream is responsible for the discovery of the New World. Ponce de Leon, while on his famous search for the Fountain of Youth, made the discovery of this more practically beneficial phenomenon. After his failure to discover on the coast of upper Florida the means of cheating death, he turned to the southward, and skirted the shore for hundreds of miles, thus stemming the current. Referring to these currents, his journal describes that they found a current that, though the wind was good, they could not stem. It seemed that their vessels were going fast through the water, but they soon recognized the fact that they were being driven back, and that the force of the current was stronger than the wind. Two vessels that

were somewhat nearer the coast came to anchor; the third vessel, a brig, being in deeper water, could not anchor, and was "soon carried away by the current, and lost from sight, although it was a clear sky." We can only imagine what must have been the thoughts of these superstitious people when they saw their companions being carried by a fierce current into a region entirely unknown. The brig returned some days afterward, probably much to the relief of all.

Shortly after this, one of the vessels of Ponce de Leon's fleet was detached from the main expedition to explore the Bahamas. The pilot of this vessel was a man named Antonio de Alaminos, who became, by the experience thus gained, a most valuable acquisition to other explorers in those waters. He was successively with Cordova and Grijalva in their voyages to Yucatan and the Gulf of Mexico, and finally was selected as the chief pilot of the expedition of Cortes to Mexico. Afterward, when it became necessary to send an envoy to the King of Spain with despatches and presents, Alaminos was chosen as the one most able successfully to carry out the nautical part of the mission. He sailed from Mexico, and, in order to avoid foreign enemies and domestic rivals, took a route north of Cuba and through the Straits of Florida, thus becoming the first to utilize the Gulf Stream for the purposes of navigation. Before this time the homeward voyages were east of the Bahamas. Soon afterward Havana became the chief port of the West Indies. Situated in the Straits of Florida, it was easy of access to vessels bound to and from Europe. By going through the Caribbean Sea and around the western point of Cuba, the vessels had a favoring current all the way, and on the voyage homeward the Gulf Stream was a sure assistance. Havana became, therefore, the rendezvous and distributing point of the Spanish possessions in the New World.

The navigation of the sixteenth and seventeenth centuries was crude at best, but so great a factor was the Gulf Stream that expeditions of colonization failed more than once because, through a want of knowledge, they tried to stem its current instead of avoiding it. Sir Humphrey Gilbert, in explaining the reasons which led to the failure of his expeditions and the arguments in favor of the two routes of approach, through the trades or across the North Atlantic, says, "The first course,—that is, from the south northward,—was without all controversy the likeliest, wherein we were assured to have the commoditie of the current, which from Cape Florida setteth northward, and would have furthered greatly our navigation, discovering from the foresaid cape toward

Cape Breton all those lands lying to the north." The advantage of being able to provision the vessels with fish caught on the Banks of Newfoundland led him to accept the northern route, and his expedition failed.

The division of the English colonies, later, into New England and Virginia was probably in part due to the routes by which they were reached. Vessels bound from England to New England crossed the North Atlantic outside the limit of the Gulf Stream, or in a feeble adverse current. This voyage was thought to be impracticable with a vessel bound to the southern colonies. They sailed south to the trade-wind region, through the Caribbean Sea and around Cuba, thence following the Gulf Stream to their port. The Dutch afterward adopted the latter passage in going to their colony on the Hudson, so that Nantucket Island really became the dividing line between the two voyages. A difference in destination of one or two hundred miles caused a difference in the length of the passage of about three thousand miles.

The whalers of New England were the first to gain a fairly accurate knowledge of the limits of the current between America and Europe, by following the haunts of the whales, which were found north of one line and south of another, but never between the two. This, they reasoned, was the Gulf Stream current. Benjamin Franklin received this information from the whalers, and published it on a chart for the benefit of the mail-packets plying between England and the colonies. The chart was first issued about 1770, but was not accepted by the English captains. Before it came to be generally known and used the trouble between England and the colonies began, and Franklin, knowing the advantage the knowledge would be to the British naval officers, suppressed it all he could until hostilities ceased.

The current divides into two branches as it approaches Europe, one flowing to the southward, along the African coast, and one toward the Arctic Ocean. Both are very slow in their movements, but the latter is of sufficient magnitude to force a return current along the coasts of Greenland and Labrador, which carries immense fields of ice and enormous bergs past the Newfoundland Banks and across the shortest steamer track to Europe. This ice, together with the fog which usually accompanies the meeting of currents of such markedly different temperature, compels those steamers seeking safety rather than economy and the quickest passage to make a detour around the ice limits, thus lengthening their voyages materially. The track of the steamers bound to the eastward is farthest to the southward, so as to be near or within the edge of the favoring current,

while the route of the steamers in the other direction is as near the ice limit as prudence will allow, and as far removed as possible from the adverse current.

THEORIES.

THE theories as to the cause of this and other ocean currents have been very numerous. Columbus thought that the waters, the air, and the stars all partook of the same motion around the earth from east to west. He brought forward as evidence of the great force of the current in the West Indies, that the Windward Islands were caused by the land being washed away in places, thus forming the islands. Toward the end of the seventeenth century the idea seemed to prevail that the ocean circulation was maintained by means of subterranean passages or abysses. A current at the end of its circuit, or upon meeting land, was supposed to descend into the bowels of the earth, and to appear again on the other side of the land, or very far distant, where it started again on its journey. A little later a theory was advanced that the sun evaporated so much water at the equator that a current was forced to run along the coast of Africa to fill up the hollow. Another was that the heat of the tropical sun attracted so much that a long mountain of water was formed. This was supposed to be carried around the earth until it met the obstruction of land, where it would divide and thus cause side currents. In comparatively recent times the cause of most currents has been laid to the rivers, and of the Gulf Stream chiefly to the Mississippi. The flow of all the rivers in the world will not equal the volume of the Gulf Stream alone. Some eminent men have attributed the currents to the revolution of the earth. It is said that the water, being fluid, does not fully partake of the revolution of the earth from west to east, but is left behind as it were. Many have decided that differences in the density of the ocean at the poles and the equator cause a flow from the latter on the surface and from the former along the bottom. The surface equatorial water is warm and light, while at the poles it is cold and heavy. The latter is said to sink, and is replaced by a surface current from the equator. This in turn draws its supply from the depths, and so a vertical circulation is maintained. Franklin's theory, which has many advocates at the present day, is that the winds produce the current by the friction of the moving air on the surface of the water. None of the theories have been based upon direct evidence, but all are inferences drawn from temperatures, school-room experiments, the drift of vessels, or from reasoning based upon opinions of what ought to be.

THE GULF STREAM SCIENTIFICALLY EXAMINED.

AN immense amount of labor has been devoted toward attempting to define the limits of the currents. Columbus was the pioneer in the investigation of the Gulf Stream, or rather of the equatorial current, which is a part of the grand circuit. On his first voyage, when he was nearing the West Indies, he was sounding one day with a long line and weight, when he noticed that the line inclined toward the southwest, from which he concluded that the surface water was moving faster in that direction than was the lower stratum which contained the weight. Benjamin Franklin endeavored to utilize the thermometer to indicate the presence of a tropical or polar current, and so evident did it appear that this could be done that the idea became an accepted fact in navigation, and at the present day is believed in by many seafaring people. Various governments issued instructions to their naval officers and requests to their merchant marine to keep a record of temperatures of the surface water, and by a compilation of these data the supposed limits of most currents were placed upon the charts.

The importance of a complete knowledge of the Gulf Stream to the commercial interests of the United States was recognized by Congress in the passage of an act authorizing the Coast Survey to include it within the scope of its examination. Later, authority was given to investigate the Sargasso Sea (the body of water in the Atlantic lying at the center of the grand circular movement of currents) and also the mate to the Gulf Stream in the Pacific, called the Black Stream of Japan. The first regular and systematic examination of the Gulf Stream was made by the United States Coast Survey while under the superintendence of Professor A. D. Bache, between 1844 and 1860. Reasoning on the same basis that the current could be defined by its temperature, he caused many thousands of thermometrical observations to be taken on lines extending across the Stream at intervals from Key West to beyond Nantucket. He found by this means that all along our coast the surface is divided into bands of warm and cold water. They are spread out or separated at the northern end, and converge at the Straits of Florida. The warmest band, Professor Bache concluded, was the axis or the swiftest current, and each of the others was a part of the Stream, which spread as it increased its distance from the tropics. The cause of the cold streaks was supposed to be irregularities in the bottom over which the current runs; but this was based upon erroneous measurement of the depths, and in recent years, with better instruments, the bottom has been found to be nearly even.

Another method of approximately determining the current has been in use since the introduction of accurate navigation. A vessel at sea is moved by the wind or by engines as nearly as possible on a certain course and distance, but she is deflected from that course by winds, waves, currents, etc., to an unknown amount. By astronomical observation the commanding officer ascertains where the vessel is at the time, and the difference between this and the supposed position is called current. It is of course the sum of all the errors of observation, of leeway, of compass, and of steering, combined with current, and is of but

succeeded in anchoring in water over twenty-four hundred feet in depth, which at that time was the greatest ever attempted, and observing the surface flow; but the difficulties were so great that a larger vessel and an improvement in methods became necessary. The *Blake*, under the command of the writer, was detailed for the purpose, and permission was granted to use an instrument which he designed for measuring the current from the surface to the bottom.

In the method of anchoring a new departure from the ordinary mode was taken, and, proving to be entirely successful, it is still in

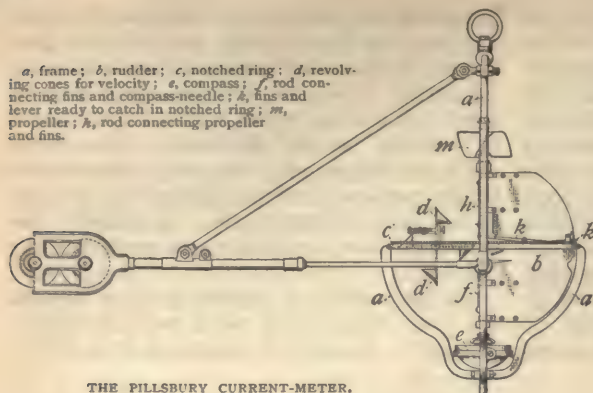

THE "BLAKE."

little practical value to the mariner. Still another method has been practised and even now is somewhat used to determine the flow of currents. Bottles are thrown overboard from vessels at sea, each one containing a paper on which is written the date and position at which it is put afloat, and a request printed in various languages requesting the person finding it to mark the date and locality and forward it to some official. This method is, for many reasons, of but little use. The bottle is tossed by the waves and driven by the wind. If it is picked up on shore, there is no means of knowing how long it has been traveling at sea and how long idle on the beach; and when it is found, all that it tells is that it has journeyed from one point to another in a certain time, but by what route it is impossible to ascertain.

It is obvious that the old methods of establishing the currents, by temperatures or by drift of vessels or bottles, are inadequate, and in 1883 the Coast Survey decided to attempt to anchor a vessel in the Gulf Stream and actually measure the amount of water flowing past. It was thought to be possible to do so by the use of steel-wire rope instead of chain or hemp, as the improvements in the manufacture of the former gave a rope of great strength with sufficient pliability and lightness. The first trial was made in a little schooner, the *Drift*. She

use on board the *Blake* in the current investigation. The great length of wire rope (over four miles) is carried on a large iron spool. A powerful steam-engine lowers and hoists the rope and anchor, while another winds the rope on the spool to be ready for use again. The quick pitching motion of the vessel, pulling the rope violently through the water, makes it necessary to use something to relieve the sudden strain, and for this purpose a large spar projects over the bow. This is hinged at its inside end, and is held up by a long rubber spring. The anchoring-rope is attached to the outer end so that it pulls directly on the spring at every motion of the vessel. With this arrangement the operation of anchoring is so simple and safe that currents have been observed down to thirty-six hundred feet below the surface, the vessel being anchored in depths of more than two and one-half miles.

To gain a knowledge of the laws governing the flow, it is necessary to ascertain the direction and the velocity at all depths from the surface to the bottom. This is done in order to eliminate as much as possible the effect of any abnormal force which may be influencing the current at one place and not at another. The instrument designed for this purpose is in no way complicated. In order to know the direction of the current below the surface, it

THE PILLSBURY CURRENT-METER.

has a rudder which is free to turn in the direction of the flow, and a compass-needle, which of course points to the north. After it has been lowered to any desired depth and allowed to remain a given length of time, it is hoisted to the surface. At the instant of starting its upward motion a simple arrangement of fins, connected with levers, catches the rudder and compass-needle, and at the same time a small propeller begins to revolve by the force of the water. In pulling the instrument through a short distance this propeller locks the compass and rudder in the position they were caught by the fins. To ascertain the velocity, the instrument has an arrangement of revolving cones which, being attached to the front of the rudder, are consequently always toward the current and ready to be turned by the force of the passing water.

The investigation began with these appliances in the narrowest part of the Straits of Florida, in order to find out the characteristics of the Stream at a point where it would be the least influenced by abnormal forces. After two years at this point the research was extended to the western part of the Straits and to the passage between Yucatan and Cuba, to gage the water entering and leaving the Gulf of Mexico. Afterward the equatorial current and the flow between the islands into the Caribbean were examined, in order to compare what may be called the source of the Gulf Stream with the outlet as it leaves the Straits of Florida for the Atlantic. The stream off Cape Hatteras received attention, and also the flow existing in the Atlantic Ocean north of the Bahama Islands.

We are now beginning to realize the magnitude of this "river in the ocean" from actual observation instead of from speculation. The investigation has resulted in many discoveries as astonishing as they are valuable. The average volume of the Gulf Stream flow has been fixed by many hundreds of observations to be nearly ninety billion tons of water per hour.

Perhaps the most valuable is the discovery that the Stream changes in velocity daily and monthly, and that predictions can be made of the times of these changes. It will be remembered that the tides rise and fall daily, this depending chiefly upon the position of the moon in its revolution about the earth. In the same manner the current varies in velocity daily. For example, the equatorial current along the South American coast is running fastest at about six hours before the moon crosses the meridian. Between Cuba and Yucatan the maximum current

is ten hours before, and in the Straits between the Bahamas and Florida the time is nine hours. These variations in some parts of the Stream amount to more than three miles per hour at certain times in the month, and at other times may be less than one mile. It is readily seen how important this information is to the mariner whose chief endeavor is to make a quick and safe passage.

During the month there is another change taking place, which follows the moon in its journey north and south of the equator. The current always runs weakest at the sides, and strongest at some point usually to the left of the middle of the Stream. This strongest point (called the axis) changes its position. Two or three days after the moon has passed the equator, and is going toward the highest declination, the current at the axis is nearest the middle or farthest to the right, and two or three days after the moon's highest declination it has expanded, and the maximum is farthest to the left. Accompanying both these variations, the daily and the monthly, the temperature of the Stream changes, caused by a greater or less admixture of the warm surface with the cold bottom waters. At one time during the day the lower currents incline in direction toward the axis, while again they run more parallel with the general course of the Stream. This causes the surface water to intermingle with the lower water, and to cool. The observations, besides giving definite and decided information as to the actual limit, direction, and velocity of the Gulf Stream, bear strongly upon the question of what causes the ocean currents.

WHAT CAUSES THE OCEAN CURRENTS.

In the tropical regions there is a continued movement of the air from east to west known as the trade-winds. South of a certain line situated near the equator these winds blow from a southeasterly direction, while north of the equator they come from a more northeasterly

direction. The position of this belt on the earth's surface is continually changing. In our winter, the sun being in the southern hemisphere, the belt is farthest south, while in our summer it extends higher into northern latitudes. In the temperate zones the prevailing direction of the wind is in an opposite direction to that of the trades; that is, the winds predominate from the west.

Winds blowing over the surface of water induce a current in the latter. At first it is only the merest skim that moves, but gradually the movement is communicated from layer to layer until at last the whole mass is in motion. To allow the trade-wind to affect the ocean

THE METER READY FOR LOWERING.

over which it blows sufficiently to cause a current to reach the bottom, would require many thousands of years with a steady force and direction. As the winds vary in both (although predominating in one direction), the induced current is shallow and weak, rarely extending much below three or four hundred feet. The superficial current produced by the southeast trades in the Atlantic finally reaches the coast of South America, and divides at its most salient point,

Cape St. Roque. A part of the current then turns south toward the Antarctic, and a part follows along the northern side of the continent toward the Caribbean.

The northeast trade-winds also induce a current, and a part of the latter joins the other outside the Windward Islands, while a part passes north of the Caribbean toward the coast of the United States. All the passages between the Windward Islands carry some of the current into the Caribbean, and it is driven across that sea until it reaches the coasts of Yucatan and Honduras, from which it escapes by the easiest route, which is into the Gulf of Mexico. The water entering the Caribbean by this means is about half the amount which flows through the Straits of Florida from the Gulf of Mexico, and the other half is supplied from a source which does not come under the

head of a measurable current. This other source is the wave caused by the wind. Every ripple carries a certain amount of water in the direction toward which it is moving, and when the waves become large, hundreds of tons of water are thrown from the crest into the trough every time the wave breaks. In a large area like the Caribbean Sea, having a comparatively constant wind blowing over its surface, this action is practically a simultaneous movement of the surface to the westward, and a continual escape of the water heaped up at the obstruction offered by the land. This escape is with the current into the Gulf of Mexico, through the Straits of Florida, and into the Atlantic.

The Gulf Stream, grand as it is in comparison with other ocean currents, would be but little felt on the European coast did it not receive an addition to its volume while *en route*. It will be remembered that a portion of the northeast trade-wind current flows outside the West Indian Islands and the Bahamas. This slow current, meeting the obstruction of the continent in its path, gradually curves to the northward, and joins the Gulf Stream in its journey to the Old World. The temperature of this outside current in its passage along the West Indian Islands is about the same as that of the Gulf Stream, but it is less violent in its movements, and there is less intermingling of its lower and upper waters. It consequently arrives off Cape Hatteras with a much higher temperature than that of the more rapid and turbulent Gulf Stream.

The water thus delivered to the region of the prevailing westerly winds above the thirty-fifth parallel of latitude is moving in a northeasterly direction. The impelling force from behind—the trade-winds—has ceased to act on the surface, and the velocity of the current is consequently diminishing. By the time the Newfoundland Banks have been passed, the Gulf Stream as a separate and distinctly defined body has been almost obliterated, and in its place there is being formed a broad, slowly moving drift caused by the prevailing westerly winds. As this current reaches the obstruction of the European coast the water escapes in two directions, one toward Africa, to join the trade-wind current at the starting-point, and the other toward the Arctic. The latter must also have some means of escape, because the Arctic is a *cul-de-sac*, and as the line of least resistance is on the west side along the coasts of Greenland, Labrador, and Newfoundland, the Labrador current is formed.

IS THE AMERICAN CLIMATE MODIFIED?

THE question is often asked, To what extent does the Gulf Stream modify the climate of

the United States? To its supposed erratic movements is laid the blame of every abnormal season. There is every evidence that the Gulf Stream is governed absolutely by law in all its changes. The course through the ocean is without doubt fixed. Its fluctuations are by days, by months, by seasons, or by years, and they do not vary materially one from the other. Its temperature changes, depending upon the relative heat of the tropical and polar seasons, and upon the strength of the producing trade-winds. The warm water may be driven toward the shore by the waves caused by a favorable wind, but the current remains in its proper place. The warm water gives off a certain amount of heat to the air above it, and if this air is moved

to the land we feel the heat. The presence of the warm water on the coast of Europe would in no way modify the climate if the prevailing winds were easterly instead of westerly. If the prevailing winds in New England in winter were southeast instead of northwest, the climate would be equal to that of the Azores Islands, mild and balmy. For the cause of abnormal seasons we may look to meteorology. The current is in its place ready to give off the heat and moisture to the air whenever the demand is made upon it, but by the erratic movements of the air this heat and moisture may be delivered at unexpected times and seasons, and thus give rise to the erroneous belief that the Gulf Stream itself has gone astray.

John Elliott Pillsbury.

RICHARD HENRY DANA.

I.

O SPIRIT dauntless, whom no danger moved,
 Who loved the heaving vastness of the sea,
 With zest its threat of gale and tempest proved,
 And salty wastes found sweet with liberty;
 When the earth-bounding heaven, sphered above
 Thy country, with the muttering storm did lower,
 When the massed engines of hate and love
 Thundered and flashed with elemental power,
 Like was thy course as when on voyaging bound —
 Steered, veering always by the central star,
 Unseen or seen, straight or rough capes around,
 Where thy soul's pointers led thee, wide and far,
 Sure of the port, gold-gated, that would bless
 With peace, in freedom's law of righteousness.

II.

Let fops and worldlings sniff, and pick apart,
 At foibles carp,—shades that great virtues throw,—
 And try in vain to brand, with specious art,
 Thy life with failure. Thee they could not know.
 Statesman and jurist with no curule seat,
 A patron to the sailor and the slave,
 One prompt the face of jealous power to meet,
 Withstand, and speak the truth, the hard cost brave;
 Leader of hopes forlorn that must be led,
 If country, honor, freedom are to live;
 Of God's elect thou wert, and of such bred;
 Thee patriot saints thy place with them shall give,
 Whose strength in faith and courage ever lies,
 Whose unsought glory crowns self-sacrifice.

Darwin E. Ware.

PIONEER DAYS IN SAN FRANCISCO.

BUILDING OF THE "ALTA CALIFORNIA."

WHEN Captain Montgomery first gave the American flag to the breeze on the Plaza of Yerba Buena on the 8th of July, 1846, let us hope that a certain person was there to see—that native woman who, in Los Angeles in 1842, sang in the hearing of Dufflot de Mofras her song of prophecy: "When the Frenchmen come, the women will surrender; when the Americans come, good-by to California!"

On the day of that flag-raising Yerba Buena was an amiable as well as a picturesque village, and its tenscore of inhabitants,—native Californians, English, Scotch, and Irish, with a sprinkling of Swiss, Swedes, Danes, Kanakas, and Indians,—unvexed by prophetic dreams of the feverish days of gold, were content to hail that gaudy bunting, and the promise of all that it stood for; were content to wait till the commerce of all the seas should find its way to the noblest anchorage the world could offer it.

The ever-expectant citizen of Yerba Buena who, spy-glass in hand, on the last day of that same July, mounted the hill above the cove ("Telegraph Hill" it was to be called) was greeted with a prospect that justified his highest hopes, and inspired him with the raptures to which Benjamin Morell had given expression fifteen years before—"a bay that might float the whole British navy without crowding; a circling grassy shore indented with convenient coves; a verdant, blooming country round about." Here were waving woodlands, and

pastures flecked with grazing herds; hill and dale, mountain and valley, rolling rivers and gurgling brooks. And, looking seaward to where the Pacific pounded at the rocky headlands of the Golden Gate, he descried a ship under all sail, heading for the straits and the bay; a ship carrying the American ensign at her peak, but not a man-of-war, for her decks, and even her lower rigging, were black with passengers—men, women, and children! Again and again, with leveled glass, he peered, confirming the witness of his eyes; then he turned and ran down the hill and around the curving beach of the cove that rested sleepily between the arms of Clark's Point and the Rincon; and presently all the motley multitude of his fellow citizens were swarming from their adobes and their shanties, stirred with the news as the leafy ridges of the Contra Costa were stirred with the sea-breeze.

The ship that let go her anchor that day, off the little island of the "good herb," was the *Brooklyn* from New York, bringing "Bishop" Brannan (the redoubtable "Sam" of a later day) and his colony of Latter-day Saints; and these brought stout hearts, strong arms, and cunning hands; money, tools, pluck, keen wits, and a printing-press. And so, although they quarreled with their very mundane bishop, and went to law with him, and abandoned their scheme of Mormon colonization, and presently made game of Brigham Young in their tents among the sand-hills, nevertheless they gave to San Francisco her first prayer-meeting, her first jury trial, her first local advertising, her first newspaper; for with the same types and press that had once done duty for "The Prophet" in New York, they printed blank deeds, alcaldes' grants, and pronunciamientos, and early in the following January issued the first number of the "California Star," pledged "to eschew with the greatest caution everything that tends to the propagation of sectarian dogmas." A progressive folk, those Mormons of Yerba Buena!

Toward the close of January, 1847, Yerba Buena underwent a change of name, and by summary process and proclamation of the alcalde became San Francisco; for the chief magistrates of those days were a very summary folk, doing a mildly autocratic business each in his little bailiwick, and having small reverence for precedents or principles, but just setting up or casting down according to certain loose notions of their own regarding Mexican

judicature or Californian traditions. And so the first alcalde of Yerba Buena under the American flag, being a naval lieutenant (Mr. Washington A. Bartlett) appointed by Captain Montgomery, and invested with ample powers, military as well as civil, to administer the affairs of the embryo metropolis according to Mexican practice conformed to American ideas, proceeded to the making of history in a small way, building better than he knew. He first changed the name of the place to San Francisco, and then vouchsafed to explain that Yerba Buena was but a paltry cognomen taken from a lot of vulgar mint overrunning an insignificant island; that it was a merely local name, "unknown beyond the district," while San Francisco had long had the freedom of the maps; and finally that it was an outlandish name, which Americans would mangle in pronouncing. "Therefore, to prevent confusion and mistakes in public documents, and that the town may have the advantage of the name given on the public map, it is hereby ordained," etc.

And the alcalde was right: for in 1836 Alexander Forbes had written "the port of San Francisco is hardly surpassed by any in the world"; and ten years later (eighteen months in advance of the Bartlett coup) George Bancroft, then Secretary of the Navy, had instructed Commodore Sloat in relation to the blockade or occupation of "the port of San Francisco," in the event of his (Sloat's) ascertaining with certainty that Mexico had declared war against the United States.

The 5th of March, 1847, brought the ship *Thomas H. Perkins*, with a detachment of the New York regiment commanded by Colonel Stevenson. These men were pledged by the terms of their enlistment to make permanent settlement in California at the close of the war, and they had been chosen for the most part with an eye to their prospective usefulness as skilled artisans or shrewd traders. Thus they constituted an important accession to the population, and, joined with their Mormon predecessors, showed a bold front of energy and confident resources. The air began to be stirred with the bustle of business, and all the talk was of town lots. General Kearney had ceded to the town all the beach- and water-lots on the east front, between Fort Montgomery and Rincon Point; and on the 20th of July two hundred of these lots, lying between the limits of high- and low-water marks, were sold at public auction for from \$50 to \$100 each. These lots measured 45 × 137 feet, and were for the most part uncovered at low tide. In December, 1853, the water-lots between Clay and Sacra-

mento streets fetched from \$8000 to \$16,000 each, although they were but 25 × 60 feet, and at all times under water. In 1847 a fifty-vara lot north of Market street could be bought for \$16. A vara, the Spanish yard, is about 33⅓ inches, and six of these lots made a building block bounded by four streets. Hittell¹ records that, in the seventeen months ending on the 1st of August, "157 houses had been built in a place which had only 30 houses before"; and already it was a city of two newspapers, for in May the "Californian" had come from Monterey and cast in its fortunes with the "smart little settlement on the cove," which, having secured two notable importations of unterrified hustlers, had begun to set competition at defiance, with a total population of nearly five hundred, composed of all nationalities under the sun. Of this number fully one half were citizens of the United States; and these, being stirred by municipal aspirations, bethought them that it was time to give the place a town council and call it a city. So a public meeting was held under a call from the governor, and six gentlemen were elected to constitute an *ayuntamiento*, or council. These were Messrs. Glover, Jones, Howard, Parker, Leidesdorff, and Clark, and their functions were the laying out of streets, the award of building privileges, the regulation of business, the granting of licenses, the appointment of town officers and constables, etc. The enforcement of ordinances and general execution of the laws devolved upon the first alcalde, who was Mr. George Hyde. He was assisted by Dr. T. M. Leavenworth as second alcalde, and by Mr. Leidesdorff as treasurer. Messrs. Glover, Leidesdorff, and Clark were appointed a committee to take measures for the establishment of a public school for the youth of both sexes; but it was not until April 3, 1848, that the school was formally opened. By that time the population had increased to about 850, all told, and the buildings of all kinds numbered two hundred, including two considerable hotels, besides public houses and saloons, stores, warehouses, and two wharves in course of construction. Already the characteristic enterprise of San Francisco had begun to express itself in a brisk development of its peculiar industry: gambling-houses were springing up on every corner, and an ordinance of the *ayuntamiento* provided for the seizure, for the benefit of the town, of all moneys found on any table used for gambling with cards. "Such an ordinance, if enforced a year later, would have enriched the city in a single night; but the act was repealed at the next meeting."²

Early in the spring of 1848 there began to be rumors of gold to be found in the foothills

¹ J. S. Hittell, "A History of the City of San Francisco."

² Soulé, Gihon, and Nisbet, "The Annals of San Francisco": New York, 1855.

of the Sierra Nevada; and presently actual miners appeared in town, showing small parcels of dust and telling tales of wonder that turned the heads of gaping groups met at the landing on the cove and in every place convenient for assembling from Telegraph Hill to Happy Valley. Then the cry went up, and bedlam was let loose. Sailors deserted from the shipping and soldiers from the barracks; the laborer dropped his shovel and his pick, only to return and take them up again — shovels and picks would be useful in the diggings; the mechanic turned his back upon his job; the builder left his house unroofed; the blacksmith and the baker let their fires go out; and the merchant stripped his shelves, huddled his goods into boxes and bales, and shouted at the cove for a launch bound for the Sacramento Valley. The cry of "Gold!" was caught up and reëchoed on the docks and in the market-places of Atlantic seaports, until the world was turned upside down. Every day added to the number of those who were hurrying to the "placers," and the bay was alive with freighted launches crawling up the Sacramento. In May and June the "Californian" and the "California Star" stopped their presses with a farewell fly-sheet. In the middle of July the "Californian" revived with news of affairs in the mines. For two months the ayuntamiento had not met; the city fathers and officials had all gone to the diggings. The public school, which had been closed for two months, was reopened in December, and on Sundays public worship was held there by a Protestant chaplain imported from Honolulu, on a salary of \$2500, raised by subscription.

The first brick house in San Francisco was built by Mellus and Howard on the corner of Clay and Montgomery streets, in September, 1848. In December flour was \$20 a barrel, butter ninety cents a pound, brandy \$8 a gallon, and gold-dust dull at \$10.50 an ounce. Common laborers were getting \$10 a day, and ordinary mechanics \$20. Gold-dust at \$16 the ounce soon became the circulating medium for all purposes of trade. The bay was bustling with small craft, and the sand-hills were thickly flecked with canvas tents and such makeshifts as could be rigged with a pole and two blankets, while the Plaza, and Clay and Montgomery streets, rioted in music and drink and gambling. "Men," says Hittell, "who had lived on five dollars a month now spent hundreds; men who had been idlers formerly were now among the most industrious, and men who had never before wasted a day became loungers and gamblers." And, let us add, men who at home had been blithe, cheery, vital, became despondent, moody, inert, stunned by the mad scramble about them; and men refined, sensitive, keenly

susceptible to impressions of coarseness and depravity, became home-sick, heart-sick, desperate, ready to plunge into the unknown out of the ghastly brutality of such a training as this.

On the last day of February came the steamship *California*, bringing General Persifer Smith to the command of the Military Department, comprising California and Oregon; and on the last day of March the Pacific mail-steamer *Oregon* brought about three hundred and fifty passengers, including Colonel John W. Geary, who bore government despatches to the commanders of the military and naval forces on the Pacific, and brought the first regular mail that was opened in San Francisco. Colonel Geary had been appointed postmaster of the new city, with powers to create post-offices, appoint postmasters, and establish mail routes throughout the territory. Within the next three months more than three hundred square-rigged vessels were lying in the harbor stranded and disabled for want of sailors, the crews having deserted in a body almost as soon as the anchors were let go. Some of these vessels eventually rotted where they were moored; some were hauled up on the beach and in the mud to serve as store-houses, lodging-houses, and saloons; and, at a later period, more than one of them, flanked by buildings and wharves, and forming part of a street, appeared as an original and startling feature of that most surprising town. Thus, the brig *Euphemia* was purchased by the ayuntamiento and converted into the first jail, and the store-ship *Apollo* was used as a lodging-house and drinking-saloon; and as lots were piled or filled in on the flat covered by the bay, the *Apollo* saloon in course of time presented the extraordinary spectacle of the hull of a large ship looming up among the houses. The *Ni-antic*, stripped of her masts and rigging, and propped with piles on each side, lay at the corner of Sansome and Clay streets and served for the storing of merchandise, and when the May fire of 1851 consumed all but the deeper parts of her hull and some of her ribs, a hotel was built on the wreck and called the *Niantic*.

In the first six months of 1849 fifteen thousand souls were added to the population of San Francisco; in the latter half of that year about four thousand arrived every month by sea alone. At first the immigrants were from Mexico, Chile, Peru, and the South American ports generally; but soon our own Americans began to swarm in, coming by way of Cape Horn and Panama, or across the plains; and the number of these was swelled by the addition of thousands of deserters from the shipping, and by a straggling contingent from China, Australia, and the Hawaiian Islands. Probably two thirds of these newcomers proceeded at once to the mines,

but those that remained to try their fortunes in the city were enough to give to San Francisco at the end of the year a population of twenty-five thousand—mostly men, young or of middle age, very few women, fewer children, with here and there a bewildered matron or maiden of good repute. Here were British subjects, Frenchmen, Germans, and Dutch, Italians, Spaniards, Norwegians, Swedes, and Swiss, Jews, Turks, Chinese, Kanakas, New Zealanders, Malays, and Negroes, Parthians, Medes, and Elamites, Cretes and Arabians, and the dwellers in Mesopotamia and Cappadocia, in Boston and New Orleans, Chicago and Peoria, Hoboken and Hackensack.

And how did they all live? In frame-houses of one story, more commonly in board shanties and canvas tents, pitched in the midst of sand or mud and various rubbish and strange filth and fleas; and they slept on rude cots, or on "soft planks" under horse-blankets, on tables, counters, floors, on trucks in the open air, in bunks braced against the weather-boarding, forty of them in one loft; and so they tossed and scratched, and swore and laughed, and sang and skylarked—those who were not tired or drunk enough to sleep. And in the working-hours they hustled, and jostled, and tugged, and sweated, and made money—always made money. They labored and they lugged: they worked on lighters, drove trucks, packed mules, rang bells, carried messages, "waited" in restaurants, "marked" for billiard-tables, served drinks in bar-rooms, "faked" on the Plaza, "cried" at auctions, toted lumber for houses, ran a game of faro or roulette in the El Dorado or the Bella Union, or manipulated three-card monte on the head of a barrel in front of the Parker House; they speculated in beach- and water-lots, in lumber, pork, flour, potatoes; in picks, shovels, pans, long boots, slouch-hats, knives, blankets, and Mexican saddles. There were doctors, lawyers, politicians, preachers, even gentlemen and scholars among them; but they all speculated, and as a rule they gambled. Clerks in stores and offices had munificent salaries; \$5 a day was about the smallest stipend even in the custom-house, and one Baptist preacher was paid \$10,000 a year. Laborers received a dollar an hour; a pick or a shovel was worth \$10; a tin pan or a wooden bowl, \$5; and a butchers' knife, \$30. At one time the carpenters who were getting \$12 a day struck for \$16. Lumber rose to \$500 per thousand feet, "and every brick in a house cost a dollar, one way or another."¹ Wheat flour and salt pork sold at \$40 a barrel; a small loaf of bread was fifty cents, and a hard-boiled egg a dollar. You paid \$3 to get into the circus, and \$55 for a private box. Men talked dollars, and a copper

coin was an object of antiquarian interest. Forty dollars was the price for ordinary coarse boots; and a pair that came above the knees and would carry you gallantly through the quagmires brought a round hundred. When a shirt became very dirty, the wearer threw it away and bought a new one. Washing cost \$15 a dozen in 1849. Rents were simply monstrous: \$3000 a month in advance for a "store" hurriedly built of rough boards. Wright and Co. paid \$75,000 for the wretched little place on the corner of the Plaza that they called the Miners' Bank, and \$36,000 was asked for the use of the Old Adobe as a custom-house. The Parker House paid \$120,000 a year in rents, nearly one half of that amount being collected from the gamblers who held the second floor; and the canvas tent next door, used as a gambling-saloon, and called the El Dorado, was good for \$40,000 a year. From 10 to 15 per cent. a month was paid in advance for the use of money borrowed on substantial security. The prices of real estate went up among the stars: \$8000 for a fifty-vara lot that had been bought in 1848 for \$20. Yet, for all that, everybody made money, although a man might stare aghast at the squalor of his lodging, and wish that he might part with his appetite at any price to some other man. It was some such man as this who preserved the bill of fare of the Ward House for the dinner there on the 27th of October, 1849.

Oxtail soup	\$1.00

OLD STORE-SHIP "APOLLO," USED AS A SALOON.

whole," \$1.50; "rice with brandy peaches," \$2; and "a square meal" for \$3. "All payable in advance. Gold-scales on the end of bar." But the small, cheap gold-scales cost \$30, and the coarse knives and forks not less than \$25 the pair.

The aspect of the streets of San Francisco at this time was such as one may imagine of an unsightly waste of sand and mud churned by the continual grinding of heavy wagons and trucks, and the tugging and floundering of horses, mules, and oxen; thoroughfares irregular and uneven, ungraded, unpaved, unplanked, obstructed by lumber and goods; alternate humps and holes, the actual dumping-places of the town, handy receptacles for the general sweepings and rubbish and indescribable offal and filth, the refuse of an indiscriminate population "pigging" together in shanties and tents. And these conditions extended beyond the actual settlement into the chaparral and underbrush that covered the sand-hills on the north and west.

The flooding rains of winter transformed what should have been thoroughfares into treacherous quagmires set with holes and traps fit to smother horse and man. Loads of brushwood and branches of trees, cut from the hills, were thrown into these swamps; but they served no more than a temporary purpose, and the inmates of tents and houses made such bridges and crossings as they could with boards, boxes,

and barrels. Men waded through the slough, and thought themselves lucky when they sank no deeper than their waists. Lanterns were in request at night, and poles in the daytime. In view of the scarcity and great cost of proper materials and labor, such make-shifts were the only means at hand. A traveler who came by sea in 1849 describes with graphic interest "the peculiar construction of the sidewalk between the store of Simmons, Hutchinson & Co. and the Adams Express office." This place was bridged with cooking-stoves, sacks of

Chile flour, bags of coffee, and boxes of tobacco; and one yawning pit was stopped with a piano. Nevertheless, there were clumsy or drunken pedestrians who would have sunk out of sight but for timely rescue. Hittell tells of two horses that were left in the mud of Montgomery street to die of starvation, and of three drunken men who were suffocated between Washington and Jackson streets. And yet the rains that were productive of conditions so desperate and deadly in the city brought showers of gold to the miners in the diggings, and the monthly yield of dust and nuggets was three times greater after November than it had been in the summer.

Standing on the piazza of the Old Adobe custom-house, on the upper side of the Plaza, or Portsmouth Square, and looking eastward across the open space, you had before you the Parker House and Dennison's Exchange, center and focus of all interest and all news to the San Franciscan of '49; and adjoining the Parker House, on the corner of the Plaza formed by the intersection of Kearney and Washington streets, was the El Dorado, most reckless of gambling-resorts and phenix of many fires. Amidships, on the north side of the square, was the original office of the "Alta California" newspaper, a journal which terminated its existence only a few months ago; and adjoining that, the Bella Union and Washington Hall—alike infamous, the former as a den of gam-

bling desperados and cutthroats, and the latter as a stew of polyglot debauchery.

Southward, on the Clay street side of the Plaza, and on the corner of Kearney street, was that historic adobe, the old City Hotel, the first important hostelry of Yerba Buena; and when the placers began to give out their treasures it was the headquarters of gambling miners, and overflowed with gold. "Scenes such as never before were and never again will be witnessed," said the "Alta California," "were common in the old City Hotel in 1848 and '49." In the spring of '49 the building was leased for \$16,000 per annum, cut up into small stores and offices, and subleased at an enormous advance; but the City Hotel was "gobbled up" in the great fire of June, 1851. Higher up, on the south side, was Sam Brannan's office, where that redoubtable Mormon arraigned the "Hounds" before a concourse

Leavenworth or a Geary; and midway between the Old Adobe and the Parker House stood the original flag-staff, boldly flaunting Uncle Sam's title-deed to the land of gold.

The Old Adobe was a conspicuous landmark in the San Francisco of those wild times, and most dear to the memory of every Forty-niner. In the early days of the American occupation it had been used as a military barrack and guard-house, and later it became the first custom-house of San Francisco. A sedate, drowsy-looking structure, with sturdy brown walls, a low-pitched roof, tiled in the true rancho fashion, a long, rickety porch with planking all adrift, and posts and railings elaborately whittled, the Old Adobe from its coign of vantage on the higher ground overlooked the Plaza and took note of the various devilment that marked its reckless doings; while, with that handy cross-beam at the south end of the porch, it seemed

A MUDDY STREET IN SAN FRANCISCO.

of exasperated citizens, and demanded their summary stamping out. Across the way, on the southwest corner of the Plaza, was the little frame school-house — the first school-house, which became, afterward, a concert-hall for Steve Massett's musical eccentricities, and then a police-station for a most inefficient constabulary. Between the school-house and the south end of the Old Adobe was the alcalde's office, where justice was informally dispensed by a

to wait with cynical patience until the coming vigilance committee should bring their first victim their short shrift and their long rope. The ever-open portal admitted you to a wide vestibule which divided the house into unequal wings, and showed you on one side the desks of the inspectors and deputies, and on the other the sanctum of the collector — an imperturbable and dapper little man whose supernatural equanimity was the admiration of the time and place,

imparting an air of repose and hospitality to all his surroundings, and making even his iron safe, which should have been the grim receptacle of the public treasure, seem but a pleasing and confiding joke, seeing that he usually kept it as open as his own countenance, and free to display its golden lining to the day.

On the 22d of June, 1851, the Old Adobe disappeared from the map of San Francisco, swallowed up in that last great fire which devoured the City Hotel and the City Hospital, the Jenny Lind Theater and the office of the "Alta California." Other adobe houses characteristic of the old California life were the Mowry dwelling and the residence of Señora Briones, both on the northwestern skirt of the town. These were all of one story, and roofed with tiles. The entrance was set fairly in the middle of the front, and there was usually a hall extending from the front to the back door and equally dividing the house, so as to give a large sitting-room, which was also used for a guest-room, on one side of the hall, and on the other a bed-chamber in front and a kitchen at the back. In several of these houses the guest-room and the bed-chamber were floored with tiles of marble in alternate black and white, and the cornices showed some fair attempts at carving; these apartments were always hospitably furnished, and on occasions of entertainment made pretensions to luxury.

The post-office of that time was a frame building of one story and an attic on the corner of Clay and Pike streets. There was but small accommodation here for clerks and "handlers," and still less for the impatient and peremptory crowd of home-hungry men who came daily, but most of all on mail-day, which was once a month, and took the small windows and loopholes by storm. To avoid confusion and dangerous conflict, long queues were formed, extending from the windows along Clay street to the Plaza, and along Pike street sometimes as far as Sacramento, and even to the chaparral beyond. Here traders, miners, merchants, gamblers, and adventurers of every complexion waited in their places, often from the afternoon of one day, all night long, to the morning of the next, in the mud and the soaking rain, with weary limbs and anxious hearts. Men whose strength was unequal to the strain were glad to employ others to hold their places for them through the long hours; and there were those who, while not seeking or expecting letters for themselves, secured good standings in the line before the coming of the crowd, only to sell their right of place to richer men whose time was money. From ten to twenty dollars was a common price for such service.

The gamblers of '49 constituted a controlling class with whom was all the physi-

cal, moral, and financial force. Abounding in ready resources of a mixed and mysterious kind, and unscrupulous in the application of them; themselves well stocked with the adventurer's courage, and their courage imposingly backed up with six-shooters; numbering in their society, whether as professionals or amateurs, many of the "first men" of the city; having the largest show of "smartness," if not of a finer intellectuality and higher wisdom; of sophisticated observation, reckless speculation, and, most important of all, cash; paying the highest rents, monopolizing the most desirable business sites; prompt in applying every new and admirable improvement, commanding every comfort that invention or expensive labor could supply, every luxury that fine raiment, and pictures, and shows, and music, and wine, and a motley "world of ladies" could stand for — no wonder that they swayed the city, and carried the day with a high hand. For they paid twelve per cent. a month for money, and were ready to take all they could get at that price, offering securities in the goodwill and fixtures of one "saloon" or another, a house, a lease, a water-lot, a bank.

Moreover, the gambler of '49 was no vulgar villain of the sordid stripe; he had his aspirations; it was proud game he hunted, and he put his own life into the chase. The law being to play fair or die, and the finest distinctions of the *meum* and *tuum* being defined by the pistol, it is easy to understand that there were honest gamblers in San Francisco in '49; in fact, I will go so far as to assert that, as a class, no others were so strict and punctual in all their dealings. No investment was safer or more profitable than a loan to a gambler; no rightful claim was more easy of collection. Nor were these men, though most dangerous on certain points of professional prerogative, by any means habitually quarrelsome. On the contrary, they were often the peacemakers of a fierce crowd whose explosive passions were stirred, constituting themselves an extemporaneous vigilance committee, in the name of the law and order they had themselves set up for the occasion; and then woe to the refractory!

As I have elsewhere said, not uncommonly the professional faro-banker of '49 was a farmer-like and homespun man, with a kindly composition of features and expression, patriarchal in his manners, a man to go to for advice, abounding in instructive experiences of life, and full of benevolent leanings toward the world; a man to lounge about the porticos of hotels, reading his "Alta," or the latest home papers, projecting city improvements and public charities, discussing important enterprises, overhauling the business of the ayuntamiento, considering at large the state of the country, defining the duties of

OLD ADOBE, USED AS CUSTOM-HOUSE.

Congress toward California, portraying the future of the State; and then — starting out to make the round of the tables, and deliberately to set about “breaking the bank.” I have known such a man to take, in one day and night, five out of seven monte banks, besides a faro bank or two, seat his own dealers at them to keep the game going, and then subside into his pipe and newspaper, his political economy and projects of benevolence.

Of such was the fraternity that swayed the city in those days, and the secret of their paramount influence lay, partly, in their harmonious combination of the preëminently American traits—a faculty of taking accurately and at once the bearings of new and strange situations, fixity of purpose, persistence of endeavor, audacity of enterprise, ready hazard of life, ever fresh elasticity of sanguine temperament, but principally in the imposing figures of an omnipotent cash capital, wherewith they knew how to feed the enormous cravings of the people, and mitigate their privations and their pains.¹

The people eagerly accepted the treacherous comforts and solacements so seductively displayed on the green cloth; and gambling became the recreation of the honest toiler or trader, as well as the revel of the reckless buccaneer. While occupations were as various as the needs and makeshifts of those who had recourse to them, it may be said that in all that din and bustle and hurly-burly there was but one pursuit. Miners and boatmen, laborers, mechanics, and builders, merchants and clerks and peddlers, thimblerriggers and fakirs from the streets, lawyers, physicians, judges, clergymen—all alike found a rapture in faro or bluff, a distraction in roulette or rondo, an edifying experience in monte or rouge-et-noir. The bar and the green table went into partnership, and, with a joint stock of cards and chips, decanters, fiddles, and pictures, and reckless wo-

men, did a madly merry business. There were hundreds of such places where, in the evening and all night long, keen fellows, horribly quiet, shuffled the fateful cards with deadly deliberation, or where bedeviled women, horribly beautiful, greedy, and cruel, twirled roulette-wheels to the mockery of music.

The great “saloons” were on the Plaza: all of the east side and the greater part of the north and south sides were given up to them. In each of these from ten to a dozen tables waited for players—for the man whose “blood was up,” or the man who was bored, or the pleasant fellow who “might as well amuse himself.” The man whose blood was up usually began with a stake of a thousand dollars and ended with fifty cents, and lost it; and the pleasant fellow who would amuse himself usually began with fifty cents and ended with a thousand dollars, and lost it; while the bored man won and won, and “took no interest.” Piles of coin in gold and silver, bags of dust, and gold in nuggets, lay in the middle of the table; and the game went on in sweet repose and pensiveness, not even broken when the stakes were at their highest, and the spectators, standing three lines deep, waited for the luck of “that long-haired stranger who came to break the bank.”

“Everybody gambled”—that was the excuse for everybody else. The phenomenal exception was the man who, having lost his all at three-card monte on the head of a barrel in the Plaza, was thereupon seized with acute compunctions on moral grounds, and a luminous theory of the ratio of chances. “While profits and wages were so high, while there were no homes, no comfort or decency to be found in lofts and bunks, men thought to take refuge in riotous excess, seeking for rest and recreation

¹ J. W. Palmer, “The New and the Old.”

in gambling-hells, and bar-rooms, and dance-houses."¹ To find the few virtuous and worthy women of that time, you must have sought for them in tents and makeshift harbors, safely withdrawn from the public gaze, or else in the struggling beginnings of churches that feebly held their little forts against the banded forces of a multifarious godlessness.

From the upper corner on Washington street to the lower corner on Clay street, the people filed across the Plaza, between the Old Adobe and the Parker House, in an unending procession, or broke into motley groups of many colors and many tongues, and loitered by the flag-staff, among the trucks, and the oxen, and

that they had sown the wind to reap the whirlwind. The Chinese quarter in San Francisco became, it was charged, a hotbed of depravity and crime. The opium-habit spread among the white youth of both sexes, and fetid dens were open day and night."² The oath of a Chinaman became a joke in the courts, and it was proved that in the Chinese quarter rewards were covertly offered for the slaying of innocent witnesses. Thus anti-Chinese legislation, for the suppression of the Chinese highbinder, became a foregone conclusion.

But there are Chinese and Chinese; they are not all coolies and highbinders. In "Little China," as the district which includes Dupont

CORNER OF THE PLAZA, FEBRUARY, 1850.

the mules, the stalls of the small venders, and the handy boxes and barrels of the fakirs and thimbliggers, and the dealers of three-card monte; while from time to time some jingling ranchero, picturesque in serape, sombrero, and silver bell-buttons, and heeled with formidable spurs, would come caracoling across the square, making a circus of himself for the delectation of señora and madame. Always conspicuous among these was the ubiquitous Chinaman, "child-like and bland," but slyly twinkling with the conscious smartness of ways that are as hard to find out as the thimbligger's pea, which he so cunningly resembles.

There is record of two Chinese men and one woman who came to California on the bark *Eagle* from Hong-Kong in 1848. By February, 1850, these had been followed by 787 men and two women, and still they came. Beginning in the mines, they spread into the farms and gardens, and thence into workshops and factories, outbidding the Caucasian with longer hours of work and smaller pay. "Then the men who had given them employment, displacing the American and European workmen, soon found

street and the upper part of Sacramento street is called, were many respectable and wealthy Chinese merchants, men who trafficked in the goods and wares of their country, and were regarded by their Caucasian neighbors as shrewd, polite, and well informed, having consideration for their social caste, holding themselves aloof from the washermen and the porters, and, so far as the exigencies of their business permitted, living retired. In common fairness they were not to be reckoned with the keepers of gambling-dens, opium-joints, and brothels, but rather to be accepted as an honorable protest and appeal in the interest of that class of their people who are industrious, decent in their lives and manners, and of good report, who are contented, peaceable, and thrifty, and who hold it a point of honor that the Chinaman who cannot pay his debts must kill himself for the credit of the survivors.

Even in those days a sentiment of Sunday-ness might be found in the suburbs of San Francisco; and in an equestrian scamper to the Lagoon, the Presidio (the old Spanish cantonment), or the Mission San Dolores, one might

¹ *Annals of San Francisco.*

² San Francisco "Chronicle," September 7, 1890.

MISSION SAN DOLORES — SUNDAY AFTERNOON.

give his heart an airing. The Mission, so intimately associated with the early history of Yerba Buena and the later San Francisco, though it had been projected ever since the discovery of the bay in 1769, was not founded till 1776. The site was a small, fertile plain, embosomed among green hills, about two miles from the center of the present city. Several rivulets of clear, sweet water mixed their streams to form the larger Mission Creek. Further north were the bleak and sterile sand-hills on which the site of the present city was pitched; but the Presidio was more happily placed, and the small cove on the east, within the narrow entrance to the bay, afforded shelter and good anchorage.

The old Mission Church of 1850 was a spacious building of adobe, very plain without and partly whitewashed, except the front, which was relieved by certain crude architectural decorations, and showed several handsome bells. The interior was somber, grim, and cold. On the walls were rude paintings of saints and sacred subjects, and tinsel ornaments decorated the altar. But mass was still celebrated in the gloomy pile for the spiritual comfort of a small company of worshipers, mostly women of the Spanish races.

But the Mission was the favorite resort of holiday-makers from the city, especially of the Sunday revelers. Here bull-fights were held, and bear-baitings, and prize-fights of pugilists, and horse-races, and duels, and all the other mild diversions of the Forty-niner; and bars and gambling-tables supplied abundantly the indispensable refreshment and risk. Over the plank road, constructed in 1850, came an endless cavalcade of dashing equestrians of both sexes, and the highways extending southward to San José invited to pleasant excursions among green fields and hills.

But, after all, it was but a ghastly jollity, for under and all around it were destitution and disease, crime and despair and death. For the sick, the friendless, and the utterly broken there

were, for many months, no infirmary, no hospital fund, no city physician.

"Your honor, and gentlemen," said the eccentric Mr. Krafft, addressing an imaginary ayuntamiento, "we are very sick, and hungry, and helpless, and wretched. If somebody does not do something for us we shall die; and that will be bad, considering how far we have come, and how hard it was to get here, and how short a time we have been here, and that we have not had a fair chance. All we ask is a fair chance; and we say again, upon our honor, gentlemen, if somebody does not do something for us, we shall die, or we shall be setting fire to the town first, and cutting all our throats."¹

For these were the times when scurried men were landing from the ships, and men crippled with rheumatism, and wasted with dysentery, and delirious with pneumonia and typhoid fever, were taking refuge in the city, to find only the bare, wet earth for a bed, under a leaky tent, or a foul bunk in the loft of a shanty, where a man had never a chance to die like a man, because of the cruel, carousing crew in the den below; no doctor, no nurse, no balm, no wine or oil, no cup of cold water, no decent deathbed. And so we found their poor, cold, silent corpses in lonely tents apart, or in the bush, or under the lee of a pile of lumber in Sacramento or Montgomery street; and we dug a hole and buried them right there, and the city of San Francisco is their gravestone, and this story is their epitaph.

Here is a passage from the address of the alcalde, Colonel John W. Geary, to the ayuntamiento in August, 1849:

At this time we are without a dollar in the public treasury, and it is to be feared the city is greatly in debt. You have neither an office for your magistrate, nor any other public edifice. You are without a single police officer or watchman, and you have not the means of confining a prisoner for one hour; neither have you a place to shelter sick and unfortunate strangers who

¹ J. W. Palmer, "The New and the Old."

may be cast upon our shores, or to bury them when dead. Public improvements are unknown in San Francisco. In short, you are without a single requisite for the promotion of prosperity, for the protection of property, or for the maintenance of order.

Organized bands of ruffians, including thieves, burglars, and roughs, ever ready with knife and pistol, roamed unchallenged. Depredation and assault became familiar incidents

them fast bound with his "Thus saith the Lord your God!"

Most dangerous, and for a time most numerous, of the immigrant criminals who came to recruit the gangs of "Sydney-town" were the old convicts and ticket-of-leave men from Van Diemen's Land and New South Wales, who feared nothing but the gallows anywhere, and even that not at all in this land of devil-may-care, where prosecutors and witnesses were too

"HOUNDS" ATTACKING CHILIANS.

in the life of the town. The conflagrations which subsequently laid waste the most valuable districts were traced or ascribed to the handiwork of "Sydney coves" and "Hounds," who plundered under cover of the general confusion and dismay incident to a great fire. And everywhere was the reckless apathy of "every man for his own hand," every man a law to himself, and the six-shooter his only constable. Only on a Sunday afternoon, on the piazza of the Old Adobe, was the voice of the prophet heard in righteous rebuke and warning—the voice of brave old Father Taylor, lifted up in stentorian psalm and prayer, arresting the passing miner and gambler, the "Sydney cove" and the courtesan, and holding

busy to concern themselves with courts; where judges were ignorant, careless, or corrupt; where trials were too costly for a bankrupt city; and where a man might hide easily and utterly under an alias or an alibi, a pea-jacket or a serape, a smooth face or a ragged beard.

The quarter known as "Sydney-town," the "Five Points" and the "Seven Dials" of San Francisco, lay around Clark's Point, in Broadway and Pacific street. Here a policeman hardly dared to enter, night was made hideous with debauchery and assaults, and for a few ounces a fellow could be hired to kill a man or fire a house, and no questions asked. "Although hundreds of murders had been committed" by the desperate denizens of these and other

THE FIRST HOTEL AT SAN FRANCISCO.

quarters, "and many murderers had been arrested, not one had been hanged, either legally or at the hands of self-appointed executioners; and the very courts themselves had become a by-word."¹

But the very excesses and intolerable outrages of this state of things presently compelled their own stamping out by methods that were short and summary. On the 15th of July, 1849, a gang of young men who called themselves "Regulators," but were commonly known as "Hounds," and who were the "Mohawks" and "thugs" and "plug-uglies" of that time, proceeded to "take the town" after a fashion which they had made their own. This gang, which had been first heard of toward the close of 1848, began to make itself felt and feared in the spring of the following year. Under the pretense of mutual defense against the encroachments of foreigners, especially Chileans, Peruvians, and Mexicans, they had adopted a sort of military organization with a regular headquarters, which they called Tammany Hall, in a tent near the City Hotel. They paraded the town in broad daylight, with flag and fife and drum, armed with revolvers and bludgeons; and at night, when the streets were dark and unguarded, they often raided saloons and taverns, eating and drinking at the charge of the proprietors, and afterward making a wreck of stock and furniture in the very devilment of wantonness and fun.

Returning from a marauding excursion to the Contra Costa on the afternoon of Sunday, the 15th of July, they made the rounds of the town, equipped in fantastic toggery of ponchos

and Canton crape-shawls, pillaged from Spanish-American and Chinese shops; and in the evening they marched upon the tents of the Chileños, cuffing and kicking the women and children, and clubbing and shooting the men, tearing down the tents, destroying their scanty furniture, and plundering them of clothing and valuables.

The limit of that criminal apathy which had so long passed for patience was reached at last. On the 16th the community of "all good citizens" met on the Plaza in response to a proclamation of Alcalde Leavenworth, who had been urged to vigorous action by a committee of merchants and others. The meeting was organized with Mr. W. D. M. Howard as chairman and Dr. Fourgeaud as secretary. Sam Brannan addressed the multitude, and denounced the "Hounds," and the whole foul herd of criminals and miscreants, in unmeasured terms. A subscription was opened for the relief of those who had suffered by the outrages of the 15th; a volunteer police force was organized, consisting of 230 special constables, armed with muskets and revolvers, and commanded by Captain W. E. Spofford; and that same afternoon twenty of the "Hounds," including Sam Roberts, their leader, were captured and lodged on board the United States ship *Warren*. On Tuesday a grand jury of twenty-four citizens found a true bill against the prisoners, who were brought to trial on Wednesday before a jury specially impaneled. Sam Roberts and his mate, Saunders, were sentenced to ten years' imprisonment with hard labor, and the others to shorter terms with fines. But these penalties were never enforced. Several of the leaders were sent out of the country, the rest were set at liberty; and although the "Hounds" were muz-

¹ San Francisco "Chronicle," September 7, 1890.

zled, other criminals and desperados, more daring and dangerous than they, were encouraged to show a bold front and strike deadlier blows. The famous Vigilance Committee of 1851, with its swift and tragic executions, was the inevitable response to the general cry for retribution and protection.¹

The hotels of San Francisco may be regarded as the consummate product of that primitive system of coarse feeding-places which began in 1848 in the makeshifts of a mining-camp, and was developed in the growth of "saloons" and restaurants of every imaginable description: dining-rooms, chop-houses, cabarets, and fondas. There were cooks for every people and tribe under the sun — American, English, German, French, Italian, Chilean, Mexican, Chinese, Kanaka, Negro. There were beef and mutton from the ranches, fish from the bay and rivers, bear, elk, antelope, hare, squirrel, quail, duck, snipe, and plover from the inland hills and valleys, vegetables from the Pacific islands, and fruits from more distant ports. A hungry man might make a tolerable meal on beef at fifty cents, pork or mutton at seventy-five cents, a dozen canned oysters for a dollar, and a baked potato for half a dollar; or if his appetite was dainty and his pouch full, he might indulge in roast duck at five dollars, broiled quail at two dollars, and "top off" with sardines and *pâté de foie gras* regardless of expense.

Mr. Winn, the proprietor of the Fountain Head and Branch, arrived in San Francisco in 1849 without a dollar. He started business by making candy with his own hands, and peddling it about the streets on a tray slung from his shoulders by a pair of old suspenders. The San Francisco "Commercial Advertiser" of the 6th of April, 1854, notes that Mr. Winn "paid for ice and eggs last season (five months), \$28,000; for one month's advertising, \$1600; receipts at his two houses average \$57,000 a month; has paid \$200 a month for water; to one man in his employ, \$1000 a month and his board; has paid \$3000 for potatoes, and \$5000 for eggs, for the same time; and fed poor and hungry people at a daily cost to him of \$20."

The first of the San Francisco hosteleries, in point of time, was the old City Hotel, which was built of adobes in 1846 at the corner of Clay and Kearney streets, and, until after the discovery of gold, was the only notable public house. Then followed, in 1849 and the succeeding years, the Parker House, the Graham

House (afterward the City Hall), the St. Francis, the Union (destroyed in the fire of May 4, 1851), the Oriental, the Tehama, Wilson's Exchange, the Rasette House, and others.

The public amusements of San Francisco may be said to have begun at the old school-house on the Plaza on the evening of June 22, 1849, when Mr. Stephen C. Massett appeared in a sort of musical monologue, with recitations and imitations. The small room was filled, "front seats" being "reserved" for the four ladies who were present. The piano used on this occasion was loaned by Mr. Harrison, the collector of the port, and was said to be the only one in California; the charge for admission was \$3, and \$16 was the price paid for removing the piano from the custom-house to the school-house, half-way across the

THE FIRST SCHOOL-HOUSE, SAN FRANCISCO.

Plaza. In 1849 and 1850 there were equestrian and acrobatic performances in tents, — Rowe's and Foley's circuses, — and in January, 1850, the first dramatic performance was given in Washington Hall, "The Wife" and "Charles II." being indifferently played by a small company to a large audience. In April, 1850, a French vaudeville company appeared in a neat little house on Washington street near Montgomery, and, in September following, the original Jenny Lind Theater offered its attractions over the Parker House saloon on Kearney street. This house was destroyed in the fire of May, 1851. The large brick and stone building known as the New Jenny Lind, afterward the City Hall, was opened on the 4th of October, 1851, and the American Theater on Sansome street on the 20th.²

The school-house on the Plaza was appropriated as a place of public worship in October,

¹ See this magazine for November and December, 1891.

1848, the services being conducted by the Rev. Dwight Hunt, a missionary from the Sandwich Islands, who is remembered as the first Protestant clergyman in California. The little house was filled at every meeting, and on the first Sunday in January, 1849, the first Sacrament of the Lord's Supper was administered to twelve communicants of different denominations. That congregation was composed of people who were not hampered by sectarian prejudices, or concerned to cavil about creeds and forms. The steamship *California*, which arrived in February, brought four missionaries from New York—Messrs. Wheeler, Baptist, and Woodbridge, Douglass, and Willey, Presbyterians. On the 1st of April the steamer *Oregon* brought the Rev. Albert Williams, who, after preaching for a while in the school-house, on the 20th of May organized the first Protestant society in the new city,—the “First Presbyterian Church,”—which was started with six members. In this small but notable group were Sarah B. Gillespie of the Presbyterian Missionary Church at Macao, China, and Mr. Frederick J. Billings, of the First Congregational Church at Woodstock, Vermont. This gentleman, by the early and earnest part he took in the moral sanitation of the city, won for himself an honorable name in her annals as a conspicuous pioneer in all good works; he was associated with General Halleck in the practice of law. The place of worship of this brave little congregation was on Dupont street in a tent that had been the marquee of a military company in Boston. This temporary accommodation was superseded in the fall of 1850 by a church edifice, complete with pulpit, pews, lamps, and bells, which was brought out from New York and set up in Stockton street near Broadway; but five months later it was burned, in the great fire of June 2, 1851. Although this represented the first religious society organized in San Francisco, it was preceded as a church edifice by the “First Baptist Church,” on Washington street between Dupont and Stockton streets, erected to accommodate the congregation gathered by the Rev. O. C. Wheeler, who had arrived in the *California* in February, 1849. Then followed the “First Congregational Church,” organized in July, 1849; “Trinity Church” (Episcopalian), and Grace Chapel, under the mentorship of that devoted missionary, Dr. Vermehr, who, in February, 1854, resigned the principal charge to Bishop Kip.

The early Roman Catholic “Church of St. Patrick,” in Happy Valley, with its school and orphan-asylum, and those at the Mission San Dolores and in Vallejo street, were largely attended, and services were held in English, French, and Spanish. Jewish synagogues and

Buddhist temples have their place in the religious history of the city, which, beginning with the Mormon elder, Sam Brannan, became in time worthy of the ministrations of Bishops Alemany and Kip; and no man did more to pilot her skittish flock to nobler heights than that brave, pertinacious, and magnetic Methodist, William Taylor, whose church was the open Plaza, and his pulpit the porch of the Old Adobe.

On the 4th of January, 1849, the “*Californian*,” which in November, 1848, had been consolidated with the “*Star*,” changed its name to the “*Alta California*.” At first it appeared as a weekly, then three times a week, and finally it became the first daily paper in California. Then came in quick succession the “*Journal of Commerce*,” the “*Pacific News*,” and the “*Daily Herald*.” On the 1st of August appeared the “*Picayune*,” the fifth daily, but the first evening paper. These were followed by the “*Courier*,” the “*Chronicle*,” the “*Bulletin*,” and others, including German, French, Italian, Spanish, and even Chinese newspapers, all of them marked in a greater or less degree by the ability, enterprise, pluck, and vim which are the characteristics of the country.

In describing the familiar features which should appear in a picture of the San Francisco of those golden years, the auction is not to be forgotten—that last resort of the consignee or supercargo who could find no storage for his shipment, no ready purchaser at any price. There were neither wharves nor warehouses to accommodate the overflowing freights brought by incoming fleets of merchantmen. Lighterage from ship to shore cost four dollars a ton, and the monthly rate for storage was ten dollars a ton. Perishable goods were often a total loss; cargoes were, in some cases, reshipped to the Atlantic States without breaking bulk. Excessive and indiscriminate shipments could but result in wholesale waste and recklessness, and the only relief was to be found in auctions of a slap-dash kind, conducted by any man who might see fit to put up a sign near the water-front.

At first the principal landing-place was at Clark's Point, where the water was deep at the rocky shore; but by October, 1850, there were wharves of considerable length at Market, California, Sacramento, Clay, Washington, Jackson, and Pacific streets. The aggregate length of all the wharves exceeded six thousand feet, and the cost to that date amounted to a round million.

The famous clippers which had excited the admiration of the world of men who “go down to the sea in ships” by the beauty of their lines, their buoyant grace, and their capacity to carry great spreads of canvas, were racing against

time around Cape Horn, to land on the wharves of San Francisco cargoes for which there might be no market, but at rates of freight that nearly paid the cost of the ship in a single run. Those were the days of the *Gray Eagle* and the *Grayhound*, the *White Squall* and the *Flying Cloud*, the *Typhoon* and the *Trade Wind*, and the *Sovereign of the Seas*—true couriers and wild riders of the main, that made the very storms their servants.

On Telegraph Hill—on the very spot where in 1847 our citizen of Yerba Buena had stood

was made in not less than seven or eight days, "fares, \$30 cabin, \$20 deck, and \$5 extra for berths; meals on board, \$2." In 1855 a good boat could make the distance in half a day.

It is usual to speak of the conflagrations which from time to time laid waste the most populous and bustling parts of San Francisco as the "great fires," because any one of them sufficed to fill the measure of a citizen's conception of ruthless devastation and dismay. There were six of them, beginning with that of Christmas Eve, 1849. Then thin boards

A LODGING-HOUSE INTERIOR.

watching the incoming of the *Brooklyn* with her dispensation of Mormons—Messrs. Sweeny and Baugh erected early in 1849 a lookout, or observatory, which commanded the approach and entrance to the Golden Gate, and by means of a code of signals kept their patrons of the city informed of the approach of vessels of every class, from coasting craft to man-of-war. At a later day a station was established nearer the ocean, which transmitted earlier intelligence by signaling the inner telegraph-house.

Until the fall of 1849 small schooners and launches had afforded the only means of navigation across the bay and up the Sacramento and San Joaquin rivers; but in September a little iron steamer called the *Pioneer* began to ply the waters of the Sacramento, and was shortly followed by the *Mini*, the steam-propeller *McKim*, and the *Senator*. At first the run

and lath, and flimsy cotton cloth, and painted canvas, were licked up like tinder by the lapping tongues of flame. The fire began in Denison's Exchange, on the Plaza, in the early morning. That notable landmark of the Forty-niner, the Parker House, and all the buildings on Kearney street between Clay and Washington streets, were obliterated from the map of the city. It was the work of minutes, and the loss was a million. On May 4, 1850, the second great fire broke out on the site of the first, and swept away in its amazing rush and roar three entire blocks in the heart of the city. This time the loss was four millions. In the first conflagration it was the gamblers who had chiefly suffered; now it was the merchants. Six weeks later, on the 14th of June, when the wind was high, the entire district bounded by Clay and California streets, Kearney street and

FREDERICK J. BILLINGS.

the water's edge, was swept away, buildings and goods being almost totally consumed.

On the 4th of May, 1851, the anniversary of the second great fire, the city was desolated by a conflagration which is remembered as *the* great fire. It made a jest and mock of "fire-proof" buildings, and iron frames and doors and shutters curled up in the flames like card-board. It began late on the night of the 3d, in a store on the south side of the Plaza. The wind rose with the flames, and whirled them south and north; the streets beneath the planking became great flues; the whole business part of the city was a roaring furnace; and the reflection is said to have been visible in the sky at Monterey, a hundred miles away. Ten hours sufficed for the destruction of nearly two thousand houses; eighteen whole squares, with portions of five others, in the most important part of the city, were almost totally obliterated, and the loss was estimated at \$12,000,000. On what had been the streets, men said, "Well, the bay is here, and the people are here, and the placers are left!" And they went straightway to work and built a new city, richer, stronger, handsomer than before. Hittell says of these fires that they exercised an important influence upon the politics and trade of the city. "The fire of May, 1851, was attributed to incendiarism. The amount of property exposed in the streets was so great that the

citizens banded themselves into a committee of vigilance, which soon extended its jurisdiction and hanged murderers as well as protected property. Merchants put their goods into store-ships, and the harbor was filled with old hulks until 1854, when brick stores, really fire-proof, began to furnish room and safety on shore. Unable to make bricks or cut stone except at terrific cost, orders were sent abroad for incombustible building materials. Granite was brought from China or from Quincy, lava from Honolulu, and bricks from Sydney, London, and New York." Out of the ruin and wastes sprang new life, new forces, higher hopes, and nobler endeavors.

By 1852 the characteristics of a Spanish town had well-nigh disappeared from San Francisco. From Clark's Point to the Rincon, all had become American. The jingling ranchero, ostentatiously sombrero'd and bespurred, had been superseded by equipages familiar in the Eastern cities; omnibuses plied between the Plaza and the Mission; the "steam paddy" was busy in Happy Valley; and the sand-hills at the back of the town were being dumped into the water-lots in front. The city was moving bayward, and new streets were growing upon piles. "Where once floated ships of a thousand tons, now were great tenements of brick securely founded in the solid earth."

The sleepy little Yerba Buena of 1847 had become a metropolis of factories and great

stores, of schools and churches, of newspapers and theaters, of benevolent institutions and public works, of stage-coaches and mails, expresses and steamers; a city of brilliant bustle and magnificent dissipations. But a dollar was no longer paid for a pill, nor ten dollars for an ounce of carpet-tacks; for everybody was trying to sell, and everywhere was glut in spite of the ravenous extravagance and waste. Auctioneers tossed off ship-loads of merchandise for a song, and the enormous loss fell upon the foreign shippers; so "happy-go-lucky" was the temper of the hour, and a canter to the Presidio or the Mission, or a picnic excursion to the Contra Costa, was the usual diversion in the intervals of business.

In August, 1850, the Society of California Pioneers was called into being, mainly through the influence and efforts of Messrs. Howard, Brannan, Bryant, Wadsworth, Folsom, and others; and its first appearance as a civic organization, preceding all others in California, was in the public obsequies appointed to honor the memory of President Zachary Taylor, on the 29th of that month. The officers first

invested all his means in the sterile sand-lots of Yerba Buena, and waited for the coming of the great city he foresaw.

The records of that parent society were destroyed in the great fire of May, 1851, with the exception of one book containing the constitution and the signatures of a few members. The officers, who had been chosen to serve a twelve-month, were compelled by the exigencies of that memorable period of disaster, danger, and turmoil to hold their respective places for three years; but in the imposing demonstration by which the admission of California into the Union of States was celebrated on the 29th of October, 1850, the Society of Pioneers appeared in force, and made a conspicuous impression by their moral and intellectual prestige. On the 6th of July, 1853, the association, which owing to the local troubles had so long been unable to meet, was reorganized at the Oriental Hotel, when Mr. Brannan was elected president; Messrs. Larkin, Snyder, and Lippincott, vice-presidents; and William Tecumseh Sherman, treasurer. The society as at present constituted is a social and benevolent, as well as a historical, scientific, and

DENNISON'S EXCHANGE AND PARKER HOUSE, BEFORE THE FIRE OF DECEMBER, 1849.

elected were Messrs. Howard, president; Brannan and Snyder, vice-presidents; Bryant, Parker, Folsom, and Wadsworth, secretaries; and Talbot H. Green, treasurer. Among these associated pioneers Captain Folsom was a conspicuous figure. He came to California as a staff-officer in the quartermaster's department of Stevenson's regiment, and was eventually made chief of that department on the North Pacific coast. With notable foresight, long before the apparition of the golden wizard, he

literary association; and its objects are to collect and preserve information relating to the early settlement and subsequent history of the country, and "in all appropriate matters to advance the interests and perpetuate the memory of those whose sagacity and enterprise induced them to settle in the wilderness and become the founders of a new State."

most interesting association are to be found the names of Generals Sherman, Rosecrans, Wool, Frémont, Halleck, Schofield, Sutter, and Vallejo, and the Revs. Henry W. Bellows and Thomas Starr King.

Originally it was a condition of membership that the applicant should have arrived in California prior to the 1st of January, 1850; but the constitution has since been amended so as to admit the sons of pioneers.

John Williamson Palmer.

REFFEY.

By the author of "A Common Story," etc.

I.

DAVE LEWIS ran passenger-train No. 14 over the range one day, and brought back passenger No. 3 the next. No. 14 dined at Topaz and suppered at Mitcham's, as they said on the road; No. 3 reversed the arrangement.

Lewis was required to report his train from Mitcham's, where he knew the manager of the eating-house and the telegraph-operator. Both were young women.

For the last two months ReffeY Deacon had not been sending in meals to the telegraph-operator when she was busy. For the same length of time Mattie Baker had forgotten to send ReffeY's provision order to Denver until the next day. ReffeY used the post now, and Mattie came to the hotel dining-room for her meals, like anybody else. Lewis had jilted one girl for the sake of the other.

The two lived alone at Mitcham's; other than the servants, they were the only inmates of the house and the entire population of the town, which began and ended at the eating-station. Their nearest neighbors lived ten miles away on a ranch up among the hills behind the hotel. The front windows of the hotel looked out on a cliff. It was a thousand feet high, and ReffeY and Mattie did not see the sun in the mornings until it shone vertically down into their nest. The eating-station, which was also a hotel, had been placed at the exit from Red Rock Cañon, as being the only spot within thirty miles large enough to accommodate it. The floor of the valley—lying between the cañon wall on one side and the hills that climbed, beyond the river, toward a rugged grazing country on the other—was not above two hundred yards in width; the structure which the railway company had erected on this grudging space was an oblong frame building two stories high, painted a railroad gray, and containing only ten practicable bedrooms, in addition to the big dining-room, the refreshment-room, and the ticket-office and telegraph-office, occupying the ground floor. But in the cañon, through which the railroad had stolen a perilous way, there was room for nothing larger than the huts of flagmen or track-walkers; and these structures

were likely to hang out over the river, propped at the fringe of the ledge along which the track wriggled and balanced. In summer parties of fishermen came to whip the Red Rock River, the stream that boiled and shouted through the cañon, and rooted night and day at the base of the rock on which the hotel was built. Holiday parties from the East, railroad-men in special cars, and English tourists, armed with expensive guns, also came at certain times, and spent a week or two at Mitcham's, troubling the echoes among the hills. But at other seasons the two women lived alone. The situation demanded an amiable relation between them, and was intolerable without it.

Dave and ReffeY were to be married as soon as he could build her a proper house at Maverick. ReffeY (the name represented her mother's fantastic shortening of Rebecca) had her own ideas regarding a fit residence, and was in process of imposing them upon Dave and upon his builder. Lewis was now "knocking down" more fares than before his engagement to ReffeY: instalments on the house were coming due; he was beginning to look at furniture; and ReffeY was in other ways an expensive young lady. Her standard of the presents to be expected from a lover in Dave's position was high.

The drummers, who had dared one another for a month to try it on with Lewis when he had first been promoted from the ticket-office at Denver, smiled at one another now when they met, and they winked at Lewis. Lewis, on these occasions, fixed his eye intently on the ticket in the hands of the passenger in the next seat, keeping the responsive wink for the baggage-car, the upper corner of the smoker, and the refreshment-counter at way-stations, where he came by cigars and drinks easily. Drummers who had once, long ago, stayed over a train or spent an extra night in a town rather than travel by his train now exchanged jokes with him on the purity of his first month's work on the road. The atmosphere was easy-going and friendly on Dave Lewis's train now that they all knew him for one of the boys, and the men who had lost money by betting during that first month that he had been put on the road by the company to spot the crooked work of other conductors now made him stand treat.

Dave asked them what they had taken him for, and they asked him how he expected them to "tumble" all at once to the fact that he was

one of themselves when he came straight from the Denver ticket-office. They quoted the other conductors as having shared their idea, and they wanted to know why he had kept them so long in suspense.

"Why, boys, to tell the truth, I was the young and blushing maiden of that situation. I had to wait until I was asked."

"The drooping violet of Maverick, that's what you were—the shy little Denver daisy. Remember the cigars and talky-talk I wasted on you before I got up sand to offer you three dollars for a five-dollar fare? One-seventy-five is all you get out of me these days, you old fraud. We've got to make you sweat somewhere for that shrinking violet business—eh, boys? Well, here's my regards!"

Einstein, whose line was cloaks and trimmings, blew the foam off his beer and drank to Dave.

These regular patrons of the road forgave themselves slowly for their obtuseness; but since the suspicion had been lifted from Lewis they made it a point of honor to treat him as if it had never been. Now that they had proved his innocence, there was not a more popular conductor on the road. It was true that he was not thought exclusive enough since his engagement to ReffeY. He now distributed his favors over a wider area, and almost any traveler who was a little "fly" could make a deal with him. It was a poor system for the company, but it worked well for ReffeY; and if Dave ever had any doubts about it from a moral point of view, they were more than solaced in her society. The company charged passengers too much and paid him too little, so that whichever way he looked at it he was a remedial agent. This was probably the dumb reasoning with which he satisfied his conscience; but, on the whole, it would be easier to say how a murderer excuses his crime than how a man sophisticates such stealings. The one point clear to Dave was that they were *not* stealings. Certainly he never called them so, and since no one else did, since even the company had no word for practices of this nature and no remedy for them but dismissal, and since cases like his never got into the courts, nor even, oddly enough, into the newspapers, he was at liberty to create his own moral world. In this world he and his wants were easily chief, and the railway—from which everything you got was so much clear gain, and even clear righteousness, yet, conveniently, too, a disembodied, soulless, dividend-paying corporation, which nothing could injure—was easily last.

ReffeY had not been able to help letting Dave see from the first that she cared for him. It had begun on the day she arrived from Topeka, where she had acted as head waitress of

a hotel, to take charge of the eating-house at Mitcham's; and it may have been her evident preference for him which first flattered him into treason to Mattie. But his passion for her had not long needed a better reason than her own charms; once within the immediate range of them, her beauty inflamed him and he was snared by the strange, gipsyish, baleful witchery of a temperament scarcely more different from Mattie's than from his own. Her imperious, ardent loveliness ruled and fascinated him; Mattie's housekeeperly order of spirit and blessed calm of mind had merely cradled him.

He found the excitement of being engaged to ReffeY a strain at times on a slow, mild disposition the actual need of which was a peaceful harbor; but, save when his conscience accused him for his faithlessness to Mattie's simple trust, he was aboundingly happy in the change. The characteristic quality of his feeling for ReffeY was a huge admiration, and if he had been a woman, and she a man, he would have crawled at her feet; as it was, he let her worship him. But he continued to admire her. After a month's engagement she remained wonderful and inscrutable to him; entirely apart from his love, he could n't help feeling that he had made an astonishing bargain. Whatever else might happen, she was sure to remain the only person off her own piece of goods; and it was from this point of view, rather than out of the usual lover's feeling of his unworthiness, that he tried to live up to her. Every act of his life was penetrated with the thought of her, and none more than his daily reckoning up of his accounts with the company.

He was accustomed at the end of the day to find his way to the last seat in the smoker, which was likely to be vacant, and to pour out upon it the contents of his pockets, consisting of the tickets and money gathered from passengers on the trip. After counting and noting the tickets for his report, he told over the money for what he called a "division of the spoils." In these divisions, to which only one of the beneficiaries was a party, the company "got what was right"—that is, a little more than the least it was likely to accept without grumbling. But delicate questions often arose: there was not always enough to go around; the point of safety was not definite, nor was it invariable. It was n't even ascertainable, for yesterday's return might have aroused suspicion, while, on the contrary, it might have been so large as to form the germs of habit in the company's mind. The business had its good and its bad days, like another: when "commercial" travel was large, and Dave encountered other friends besides his drummers, the day was a success; if to this was added, by chance, a considerable flock of

passengers who had forgotten to buy their tickets, and who paid the full fare in the simplicity of their hearts (he gave them a duplex ticket, of course, but all contributions helped the exchequer), Dave remarked mellowly to himself that it was "a good day for ducks." If it had been possible to keep trade up to a really high standard, Dave would have become shortly a railway king, by methods not widely dissimilar from those generally recognized; but with all its faults it remained a lucrative business.

He liked best to divide with the company when he was making the western run, as every moment, in this case, brought him nearer to the object of these divisions, and to the object of all that he did. On these days he would usually begin his reckoning at the eastern end of the cañon, that he might know when he saw her what he had been able to do for her that day, even though he could n't speak of it to her.

He celebrated an unusually good day by treating himself to the best cigar that had been given him on the trip, lolling back on the front seat of the smoker, and making pictures of the smoke during the long run through the cañon, in which no stations occurred to disturb him. After a thirty-dollar day he usually put another story on the house, in these reveries, bought the big Persian rug which he had envied at Daniel & Fisher's in Denver, laid it on the parlor floor, seated Reffeý in a deep wicker-chair on top of it, made the dull, rich red of the rug harmonize with the bronze red of her complexion, and with the flush of happiness on her cheek, caused her eye to rove from the rug to the furniture (red plush to match the rug—lots of gold on the chair legs), and from the furniture to the bright blaze he lighted on the hearth (their hearth!), and from the hearth to himself. The look of gratitude and love she gave him made his head swim in his vision, and, not to stint himself, he closed the scene by making her give him a royal hug of her own accord, just as the whistle sounded for Mitcham's—and down at the end of the cañon Reffeý was taking her place behind the lunch-counter.

On the days when Dave brought No. 14 over the range from the east, Reffeý went about her usual occupations with an attent ear. Long before the train came in sight on the bridge by which it crossed the river two hundred yards from the hotel, a whistle rolled down to her out of the heart of the cañon, multiplied in howling echoes. The whistle went to her heart, and, wherever she was, her dining-room girls would see her pause in her quick, commanding movements, arrested like a listening deer. Then she would go on proudly, giving the last neat touches to the dining-room tables, over which a hungry riot was immediately to sweep. A girl who had giggled in her palm

one day when the whistle blew had shrunk away, scorched by a dozen words from Reffeý, and had left Mitcham's that night, with her trunk, on the up-mixed-freight.

No. 14 stopped twenty minutes at Mitcham's, and the greater part of the passengers for this reason preferred a regular supper in the hotel dining-room to the chances of the lunch-counter. It was therefore from behind this comparatively unfrequented counter that Reffeý usually directed her smile of greeting at Dave. The counter was of marble, and the triangular slices of pie were on their plates, the beans waited under their covers, and the ham sandwiches reared their pile of masonry.

She had spent a nervous half-hour behind this counter one warm spring afternoon, waiting for the whistle,—she could n't, of course, ask Mattie how late the train was,—when the resounding blast always given under arrangement by Dave's engineer leaped on her ear. As the echoes began to roll back on themselves into the cañon she gave a last polishing rub to the glass bell protecting her jelly-cake, trimmed the spirit-lamp under her monster coffee-urn, and put up a hand to the bunch of green bananas over her head to stop it twirling. Then she leaned over the counter, on her elbows, between the sandwiches and the cake, to nod happily to Dave, as his train rolled up to the solitary eating-house and he followed his passengers in.

In this attitude he restrained himself with difficulty from giving her a real hug—she looked so splendidly, satisfyingly beautiful to him. As a matter of fact, Reffeý was unmistakably handsome in her large, arc-lamp fashion. She had uncommonly brilliant and beautiful eyes, passionate, liquid, beguiling, and shinningly resolute. Her face was not delicate, but it was strong with the same glow one saw in her eyes—a glow slightly crude, and perhaps more than slightly vicious, but richly alive. As she leaned over the counter her black, fluffy hair seemed nearer her heavy eyebrows than usual, her forehead looked lower, and her broad shoulders and abundant figure lost none of their value. She had a square, man's chin, and decided, compressed lips. She was carefully dressed, as was usual with her, in a figured cambric, without the apron worn by her dining-room girls.

She threw a smile at him, and began at the same time to attend rapidly and capably to the orders humbly suggested to her by the dozen passengers who had chosen the lunch-counter in preference to the dining-room. Dave threw a leg over the last stool in the row before the counter, and waited, with his elbows on the marble, for her to hand him the tenderloin steak and fried potatoes she was accustomed to keep for him. The steak came up through the dumb-

waiter in a moment, smoking hot, and their hands met under the plate as she set it down before him.

"What's Henry McKelway come up on the 7 for?"

"To take my train to Portoe's Junction," returned Dave, with a smile. "It's a change-off I fixed up with him. Any objection?"

She looked up from the plate and pretended to examine the idea disinterestedly.

"Just as livs," she said, as she swept a bewildering smile over her adorer, who shivered where he sat with a sensation of pure joy.

She turned from him to snatch a bottle of St. Louis lager from a shelf high above her head. Dave wanted to vault over the counter, pull it down for her, and take her about the waist in just this attitude. Instead, he watched her, as she stood on tiptoe, swing her arm up to it with the sureness and grace of all her movements, and deposit it before him, after whirling it once in the air under the counter and catching it by the neck, with a laughing glance at him. Then, without another look in his direction, she moved away to attend to other customers, only returning to ask, as he finished his steak and his lager.

"Want some pie—mince, apple, blackberry, blueberry, pumpkin, custard?" She radiated love at him through her waitress manner; and Dave, giving back her look, dreamed into forgetfulness of pie, until she called herself back with a sharp "Well?"

"Ain't you got none of my patent brand?"

"Not allowed. Bad for the complexion."

"It ain't hurt yours any as I notice."

"Just you mind your own complexion, Dave Lewis."

"I use Madame Necker's Frozen Balm night and morning. What do you want? Say, gimme some of that lemon meringue pie, now, you, and be quick about it."

She remained staring imperturbably at him through her lustrous, laughing eyes.

Dave knotted his fingers under the hand she spread out on the counter. "Come," he said worshipingly, "get a move on, will you?"

She popped her head under the counter, and drew forth the double slice of thick lemon pie that she had been keeping for him.

"There, Greedy!" she said affectionately, under her breath, as she slid it toward him over the marble with the twist she used for customers.

When the train had gone on in charge of McKelway, and Reffeý had straightened up her lunch-counter, she put on a sun-hat and followed Dave along the track toward the bridge over the river. The hat was large and daringly trimmed, but it became her exceedingly, and during the first minutes of their walk she

used all the advantage it gave her over his stunned admiration.

She stepped from tie to tie with a long, free, swinging step, taking two ties at a time, while Dave contented himself with one. Mattie, watching them from the window of her telegraph-office, told herself sadly that they were a fine couple, and Reffeý, glancing at Dave as they walked, said to herself that he *was* handsome. Dave was straight and well made; his face had the regular beauty, his black hair the fetching curl, his fine eyes the appealing, tender, conquering light which women love. He had, moreover, the gallant carriage of a calling in which, more than in almost any vocation of peace, except that of a sea-captain, a man gains the habit of command and of responsibility. His train was always going on or stopping at his word, in Reffeý's thought of him; when he was away from her she pictured him with an authoritative hand in the air, waving his train forward or back, or, with a despotic lantern, flashing upon the engineer orders that might kill or save a hundred souls. She found no difficulty in reconciling his careful habit of dress to this conception of a heroic calling; that touched the social side of his work, which demanded that a man should n't look like a fright in taking up tickets from ladies and gentlemen. She liked his little air of correctness, the black clothes, which made him singular among men engaged in ordinary affairs and even a little singular among his fellow conductors, the heavy gold watch-chain, the accurate, flat black bow which he wore under his celluloid collar at an angle not intended to conceal the rhinestone collar-button above it; above all, she liked his crisp, jaunty, almost rakish mustache.

Reffeý, who often took the airs of a good-natured czarina with him, now made him account to her for every minute that had passed since they had last met; and in return, with the charming condescension of the president's wife talking to a master mechanic, gave him the news of the road, of which she often knew more than he by reason of her favorable post of observation. Every brakeman, conductor, engineer, and fireman on the Topaz division passed her eating-house regularly, and as all trains stopped, and as the trainmen were intimately dependent on her good nature for the quality of their meals, her shrewd eye and ear had their opportunities. She made the men talk, listening, watching, and deducing pitilessly. Her judgments were harsh; she did not believe in people. It was perhaps for this reason that she believed with such abandonment in Dave, with a kind of prostration and abasement, with a total and unreckoning gift of a nature wildly proud.

To both of them the road was a world; they thought of its hundreds of miles as having a local existence, and all their speech recognized the people who officered and worked it as the population of a single community. Both knew every person employed by the railroad, his history, his present situation, and his prospects, as if he had been their fellow townsman. They did not always sleep in the same place, this town population, but they all slept sometimes in the same place, and, going or coming, they all took the same meal at the same time and place every day. The unity of the life, like the unity of a regiment's life, was its real quality; its scattered and diversified air was its superficial aspect.

She told him, now, that they were to have three new "moguls" and a couple of new "hogs" on her division, and asked him in a detached way if he was likely to be affected by the change in the boundary of the division at present ending at Maverick. Engineer Demarz had been transferred from engine 210 to 403, as one of the consequences of the change; Cockleman was running 210 now, and Vigart was firing for him. William Masten, Mark Kites, and Fred Decker were to be the "hostlers" at Maverick. The roundhouse foreman at Portoe's Junction was to be married next week. How did Dave like Hammet to get ahead of him like that? Had he met the California horse-special that went through yesterday to take the trotters on to the Eastern race-meetings? The smelter at Rexiana had shut down, and the road was n't hauling any more ore there; the coal-field at Cannel was sending through thirty cart-loads a day, though. The boys said there was to be a new time-table out in a fortnight; but she did n't believe it would affect him, anyway.

"Look out there!" shouted Dave, as she stepped out gaily on the railroad bridge. "Let me go first."

The river which ran through the cañon took its course here through a deep gorge a hundred feet below the level of the track. The bridge spanning it was of wood, and a single plank was laid loosely over the ties, between the rails, for the use of track-walkers. The crossing of the bridge by this plank was a dizzying business, requiring experience and a cool head. Reffeey, who had been brought up in a prairie country, had never seen such a bridge until two months before, and she had been accustomed to let Dave go ahead and to give her a guiding or supporting hand where she needed it. But she was in a mood to-day to make him wince under her power, and perversely, at the same time, in a mood of humbleness and frankness which made her wish to show herself to him as she really was.

"Pooh!" she cried, looking back at him

over her shoulder, as she balanced on the plank above the gorge, in a way that turned Dave pale. "Think because you run trains over this bridge you've got to run me over too? I'm the conductor of this train."

She moved out a dozen steps further, taking care how she put down her foot, as indeed she must, but giving an effect of recklessness to her motions that made Dave sick with fear. He started to follow her out upon the plank, but she screamed peremptorily:

"Stay where you are till I say you may come. Don't you move, Dave Lewis!"

"You're mad, Reffeey! You're mad! Wait till I can get to you." He made another movement to set forth toward her, but she shouted:

"If you take another step before I tell you, I'll go out on the ties."

She made as if to suit the action to the word, and Dave's tongue hung limp in his mouth as he managed to cry back hoarsely, "All right; I won't."

He stood regarding her slow, balancing motions with horror. He had advanced some paces on the plank himself, and when he let his eyes drop he saw the river gleaming between the ties, a hundred feet beneath. Out there, under the spot where Reffeey stood, the stream tossed and whitened over a scattered mass of rocks. She was not looking down; her head was up, her arms out, her eyes straight before her, and she was feeling for the plank with her feet. His heart melted in his breast as he gazed after her.

Suddenly he saw her stoop as she passed the water-barrel placed on wooden bridges as a precaution against fire. She crept out upon the platform on which the barrel stood, and, gathering her skirts under her, sat down at the edge of it, dangling her feet above the river. Then she looked around at him calmly, and called out:

"You can come now."

Dave drew a long breath, and ran out toward her on the plank. Long use had made the feat easy to him, and he was quickly at her side.

"Well, I'll be ——!" he said, standing above her.

She looked about at him with a challenging smile.

"Don't be. It's more fun out here."

"You're a wicked girl."

"Yes; I know that," she answered, contemplating the toe of her boot, as she swung it out over the abyss. "Did I worry you?" she asked.

"You killed me. I would n't go through what you just made me go through, again, for a thousand dollars."

"Well, I won't charge you that. Won't you be seated?"

She mimicked the parlor manner in a nim-

ini-pimini voice, and drew in her skirts to give him room on the platform. He sank down beside her, and seized her hand fast in his.

"Promise never to do it again," he demanded huskily in her ear.

She gave a little squeal of pain.

"Le' go my hand!"

"Promise."

She looked into his eyes. "All right, Dave; I promise."

"And you 'll never do it again?"

"Never. Not the same thing. I'm tired of that."

He gave her a look of deep reproach, before which she lowered her eyes.

"O Dave," she murmured, as she cuddled her head on his breast, "I *am* wicked! You don't figure enough on that. It was partly to show you how wicked I am that I did it."

The need for a faith on his part answering to her utter faith in him caused her, at times, to test his belief in her wilfully. She had told him scores of things about herself, in the fear that he would find them out and cease to believe in her; she was accustomed to heap up the tale of her proud, passionate, selfish, jealous nature, in the nervous longing to make sure of his love once for all by exhausting in advance the possibilities of accusation.

They sat silent for a moment after this, while Dave took her to him, and they kissed in a long, reconciling embrace.

"You don't know me, Dave Lewis," she said, "and I don't suppose you ever will till I make you hate me by doing something that 'll hurt you so bad that you 'll never have anything more to do with me. It 'll be something I can't help doing; and I 'll love you all the same,—oh, yes, I 'll love you fast enough,—but I 'll have to do it. And then I 'll spend the rest of my life wishing I had n't. I've got a regular black heart, Dave, that 's what I have; and the sooner you know it the better."

Dave laughed easily. "I always take mine black," he said.

She patted his hand as she looked up at him. "Well, I only hope you always will."

"I know what you're thinking of," he said.

She enveloped him in the sultry atmosphere of one of her rich glances. "I 'll bet you don't," she answered, with her head up.

"You're thinking of Mattie; you're thinking we did n't do right by her. I often think that myself."

"Do you, Dave Lewis! That little, meek, chalk-faced hussy! Well, then, I don't. Do you hear that? I don't. I hate her, I do. Understand? I hate her. I'd like to take a dozen men from her, one after the other, and toss her their old hats for keepsakes. I'd like to have her out here where we're sitting—that 's all."

"Great Scott, Reffe! You ought to want to be good to her. We've done her harm enough. Anyway, I have. If I knew a thing to do for her that would n't hurt her worse 'n leaving her alone, I'd do it *too* quick."

"Look here, Dave Lewis, if you want to go back to her, you've got an easy chance. Just take that plank and march back to the hotel. You 'll find her in the telegraph-office, and glad to see you, I should n't wonder."

"I ain't hankering to go back to her," he said sulkily.

"Well, then!" ejaculated Reffe, decisively.

"You don't expect a man to play a trick like that on a woman, and *like* it, I hope."

"Don't I, though? Depends a little on who he plays it on, and who he does it for, I should say. If it were some girls I know and some men, I should think they'd just go wallowing around in it. I only wish it had been my chance to give her the mitten. I'd have worked some prickles into it."

"What a girl you are!" exclaimed Dave. He said it admiringly, though he had intended to say it upbraidingly.

"Well, I told you I was n't good. I ain't. I better tell you the kind of girl I am, I guess. You know I come from Topeka, but you don't know how I come to be there, nor what it was that drove me into the business. I ain't an eating-house manager by profession. My father—my own father—kept a store in Kansas City. He used to speculate in land. We was rich once, like other people. But the bottom dropped out of land in Kansas City, my father died, and my mother married again. My new father lived at Wichita. He had more education than my own father, but less brains. First we did n't like each other, and then we hated each other like mad; but I used to work for him like as if I'd loved him. I got up every morning at four o'clock to get his breakfast and send him off to his machine-shop (mother was n't much good those days), and he was always rowing me about my cooking. The cooking was all right, if I do say it. That was n't the trouble. He 's one of these kind of men that 'd find fault with the Garden of Eden if the sun was under a cloud, and the next day 'd be praising Sunday-school picnic lemonade. You *could* n't please him. Well, one morning I was frying some bacon for him in the kitchen, because he'd said the day before that if there was one thing he did like it was bacon, and I never give it to him. He came out into the kitchen, where I was heating myself up over the stove for him, and first he did n't like bacon, never eat it, and never would eat it; and then he began to criticize around about the way I was frying it. That got my blood up, but I did n't say nothing. Then he went sniffing at it, and

bending over to look at it close, and telling me to turn it this way and that, and showing me how he wanted it cooked, till I was ready to fly out of my skin. And I *told* him. Says I, 'Look here, you *know* I've got a notorious temper. I ain't got no control of myself if you rouse me. Just take warning now, Jim Phelan, (that 's what I always called him), or it 'll be the worse for you.'

"He just smiled at me, and went on, and then I up with the whole boiling skillet of fat and grease and let him have it. It took him full in the face, and he dropped into a chair as if he 'd been shot, howling with the pain like a wild animal, and I just looked at him and asked him, 'Well, how do you like it?' I did n't have no more bacon to cook, and I could give my entire attention to him. He shrieked for a doctor (mother was n't to home that day), and I smiled at him. Then he knelt down on the kitchen floor, with that grease dripping all down his face and out of his beard (you don't know how funny he looked), and regularly prayed me to do something for him. But I told him I was n't running for doctors so much this week as I was last, and it did me good all through. Well, then I ran away, of course, and went to Topeka, and got a place as dining-room girl. After six months or so they found I could run girls, and they made me head waitress. You just see what I am, Dave. I ain't good. I love my friends and hate my enemies; and when it comes into my head to do a thing I do it, and if I'm mad I'll do anything. Sometimes I don't think a girl like me is going to bring you happiness, Dave. But then I remember how I love you, and after that I think of some one else having you, and—" She bit her white little teeth together. "Well, about that time I'm willing to make you miserable."

Dave refused the prospect of wretchedness she offered him, of course, and denied her capacity to furnish it. He said she was his life, his happiness, and his only hope; and said it, as they sat on their dizzy perch, with a thousand circumstances of endearment. The narrow mountain torrent chafed against its walls down there at the bottom of the gorge, further beneath them than Reffeý really liked to make sure of with her eyes. It tormented itself upon the rocks with moans and eery cries; it split and bubbled in showers of spray; and raced on to a crashing death over the fall in sight from the bridge. The crags rose on each side of their resting-place into pinnacles that hid the sun and made an early twilight in the cañon.

II.

MEANWHILE Mattie sat in her little telegraph- and ticket-office, "visiting" with Kate

Farley, the operator at Red Rock, the station at the other end of the cañon. They held conversations like this over the wire daily, during slack hours after the day's markets had been sent through, and when the line was not much in use for commercial work. Their acquaintance had begun with an inquiry from Kate about the geraniums in Mattie's window. She telegraphed her that her "steady," Milton Drew (who had just been promoted from his position as fireman of 192 to that of engineer of 308), had noticed them blooming in her window on his journeys back and forth, and had twitted her on the poor show hers made beside those in the office at Mitcham's. Kate wanted to know how Mattie made hers grow, and Mattie, who was the most good-natured person possible, had told her. They knew all about each other's affairs now, and were bosom friends, though they had never met.

They even described their offices to each other: and Kate knew that Mattie had her walls papered with cuttings from copies of "The Illustrated London News," left by one of the English visitors to the hotel (Kate's walls were covered with fashion-plates); that there was a rag carpet on the floor, a "busy bee" clock on the shelf, a bearskin under Mattie's feet, and by her side a window-box covered with a piece from one of her mother's trousseau dresses. She also knew that her chief possession was a dog, an Irish setter, which she kept constantly by her. Kate pictured the little room as the neat, quiet, domestic spot it was; and rightly imagined it as like Mattie.

It was to Kate, as her nearest friend, that Mattie had first told the news of her engagement to Dave; and Kate had telegraphed back a hug, and a rattle of applause not in the Morse alphabet. Then she had fired questions at Mattie, who had ticked back her answers with shy jerkiness. She told her friend that Dave was the best and dearest fellow in the world, and Kate had shown her teeth from Red Rock, and laughed back that she supposed as much. Kate made Mattie give her daily news of the progress of the affair after this; it superseded their geraniums as a theme of conversation, and Mattie bore Kate's electrical digs and gibes without attempting retaliation in kind. Kate was n't at all shy about Milt, which made all the difference; and indeed Mattie liked the subject of Dave too well to grudge the expense of teasing for the right to talk him over. They talked almost as much of clothes as of Dave, for Mattie was doing in the office her own sewing for the wedding, and she could ask Kate's advice at the end of any seam by reaching out her hand. When the trains came in she put her telltale needlework carefully away, wrapped (with her dreams) in the fair linen cloth she

kept for the purpose, stood up in her little box, raised the rolling front of her ticket-rack, slid up the window separating her from the prose of the outer world, and was a woman of affairs again.

She stamped tickets with a business-like bang of her little fist, and rattled off train-messages, and received orders and reports, as if nothing of the Dave kind or of the love kind existed on the planet. When the train was Dave's, and he leaned over her counter to sign his name in the train-book, a perception of facts of this order certainly got into her eyes; but this was all she allowed herself in business hours. On Dave's day off, when he came over from Portoe's Junction, he loafed about her office, watching her movements affectionately while she attended to her duties, and made plans with her, when she was not busy, for the time after their marriage. When No. 3 had passed (Dave's train every other day), Mattie's time became her own, and it was their custom to take long evening walks in the cañon or among the hills. On the nights when their walks led them into the black and awful beauty of the cañon, Mattie liked Dave to pilot her over the bridge, though her mountain-bred step was surer than his railway-man's nimbleness. The moon, rising late for wayfarers in depths a thousand feet below the world that saw its first beams, would often discover a pair of lovers, far down in that rocky dimness, whispering to each other. These were sweet evenings to Mattie, and, until Reffeey came, they were not less dear to Dave.

When he threw her over she seemed at first like one mortally stricken. Afterward she roused herself and went on, in order rightly to hate Reffeey. It was the woman who had taken him from her whom she blamed, of course; Dave could never have turned false if she had left him his senses. She had bewitched him, and the fault was no more his than if a serpent had fixed a fatal eye on him. The deep forces of a still, temperate nature were alive in Mattie now; she had not the habit of valuing herself, nor of regarding herself as entitled to things, and she had almost no aggression, but Reffeey had roused a tiger in her. She daily found new ways of hating her and new reasons for hating her. Reffeey's assured and familiar air with Dave, as if it were to her that he had been long engaged, the easy impudence with which she had accomplished her theft, even the perception that Reffeey would have borne the hurt much better if it had fallen to her lot, sharpened her rancor. She fancied, with gnashing teeth, how cleverly Reffeey would have made a triumph of being jilted, so that every one would think it precisely what she had all along been desiring; she saw Reffeey showing herself

gaily the next day at an engineers' ball or at a firemen's excursion with a defying face and a rollicking smile for the boys; and Mattie loathed herself for not being strong enough for this, though she had no heart to answer back, so far as Dave was concerned, nor any real wish to shine with this impossible address. Toward Dave no pride, nor savageness of stolidity, nor mere concealment, nor any other maidenly defense, came to her aid; the wound he had dealt remained open and palpable to him. If he looked her way he could not fail to see his work, and perhaps this touched him more than any hardness could have done.

She suffered to herself; her mother was long dead, Mitcham's was her only home, and, unless she excepted Kate, she had no friends. The difficulty of telling Kate was finally the cruellest measure of his cruelty; for a week she continued to answer questions about her dresses, and even about him, with a breaking heart. She simply had not the courage to tell her; and when she brought herself to it at last, Kate wired back furiously that she was n't "sending" decently; how did she expect her to "take" from such work, especially when what she seemed to be trying to tell her was so interesting? Then certain male operators on the line who made daily bets with one another on the "game," and who wanted to talk over the drubbing Chicago had given New York (they had not let them get a run), cut in to ask if those girls were going to gabble *all* day; and Mattie gave it up.

Mattie watched Dave hanging on Reffeey's words as he had been used to hang on hers, gazing into her eyes with the fond smile that had once belonged to her alone, using the thousand little tricks of affection that had once seemed invented for her (poor fool!) and consecrated to her; and she saw Reffeey bloom under these stolen blessings. It was hard to see them together, but much harder when she did not see them, and her fancy was left to gnaw bitterly upon itself. Their walks in the cañon or among the hills brought tortures with them that seemed, each time, to leave a permanent mark on her spirit. To-day, from her window, she had watched them leave the hotel arm in arm, then separate, and step from tie to tie, disappearing in the direction of the bridge. She knew from the wires that a "special" was on its way over the range, bearing certain Eastern railway officials in their private car; and she knew that Dave and Reffeey did not know it, and supposed the last train to have passed until the hour when the evening express was due. She followed them with gleaming eyes; it was n't her business to tell them. Dave was able to look after his new lady-love for himself, she supposed. They might meet the train in a part of

the cañon where there was room, like as not; and if it came around a curve before they knew, or caught them on the bridge, they'd enjoy dying in each other's arms. It was n't her lookout. They did n't ask advice from her about their walks; they had n't invited her to follow them.

"Three's a crowd!" whispered Mattie to herself, pressing her face against the pane.

She would be a murderer. What? Sitting in her office, looking out of the window? That was a good joke.

But she would.

"Who's doing anything?" muttered Mattie to the window.

Kissing and spooning, they were having a good time in there, between the cañon walls. Better not interrupt them.

The thought of Dave came over her smotheringly; she gasped. It was not her Dave, nor Reffey's Dave—merely Dave. She loved him. She could not let him die like that. She threw a shawl over her head, and laid a hand on the knob of the office door. Then she stopped. Could she save them for each other? Could she bear to see them happy later, and know it to be through her? If they died together—they would n't; it was crazy to think that a railroad-man and a clever fellow like Dave would n't have more hustle about him than that; but if they did, it blotted out her trouble, it stopped the pain in her breast. She need n't turn the knob. Her hold relaxed. The grim thought that followed made her tighten it again; she turned the knob, and went out and down the track. What had come to her was that Dave would *not* be happy with Reffey,—no, never in this world,—and that if she wanted her revenge on both of them, she would save them to marry each other. When she came to the bridge and saw them seated there in the affectionate attitude already described, she halted, and had almost turned back; but her thought came to her again, and she called out sullenly from the edge of the gorge:

"Better come off there!"

They looked up at the sound, and together saw the little figure on the bank of the river—a small, pale face framed in a tightly drawn shawl, which fell down the straight lines of an almost tiny form. Her dog was standing by her side.

They recognized her together, and Reffey gave a shrill laugh. Dave laid a hand on her arm for silence.

"What's the matter?" he called back to Mattie.

"Special!"

"The devil! Get up, Reffey!"

"Don't I look like it?"

"You look like a madwoman. Do you want to be killed out here?"

Reffey made her rosy mouth into a pout. "I don't want to be saved—not by her," she said, swinging her legs.

"Good heavens! What *do* you want?"

"This suits me pretty well," she said, glancing up at him with a tantalizing smile.

"Come! no fooling. There's a train coming, I tell you."

"Well, get out of the way of it, then."

"Do you suppose I'm going without you?" No answer.

"Look here, Reffey Deacon, get up off there and come along with me, or I'll carry you."

"I would n't do that," she responded quietly.

"Why not?" asked Dave, stupefied.

"I'll jump."

Dave uttered a raging oath, and looked about him helplessly.

"Well, say what you *do* want me to do, then, and say it quick."

"Get out of the way of the train, I tell you, if it's coming. Go over to your friend there. I'll take care of myself."

"You'll be killed."

Reffey pushed out her lower lip quickly, and dropped her eyes.

Dave laid a hand on her shoulder; she looked around at him.

"If I go, will you save yourself?"

"That's *just* what I'll do," she said, pursing her lips and nodding her head. "I don't have to ask Mattie Baker to do it for me." And, after a pause, "Nor you either, Dave Lewis, when she sets you on."

"Well, I'll be —!" began her lover.

She turned and nodded to him. "Good-by!"

"Oh, good-by!" shouted Dave, turning on his heel and going swiftly toward Mattie.

At the same moment Reffey got deliberately upon her feet, slipped out to the central plank, holding on by the barrel, and, turning her back upon him and upon Mattie, began a progress to the other bank best described as a saunter.

In building the bridge and making the curve in the track, on the bank opposite that on which Mattie stood, a deep hollow had been excavated in the face of the rock. Reffey had noted it from her seat above the river. She stepped off the bridge and tucked herself into it as the special roared by her, darted out upon the bridge, and swept by Dave and Mattie, on the other side. The wind it made caught her dress as she crouched back in her shelter, and blew it tight about her. She held her big hat on with one hand, and looked across the chasm to see the negro porter waving a greeting to her from the rear platform of the last car, and to catch sight of Dave standing on the oppo-

site bank talking earnestly to Mattie, who was turning away.

He was thanking her with embarrassment, or trying to say how they could never thank her enough. If ReffeY could have heard him including her in the obligation, she would not have remained under the shadow of the rock until they parted.

Mattie was saying, with lowered eyes, "I guess you don't want to be very thankful to me, Mr. Lewis, and I guess I don't want to have you."

"Of course. You hate me. I know that. It's only natural."

Mattie shook her head, and rubbed the gravel backward and forward with her foot. "No, Mr. Lewis; I don't hate you."

"Well, then, it's because you're too good. I've given you cause enough, heaven knows. Mattie, I've been wanting this long time to tell you—only, somehow, I never got the chance—that I don't think any more of myself than you do; not a bit. I had to; I was n't responsible. I can say that; and it's the best I *can* say. But it don't excuse me any."

"There ain't any need for excuses as I know of," responded Mattie, with dignity.

"Well, then, there ought to be. If a woman had treated me the way I've treated you, I would n't think *excuses* was in it—much! You're a first-class, nickel-plated angel, Mattie; that's what you are!"

Mattie shut one lip upon the other. "I guess I rather get what praise I *do* get somewhere else, Mr. Lewis," she said quietly.

"All right. But I'll never get over what I done to you, Mattie. I want you should know that—never! If it's any comfort, you can know that what I did ain't always such a comfort as it might be."

Mattie looked up, with a spark in her eye. "You mean—*her*?"

"Well, I was thinking how it hurt me all the time to remember about you."

"You need n't," interposed Mattie, for very shame, though the pretense of a hardihood in which she knew he could n't believe (how could he, when he knew her, when he had made her tell him a thousand times how she loved him?) did not give her the smallest pleasure.

"But perhaps it ain't so far from true of the other, either," Dave pursued thoughtfully. He had not even heard her protest.

Mattie drew her shawl together as if to leave him. She looked into his eyes a moment.

"You ain't going to be happy, Dave."

"You mean I ought n't to be after what I've done?"

"I mean you ain't going to be," repeated Mattie, doggedly; and with this she turned and left him.

Next morning she received, through the usual channel, a communication from Kate, and when ReffeY knocked at the window of her ticket-office, in the course of the morning, Mattie raised it and met her with a new look in her eyes.

"The less we have to say to each other the better," ReffeY began from outside, as soon as the window was raised; "but I just came to say you need n't do that again. I'd rather stay and take my chances with the cow-catcher twenty times over."

Mattie surveyed her for a moment, and they exchanged glances of cold repugnance.

"I ain't very likely to," said Mattie at last, measuring ReffeY scornfully.

The manager of the eating-house was looking offensively well—tall, commanding, buxom, rich-colored, satisfied, prosperous. Mattie looked out at her from the other side of the window, conscious of her own pinched face, haggard with weeping and with wakeful nights, and a burning throb of jealousy went through her. All that fairness, and health, and well-being seemed stolen from her, too, as her lover had been stolen. A frenzy of loathing seized her, and the news that had saddened her half an hour before rejoiced her now with the hope of bruising that haughty happiness with it.

"Well, see you don't, that's all," rejoined ReffeY. "I can get along, I guess, without being beholden to *you* for my life, and so can Dave. Oh, I know what you did it for."

"I did n't do it for you."

"You did n't get the chance. I was ready for you."

"Nor for him, either," continued Mattie, without raising her voice.

"What then, please?" demanded ReffeY, briskly.

"I did n't want either of you to get killed," pursued Mattie, steadily. "I wanted you to live."

"*Did* you!"

"To marry each other," Mattie went on quietly. "You're going to marry a thief; did you know that?"

ReffeY blew an amused, derisive sound between her lips, glancing carelessly down at Mattie from her superior height.

"Yes; you're going to marry a thief. Heaven won't let such things be as you've done and nothing to pay. Be sure of that, Rebecca Deacon. You've swindled me out of Dave, but you can't swindle the powers above. Your house is being built with stolen money."

ReffeY's face went quickly to a ghastly pallor. "Who says it? Who dares?"

"I do. Do you want any one worse to know it than me? I guess I enjoy it as much as most

any one would. You did n't rob me of such a prize, *after all*, did you, Miss Deacon?"

Reffey's face grew whiter, and then an unwholesome dusky blue. Rage choked her. She thrust her arms quickly through the ticket-window, seized Mattie by her narrow little shoulders, and shook her viciously.

"Aw, you——" she stammered, breathless with passion. "You——" But she could not piece another word to it.

Mattie wriggled out of her strong grasp, and retreated against the corrugated black-walnut roller of her ticket-rack.

"That 's all right," she said, gasping, but still quietly; "but he 's knocking down fares every day, all the same, and you 'll live in a house that 's built with them."

Reffey leaned through the window with blazing eyes, and hurled these words at her:

"Don't think it! Hear? *Don't—you—think—it!* You're a liar, Mattie Baker; but if you were n't, and lived in hopes of *that* sweet sight to comfort your sore eyes, you'd be the most almightily left little girl between here and Salt Lake. *I'm* on in this scene. See! *I'm* right here, and that ain't my sort. Cast off!" she ended between her teeth, in an indescribable fury of scorn and malice. Then she went.

III.

Six weeks later Reffey and Dave were married. She had not questioned him; not only because she would n't do Mattie so much honor, but because she did n't believe it, and if she did, Dave was too clever to be found out, so that it would n't be true, anyway. As to whether Dave was actually a thief or not she cared practically nothing; and besides, what he was doing, *if* he was doing it, which he was n't, was not thieving. It was—well, it was "knocking down," which was nothing out of the way unless discovered. *Then* it was stealing fast enough; but she did n't take herself for fool enough to be in love with a man who would do such a thing, *and* be found out. Hardly.

They were married in the dining-room at Mitcham's by a clergyman whom Dave dead-headed over from Portoe's Junction. All the dining-room girls were there, and the new eating-house manager, who had been transferred from Maverick to take Reffey's place; so were all the men on Dave's division who could get off. Reffey looked as beautiful and sumptuous and perfect in her bridal dress as Dave could have wished or fancied, and he quieted the accusing pang of memory, as he looked about him and saw that Mattie was n't there, with his deep satisfaction in the situation as it stood. He beamed on all his friends, in fact, as became a bridegroom, and no one who looked at his

cheerful face could have supposed that a corner of his breast was given over to a heavy and dispiriting remorse. Mattie's words mixed themselves hideously with the words of the marriage service. "You ain't going to be happy, Dave," the clergyman seemed to be saying. Dave was uncertain in the responses.

The "collation" which Reffey had prepared with her own hands kept them, with other festival matters, until No. 3 stood at their door, like a bridal chariot, waiting to speed them over to Maverick. They had the compartment in the Pullman to themselves, of course; and it was one of the brakemen who got on the roof, while the crowd was shouting farewells on the eating-house platform, and shied rice at them through the ventilator.

They were not going to take a wedding journey, unless the trip over the range to Maverick could count for that. Dave could n't well get off for a long enough time to make it worth while.

Jake Riker, the station hackman whom Dave had been accustomed to employ for his hasty conferences with his builder, was waiting for them on the platform at Maverick by Dave's orders. The newly made husband gave the order to drive to the house he had prepared for Reffey with a nervous twitch in his voice; he was taking his wife home,—the word sent a pleasant tingle through him,—but would she like what he had done for her? He knew by this time Reffey's capacity for not liking things. Suppose she should n't like this? Suppose it should all prove useless, the affectionate planning, the solicitous overseeing, the choosing and buying, and thought and work? As they were whirled along toward the house, and Reffey's hand lay moist in his, hours stolen from sleep to get half a day at Maverick for a talk with his builder, and weary days at Denver with furniture-men and carpet-dealers and paper-hangers, and the prospect of a disappointment for Reffey at the end of it all, disheartened him. If she would only like it, how little he should grudge his pains. The notion of "surprising" her with it all, which had possessed so rich an interest for him, now seemed silly. It was only by reminding himself that, in any event, she could n't have left her work at Mitcham's long enough to advise at Maverick or Denver that he got up the cheerfulness to leap from the carriage when they drew up before the house, to throw open the front door for her, and then, as she came up the walk to him, to lift her over the threshold with a bouncing swing, and to welcome her, within, gaily.

She gave him his kiss when the hack had driven away, the door was shut behind them, and they stood in their little parlor, alone with

each other. It was a fierce, devouring kiss, claiming him and making him hers, and hers only, for all and forever. She clutched him to her tight, possessing him with a savage tenderness; she put back his head to gaze into his eyes; her own swam in a soft languor. Then she rumbled his hair over his forehead, making inarticulate murmurs of love; she kissed him again once, twice, and then very many times.

"O darling, darling, dear darling, I love you!" she whispered. "Did you know that? I love you."

Dave caught her to him rapturously, and then held her away and let his eyes feed long on her brilliant, ardent beauty. The adoring face, in which she let him read for the first time all her love, was dizzying, blinding. He snatched his gaze from it.

"You have n't looked at the room yet," he said.

"Have n't I?" she returned dreamily, cradling herself in his arms.

"No."

"Well?" cooed she, contentedly.

"Oh, well, there 's plenty of time."

"Lots. Only think, we 're going to live here."

"Yes; together."

"Together!" she murmured.

A long pause fell.

"Well, I suppose I may as well," she said at last, with a deep sigh.

"What?"

"See what you 've been doing for me, you old goose." She gave his cheek a playful cuff, and turned to survey the room, taking off her bonnet, as she did so, and laying it on the sofa. Dave watched her in pain and doubt.

"O Dave!" she exclaimed.

"Yes. What?" he rejoined anxiously.

"You *dear!* You Jim Dandy! You out-and-outer!"

He laughed in uneasy relief. "I did as well as I knew how, without you."

She heaved a deep breath. "W-e-l-l!" she said, spreading the monosyllable out to the thinness of ecstasy, "it 's my size!"

Dave trembled with happiness, and he let her kiss him in stupid unresponse.

She darted away from him to the couch she saw over his shoulder.

"So you went and got the white and gold and thin legs after all?"

"Yes."

She stamped her foot on the red Persian rug, letting her shoe sink confirmatorily into its thick pile. "And this?" Dave nodded. She gave a little shiver of luxury as she cast an inclusive glance round the room, and said, "If you ask *me*, Dave Lewis, I believe you 've bought all the things you told me you could n't afford."

Dave laughed. "Should n't wonder."

"Well, you 're a beaut' from Lovelyville, David, and I don't care who knows it."

"Better see the rest of the house before you make too sure. Come on up-stairs."

He lighted the huge parlor lamp, with its duplex burner and immense red shade, and she followed him. There were plenty of smaller lamps in the house, but he had a fancy that some of the things he had bought would look best through red, and, at all events, he wanted to show her the lamp at once. It had an immediate success with her; she praised it all the way up-stairs, where, however, further examples of her husband's lavishness and taste won away her applause. She went about hanging on his arm and patting it softly, with whispers of delight and gurgles of gratitude and pleasure, as he held the lamp aloft in his other hand, flashing it into rooms which they presently visited, illuminating corners and closets, and turning it on objects which he had bought expressly in the hope that she would like them. She always liked them, she liked everything, and Dave, his fears put to shame, was ready to break his red shade in embracing her.

Returned to the ground floor, he ushered her into the dining-room, which she greeted with a shout of approval.

She tossed her chin teasingly at him. "Laid yourself out on that buffet, did n't you?" It was a monstrous black-walnut structure, over which thick varnished bunches of machine carving were plastered; the top was of an ugly red marble; the woodwork terminated above the mirror in a point, on which a seedy angel pirouetted.

Dave grinned serenely. He had got beyond the articulate expressions of gratification. Reffeey went up to the imposing piece of furniture and drew her hand reverently over the marble. After a moment she stooped to look at herself in the mirror, smoothing her hair.

"Well, I 've served things from buffets like that," she exclaimed, "and I 've worked for people that owned them; but I never thought to have one for my very own."

She opened the doors below the marble, and peered in at the shelves; she espied the silver and dragged it out and sprawled it on the table, rummaging it over lovingly. "Roll plate!" she said under her breath, "twelve table, two dozen tea, and—yes, a dozen desert. Oh, I 've always wanted dessert!" She sprang on him, and gave him such a hug as he would never have dared to picture in his reveries.

"Well," she said meditatively, as she pushed him off to regard him properly, "you *have* done it!"

"I don't know as I've spared money," said Dave, modestly.

She looked fondly at him. "You've spent it through a hose, David. Come into the kitchen."

The kitchen also seemed good to her, better, if possible, than the things that had gone before. It appealed to her on the professional side; she saw opportunities in the shining rows of fresh tins, the blue enameled ware, the pots and pans. She turned them over skilfully, and sounded them with her knuckles, and lifted a lid from the cooking-stove, and sniffed at the sink. Then she took his arm and drew him into the parlor, and made him sit in the wicker chair before the fire, where he had always planted her in fancy, and, for herself, dropped on the floor, and leaned an arm on his knee, while she looked up at him in a rapture of content.

The fire of piñon logs blazing in the grate cast a ruddy glow upon her face, out of which the sinister lines seemed for the moment purified. She took a newspaper from the table, in idleness, and glanced up and down its columns with the indulgent glance women give newspapers. It was a copy of the *Maverick "Sentinel."*

"Have you subscribed, Dave?"

"Yes; I thought it 'u'd make us feel sort of homelike to find a paper in the house, as if we'd always lived here."

"You sweetums! You've thought of everything. I wonder if every girl is so lucky." She mused a moment, as her eyes returned to the paper. "They've got a railroad column, have n't they?" she commented, pointing to a series of items headed "Track and Round-House Cinders," and surmounted by a cut of a locomotive.

"Yes; that's the advantage of living at the end of the division. We'll get all the news."

"That's the kind," said Reffeý, approvingly. "Why, here's your name!" She started up. "But *Dave*—!"

"Well? They got a grind on me about the ceremony? Preacher, county clerk, and furnished house for two? I supposed as much."

Something in her averted face startled him. "Why, what's the matter, Reffeý?" He forced her to turn toward him, and she faced him with a gaze of reproach and bitterness that searched his soul. He snatched up the paper and read for himself:

Dave Lewis, the popular conductor of Nos. 3 and 14, has got the grand bounce from headquarters, we understand. Moving cause, the good old custom of "knocking down." As he has just led to the altar Miss Reffeý Deacon of Mitcham's, well and favorably known as the manager of the railroad eating-house at that place, the g. b. comes at a bad time for the happy pair. O *Dave!*

He looked up and encountered Reffeý's hard eye still fixed on him.

"Don't look that way, Reffeý. What's the dif? They all do it."

"I know that," answered she, hoarsely; "but the rest don't get found out!"

He turned from her accusing and scornful gaze. "I suppose you're afraid I can't get another situation. You need n't be. I've got a place offered me on another road; I've had it this long time. I'll take that."

"Oh, I ain't worrying about you none. Don't you fret. Where's my bonnet?" She turned and found it on the sofa, where she had left it, and clapped it on her head, adjusting it with a vigorous movement, and jamming in the long pins in her haste as she could.

"Where are you going?"

"Out of this house."

"Don't be a fool!"

"Well, I'm going to try hard not to be, Dave Lewis." She gave him a quick look.

"You coming?"

"Did n't know as I was invited," he responded, with a ghastly effort at gaiety.

"Well, you are. 'T ain't *you* I'm running away from."

He dropped the paper, and stared at her.

"What then?"

"This house."

"*What!*"

"That's what I said," returned Reffeý, coldly, drawing her wrap over her shoulders.

"Why?"

She shut her lips. "Mattie Baker."

"See here, Reffeý Lewis, are you a rip-roaring maniac, or a sensible woman and my wife?"

Reffeý came and stood before him, with blazing eyes.

"Do you think I could live an hour in a house that Mattie Baker could say was built with knock-downs?"

The ferocious pride and malignity of her tone beat him down. He could not lay his tongue to a word.

"How do I know?" he said at last, sulkily.

"Well, then, put on your hat."

"Now look here—" he began with renewed anger, as he found himself.

"Don't I tell you I can hear her saying it? I ain't responsible for myself just about now, I give you notice, Dave Lewis. Come on!"

He restrained an inclination to clasp his hands about her fair throat and draw them tighter till she begged for mercy.

"What kind of woman are you, anyway?" he cried in rage as she gathered the strings within her cloak and caught them about her waist, where she tied them with a vicious jerk.

"The kind that don't take a man from another woman and then give her the chance to

say she's better off without him than I am with him. The kind that don't give any living mortal a whip over her. The kind that 'u'd kill herself with a smile before she give it to Mattie Baker. The sort that hates, if you want to know."

She was drawing on her gloves rapidly. Dave regarded her in helpless admiration and fascination as she gave vent to this astounding outburst. She *was* the only one off her piece of goods!

"I know that, Reffe; I know it," he said soothingly. "But you ain't going to leave our house on our wedding night — the house I've built and furnished for you, the house I've worked so to please you with. You don't know what it's cost me — the work and the money! *Our* house, Reffe! *Ours*, however it come! *Ours*! That sounds pretty good to me; I don't know how it does to you."

He stooped over her shoulder and tried to kiss her, but she pushed him off.

"*Ours*! Not much it ain't! A house that any one can point at and nudge the person with him, and smile, and say, 'Pretty tidy house that. Know how it was built, I suppose?' A house that Mattie Baker 'll know *that's* happening to every day! *Ours*! It's hers, I tell you — *hers*! I don't belong to her to pity, though — not yet! Come along if you're coming!"

She strode from the room, and Dave could only follow her. She waited at the gate while he locked the door; then they walked on together in silence toward the railroad from which they had come an hour before. A full moon shone down on them out of the fathomless, steely blue of these altitudes, blanching the snowy hills behind them to the whiteness of light. It was midnight, and the radiance fell upon a silent town, expressing its raw, haphazard outlines with a bareness and cruelty beyond the cruelty of daylight. The moonshine turned molten on the tin roofs, which grew upon the eye in the similitude of floating vessels of silver. The stillness was broken suddenly by a crash of brass instruments, which cleared itself in a moment into the strains of "He's gone and he's married Yum-Yum"; the sound came from the outskirts of the town. Dave guessed that "The Independent Maverick Brass Band — Sons of Veterans" was on its way to serenade them at the house they had just quitted.

Reffe; was pushing hurriedly on with a long, nervous stride; her face was absorbed and white; she had not heard the band. He was about to call her attention to it, when she turned suddenly upon him.

"Lemme have your key. I've forgotten something."

Her voice was harder than before; but deep down in it he thought he detected a sob. Perhaps she was relenting.

"Lemme take it," she repeated nervously. He handed it to her. "Wait here," she said, and went quickly back to the house.

She put the key into the door, and pushed into the parlor. The fire was still burning brightly in the grate. With the tongs she snatched it out upon the floor — one log and then another, until they lay scattered flaming on the Persian rug. The pile was thick; the rug did not catch instantly. She went to the window, tore down the lace curtains hanging there, and fed them to the flame. Seeing the "Sentinel" still lying on the table, she added it. Then the pile leaped up.

At the door she paused for a last look at the dear room — fresh, lovely, habitable a moment before, now melting into flames before her eyes. She made an instinctive motion forward as if to stop it, then checked herself proudly, and, without another look behind her, locked the door, and walked back to rejoin Dave.

She gave him the key. "Better go to the hotel, had n't we?"

He looked at her curiously. "Yes; I suppose so."

They went on in silence. As they reached the railroad platform, where the hotel stood, Dave looked up, perceiving the light in the sky that was not the light of the moon. He wheeled about and gazed behind him.

"Good God, Reffe! What's that?" He clutched her arm.

"The house."

"What? How do you know? Who — who did it?" the poor fellow stammered.

"I did," she answered coldly.

He turned a pale, staring, sick face upon her.

"*You!*"

"Hm, hum!" nodded Reffe; comfortably.

A cold feeling tightened about his heart. The vision of a long life with the woman beside him seemed to stretch away and away into a hopeless blackness.

He gazed at the mounting flame that was swallowing up his work, his love, his happiness, his honesty. The town was alive now; the shouts came to him, the gong on the hurrying engine seemed sounding on his soul.

"'You ain't going to be happy, Dave,'" he said to himself softly.

"What?"

"Nothing."

Wolcott Balestier.

ENCELADUS.

I SHALL arise ; I am not weak ; I feel
A strength within me worthy of the gods—
A strength that will not pass in utter moans.

Ten million years I have lain thus, supine,
Prostrate beneath the gleaming mountain-
peaks,

And the slow centuries have heard me groan
In passing, and not one has pitied me ;
Yea, the strong gods have seen me writhe be-
neath

This mighty horror fixed upon my chest,
And have not eased me of a moment's pain.

Oh, I will rise again, I will shake off
This terror that outweighs the wrath of Jove!
Lo, prone in darkness I have gathered hope
From the great waters walking speaking by.
These unto me give mercy, thus foreshown:

"We are the servants of a mightier lord
Than Jupiter, who hath imprisoned thee;
We go forth at his bidding, laying bare
The sea's great floor and all the sheer abyssms
That drop beneath the idle fathoms of man,
And shape the corner-stones, and lay thereon
The mighty base of unborn continents.
The old earth, when it hath fulfilled his will,
Is laid to rest, and mightier earths arise,
And fuller life, and liker unto God,
Fills the new races struggling on the globe.

"Profoundest change succeeds each boding
calm,

And mighty order from the deep breaks up
In all her parts, and only night remains
With all her stars that minister to God,
Who sits sublimely shaping as he wills,
Creating always." These things do they speak.
"The mountain-peaks, that watch among the
stars,

Bow down their heads and go like monks at dusk
To mournful cloisters of the under-world;
And then, long silence, while blind Chaos' self

Beats round the poles with wings of cloudy
storm."

These things and more the waters say to me,
How this old earth shall change, and its life
pass,

And be renewed from fathomless within;
How other forms, and likelier to God,
Shall walk on earth and wing the peaks of
cloud;

How holier men and maids, with comelier
shapes,

In that far time, when he hath wrought his
plan,

Shall the new globe inherit, and like us
Love, hope, and live, with bodies formed of
ours—

Out of our dust again made animate.

These things to me; yet still his curse remains,
His burden presses on me. God! thou God
Who wast before the dawn, give ear to me!
Thou wilt some day shake down like sifted dust
This monstrous burden Jove hath laid on me,
When the stars ripen like ripe fruit in heaven,
And the earth crumbles plunging to the void
With all its shrieking peoples. Let it fall!
Let it be sown as ashes underneath
The base of all the continents to be
Forever, if so rent I shall be freed!

Shall I not wait? Shall I despair now Hope
On the horizon spreads her dawn-white wings?
Ah, sometimes now I feel earth moved within
Through all its massive frame, and know his
hand

Again doth labor shaping out his plan.
Oh, I shall have all patience, trust, and calm,
Foreknowing that the centuries shall bring,
On their broad wings, release from this deep
hell,

And that I shall have life yet upon earth,
Yet draw the morning sunlight in my breath,
And meet the living races face to face.

Charles J. O'Malley.

ITALIAN OLD MASTERS.

TITIAN (TIZIANO VECELLI), 1477-1576.

HE visitor to the little village of Cadore, lying just off the great Roman road from Aquileia to Germany, finds it full of testimonies of its having been the birthplace of the greatest of colorists. His statue in bronze stands in the public square, and a little cottage near by is charged with a tablet inscribed with the information—of doubtful accuracy—that it is the house in which the painter was born.

Cadore is not a pictorial country, in the sense of furnishing subjects for the landscapist, but it has here and there strong motives and in parts is very wild; and no doubt when the boy came to live in Venice, with its islands moored on the almost tideless sea, the land stretching in every direction but seaward as far as the eye can reach, and almost as level as the sea itself, he longed for his mountains. His frequent returns to these native mountains in later life must have intensified the impressions of his boyhood to a strength which they would never have obtained had he remained among them. He did not find his color there, for the landscape is extremely monotonous in color; but he kept the feeling of the mountain-land,—its aiguilles, and its vigorous light and shade,—and besides being a great colorist, which he owed to Venice, he became a great landscape-painter at a time when such a thing was unknown. The Tuscan and Umbrian backgrounds serve only to make you feel that you are out of doors, that the blue sky is overhead, and the pleasant earth underfoot; the clouds stand for nothing, and the hills have no function but to break the monotony of the composition; the trees are mere symbols, and the nearest view of nature that we get is a bit of plant-drawing in the foreground; but Titian has the spirit of the hills, and he loves the anatomy of the trees as much as that of the human beings. He was nine or ten when he went to Venice to live, not, so far as we know, with any intention on the part of his noble father of making a painter of him, but, according to Vasari, to be with his uncle, "an honored citizen of Venice," who, finding that he had a disposition to become a painter, put him to study with Giovanni Bellini. Speculation has been wasted on his relation with other masters, and has gone so far as to make him the pupil of his comrade, Giorgione; but the art of the Bellini—it is im-

possible to separate the effect of the teaching of the brothers—accounts for Titian as well as for Giorgione. Vasari makes a statement of very great significance in relation to the art of Venice, the importance of which has not been recognized because it has not been generally understood how much the schools of central Italy depended on tradition and convention. He says:

Giovanni Bellini and the other painters of Venice, having no knowledge of early art, were accustomed to work altogether from life, though in a dry and severe manner. Titian therefore was educated in this way.

As there is here an intelligent distinction between the work of men who had inherited the precepts of a line of painters extending from Giotto to Perugino, and that of those who had only three generations of artistic predecessors, and those not of high ability, and therefore had been compelled to lean more on nature, it is impossible not to admit that the observation of Vasari was well made, and that the Venetians did study nature severely, but that the Tuscans did not. But when Vasari goes on to say that Giorgione, and Titian after him, followed the practice of painting directly, and without the preparatory drawing or cartoon, he can be correct only so far as decorative work was concerned, such as that which called out the remark, on the façade of the Fondaco de' Tedeschi; for in this class of work the correctness of drawing was of minor importance, while the vividness of the color throughout the composition was all-important. But the work of Titian, as well as that of the painters of the central schools, is full of evidence that they did not paint directly from nature, but from a carefully prepared study, probably in monochrome; and in the case of portraits the system of Titian, and possibly of the school of Venice in general, seems to have been to get the likeness in monochrome and then to put in the color according to a system as settled as that of the Tuscans, but utterly different as to technic. That the neglect of the previous preparation of cartoons was not the rule in Titian's work is clear from various data which chance has given us. When working with assistants in fresco, the work on the wall must have been left to them, and the only part the master could take was that of the preparation

THE ENTOMBMENT, BY TITIAN.

ENGRAVED BY T. COLE, FROM THE PAINTING IN THE LOUVRE, PARIS.

of the design for tracing on the wall. The use of oils led, no doubt, to a much greater latitude in the preliminary operations, and permitted the painter to complete his design directly on the canvas in the modern manner, and the absence of cartoons of Titian's work makes this plausible to a certain extent; but that this was a rule it is impossible to believe, for the general absence of changes in the composition of a work during progress—changes which can always be more or less easily discovered in the finished picture—indicates that the subject was put on the canvas in its final form. This definiteness of preparation in compositions of such complexity would have been impossible without a cartoon. And the fact that we have no more evidence of the practice of Bellini of making a cartoon, which he must have done while working in tempera, makes the argument of little weight in reference to Titian. I suspect, therefore, that Vasari's dictum grew out of occasional and exceptional work, which, even exceptionally, would not have been possible in tempera, the medium of the painters before Titian.

We have already seen that Bellini introduced an amount of individuality in the heads of his sacred personages which was not found as a rule or admitted as orthodox in the earlier Tuscan schools; and this characteristic is found in all the Venetian school, and became the foundation of its greatness in portraiture. The visit of Albert Dürer to Venice in 1506 does not seem to have affected Titian, though it may have had a slight influence on Bellini; nor does Titian ever appear to have been much influenced in the tendencies of his art by any of the foreign schools. There seems to have been a deep-rooted individualism in the Venetian race, which, with the strong naturalistic tendency, kept the art of Venice from being invaded by that of the southern provinces; but even this does not account for the powerful grasp of the most subtle and difficult problem in all art—that of the true relations of color to design. The intercourse of Venice with the East, and familiarity with eastern products, always so naïve and poetic in their use of color, probably had much to do with it; but there must have been something in the temperament which made the ground propitious to the development of the color sense, for the men of the central Italian schools, even when they had the work of Titian and Giorgione before them, never understood the mystery and never caught the true color feeling. They learned to paint with more warmth and fidelity to nature, but the essential motive of Venetian color was orchestral (to borrow a word from the sister art of music), and this was never apprehended by the Tuscans. This quality is found in the work of Bellini, and was

extended by Titian and Giorgione; it is seen in individual forms in Tintoretto, Veronese, Bassano, and others of the time, and appears in a fantastic and artificial development in Tiepolo, who was the last of the great colorists. The date of the new departure from the restraint in which Bellini held the system was probably that of the work of Giorgione and Titian on the Fondaco de' Tedeschi, in decorative work which was freed from the conventional limitations. This was in 1507-08. After that time there was a period of turmoil and great political vicissitudes in which at the last Venice was worsted, and the records of the time are full of more important matters than art. In 1511 we learn that Titian was at work at the school of Padua with Campagnola, who was his assistant. He returned to Venice in 1512, and in the following year he appears as the applicant for an order for a battle-piece for the Council Hall and for the first vacancy as broker at the Fondaco, a privilege already accorded to Bellini and Carpaccio. In the mean time he had received and declined an invitation to go to Rome to work for the pope, and at the death of Bellini he became his successor in the brokery and in the office of portrait-painter to the doges. In 1517 he went to Ferrara at the call of Alphonso d'Este, and for him painted several pictures, of which part are now in various public and private collections. From this time Titian was occupied in work for various royal and princely clients until 1523, when he returned to Venice to paint the portrait of a new doge, Andrea Gritti. Of this time is the fresco over a landing of the Ducal Palace—"St. Christopher Carrying the Christ-child"—which still remains in not too damaged condition to be judged as an example of his fresco-work. About this time he married, and in 1530 was a widower with three children.

In 1532 the artist is called to Bologna to paint Charles V., who had come there to meet the pope. This call—which he obeyed, one can imagine, with a satisfaction meet for the occasion, for he was avid of honors and noble relations—was important to his after-life. He became the painter of the emperor, and shared his friendship, which, if we may believe the chronicles, was more to his pecuniary advantage indirectly than directly, for the emperor was a heedless paymaster; but the relation led him to Rome, where he was charged with various commissions and made the acquaintance of Michelangelo and the works of Raphael and the Greeks. But though much has been said of his having been influenced by the great Tuscan, I cannot find evidence of it in his work. Titian and his great contemporary, Michelangelo, greater intellectually than he, had little in common except the love of art. The combi-

L' HOMME AUX GANTS, BY TITIAN.

nation of their forms of art was impossible. Titian was then sixty-nine years old, and had a mastery of his own form of art which was as much beyond that of Michelangelo in painting as the latter was above the Venetian in his creative power in pure form as we see it in his sculpture. Michelangelo might envy the color of Titian and desire to add it to his design, as he is said to have attempted to do through Daniele da Volterra; but to imitate the color of Titian it was necessary to have the Venetian temperament, which could not be assumed for an imitation. It is impossible that Titian should have been led away by the Tuscan's color, and he drew well enough to give any degree of refinement he aimed at. But the naturalism inherent in the genius of Venice rejected the ideal forms of Michelangelo, and was indifferent to the creations of antiquity. Vasari says that he went to the Belvedere, where Titian was painting in Rome, to accompany Michelangelo on a visit to the painter. They saw the "Danaë," and, as Vasari reports, the sculptor said of Titian "that his color pleased him, but that it was a fault that at Venice they did not first of all learn to draw well; for if this man were assisted by art as he is by nature, especially in imitating life, it would not be possible to surpass him, for he has the finest talent and a very pleasant, vivacious manner."

This expression may be taken as the demonstration of Michelangelo's one-sided estimate of art. He could not admit that color required the same profound study and was capable of as great exaltation and artistic refinement as design. His feeling and powers were those of the sculptor, and color was merely the accident of nature. What art gave, to his way of thinking, was the mastery of design, the faculty of carrying the imperfect material with which nature furnished the artist up to the ideal, as one saw it in the work of the Greeks and as he tried to carry it in his own; beyond this, or compared with this, art had no aims other than subsidiary. Titian's comparative indifference to the perfection of his forms seemed to Michelangelo ignorance of art; the former may have felt, if only as an incidental charm, the dignity of the types of his great rival, but if so, it produced no permanent influence on his art.

Titian remained at Rome only a year, and in 1547 he was summoned to Augsburg to the emperor, who was in his glory, and wished to secure its record. Of this visit many portraits of the great or noble men about the emperor were the fruits, of which some remain. Titian's court life was brilliant and, what was not always the case, profitable, and he returned to Venice much the richer, but always greedy of

wealth and ready to adopt any form of servility to improve his estate. He was ready to kiss the hands or even the feet of the potentates who held the keys of success, and to beg or petition for places for his son or commissions for himself. In 1549 he was back in Venice, and returned to the imperial court at Augsburg again in 1550. His life from this time forward is little else than a succession of honors and triumphs. Vasari wrote his notice during the artist's life, and after having visited him in Venice. He says:

When the present writer was in Venice in 1566 he went to visit Titian, and found him, old as he was, with his brush in his hand painting, and he found great pleasure in seeing his works and talking with him.

Of his work Vasari says:

It is true that his way of working in his last pictures is very different from that of his youth. For his first works were finished with great diligence and might be looked at near or far, but the last are executed with masses of color so that they cannot be seen near; but at a distance they look perfect. This is the reason that many think they are done without any trouble, but this is not true. And this way of working is very effective, for it makes the pictures seem living. . . . He has been most healthy and as fortunate as any one has ever been; in his house at Venice he has received all the princes, all the learned and famous men who came there, for besides his greatness in art he has the most pleasant and courteous manners. He has had some rivals, but not very dangerous ones, and has earned much, his work being always well paid, so that it would be well for him in these last years of his life to work only for his pleasure lest he should injure his reputation.

This glimpse of the painter at work in the fullness of his reputation, having, as Vasari says, painted every lord of note or prince or great lady, gives an idea of him which is delightful in its naïveté and suggestiveness, and the delicate bit of advice (the painter was still living when the book was printed) not to do what the critic evidently thought he was doing—sacrifice the quality of his work to the haste to get his orders executed—is significant.

Titian succeeded to the favor of Philip on Charles's death, who seems more anxious on his entry into sovereignty to pay his father's debts to Titian than he was in later years to pay his own, for we have Titian's letters appealing for payment for the pictures he had painted for the emperor, and in the last year of his life (1576) he recalls to Philip the work of the past twenty years, for which he had not been paid. The end of his life, as he died alone of plague, is not pleasant to contemplate, and the last phase of his art shows that he had outpainted his reputation. There is always Titian in it,

but Titian feeble and with tremulous hand, failing to respond to the call of the will, and the sense of color fading. There has lately been discovered, by Signor Cavalcaselle, a half-length, nearly profile St. Jerome of the artist's extreme old age, a picture of peculiar interest, for it has the likeness of himself as the Saint, in devotion over a crucifix. We recognize the mighty sweep of the brush and the clear intention, but the brush trembles and the line vacillates, as it does in the master's latest work at Venice. This work

is often spoken of as the evidence that his powers were unenfeebled when he painted it, but to me it shows the failing of eye and hand alike. The tints are hot, and the impasto tremulous, the composition labored, and inspiration wanting. As the work of one who was almost a centenarian it is amazing, but as that of Titian only a lesson. Of no other painter has it ever been said that he painted ninety years, and when we look at it in that light it becomes a miracle.

W. J. Stillman.

NOTE TO THE LIFE OF TITIAN.

THE following passage from Boschini (*Ricche minere della pittura Venetiana*, di Marco Boschini: Venezia, MDCLXXIV) will prove of interest to those who care for the ancient methods of painting, as Boschini was a friend of Palma Giovine, and near enough to Titian's age to have seen him paint, though, as he does not say that he did, this is not to be presumed. At all events, he certainly was able to learn all that Titian's pupils and personal circle could tell of his ways. He says: "Giacomo Palma the young [so called to distinguish him from the other Giacomo Palma, called the elder], who had the good fortune to enjoy the instruction of Titian, assured me that he toned down his pictures with such a quantity of colors that they served [so to speak] as a bed or foundation to the expression which he was to elaborate on them; and I have seen bold touches with masses of pigment, sometimes a strip of terra-rossa pure, which served [so to speak] as middle tint; at other times with a brush full of white, and with, on the same brush, a tint of red, of black, and of yellow, he formed the modeling of a light and shade, and in this manner he brought out in four touches the indication of a fine figure. And in every respect such ways of laying in delighted those best acquainted with the manner of working technical processes, and desirous of learning the best way to venture on the ocean of painting. After having prepared these precious under-paintings, he turned the canvas to the wall and left it there sometimes for months without seeing

it, and when he wished to take it up again he examined it with great care, as it were one of his worst enemies, to see if he could find in it any defect; and if he found anything that did not agree with his intention, as a benevolent surgeon he reduced the protuberances and excesses of flesh, straightening an arm, etc., and so working, and reforming the figure, he reduced it to the most complete symmetry that was demanded by the beautiful in nature and in art; and then, this all done, he set about another painting till the first was dry, and repeated the operation; and from time to time he covered them with living flesh [here he uses an expression which I cannot explain or understand], *these extracts of the fifth essences*, bringing the work up with repeated repainting to such a point that only the breath was lacking. Nor ever did he work *alla prima*; and he used to say that he who sings, improvising, can never make scholarly verses, nor well polished. But the perfection of these last repainting came at last when from time to time he united the lights with touches of his finger, bringing them near the middle tints, working one tint into another; at another time with a smear of the finger he put a passage of dark into the corners to strengthen them, besides certain touches of red, as it were a drop of blood which strengthened some superficial quality; and so he went on bringing his figure to perfection. And Palma assured me positively that in the finishing he painted more with his finger than with brushes."

DE HANT ER BUZZARD'S NES.

"O you think that the buzzards will build in the old nest again this year, Uncle Abner?"

"Why, bress your lee-tle heart, honey, I cert'n'y hopes dey will. Dey 's been er-buil'in' dar fur nigh onter er hundud yeah, an' when you retches your han' in de holler an' don' feel sumpen lack two lee-tle balls er cotton, dar gwine come trouble on dis heah lan', shore."

"Tell about it, Uncle Abner; do, please."

"Hain't it 'mos' time you was er-bed, honey? White folkses cain't toas' dey shines all night lack niggers. Well, well, ole Unc' Abner tell it jes' dis onct. You, Rob Roy, fling ernudder chunk on dat ar fire! Squar' roun' an' give dese heah ole foots er chance! Um! gittin' mighty cole fur Feberwary, an' de a'r smell powerful lack snow; de ole 'oman shake de fedders out'n her piller-slip 'fore mornin', I spec'."

"Well, as I were er-gwine fur ter tell you, dey 's been er-buil'in' dar fur nigh onter er hundud yeah, an' dey nebber fail but one time; den dey fail right erlong fur three yeah! It

"AN' TELL 'IM MIGHTY SOLEMN 'BOUT DE NES'."

were long erbout '59 or '61, an' dar were er mighty gedderin' er comp'nies, fur we all spec' we gwine ter have er wah. Sech er gittin' up er fine toggery an' sech drillin' an' cavortin' 'mongst de boys! It were all mighty fine fun fur ter be sodgers, er-shakin' er dey long fedders on dey hats, all hitched wid er gole star, an' er-prancin' in dey gray clo'es, fur dey don' know what wah were *den*!

"Your paw he were ole Miss's baby boy, he git ter be er cap'n, an' de house were plum' full er sodger boys, er-gittin' ready ter 'go out' fur ter whup dem Yanks tuther side er nex' week. Ole Marse, your gran'paw, honey, he were too ole fur ter go out, but he give he house ter 'em, an' work fur 'em, an' ride fur 'em, an' hope 'em cuss. Nobody think nuffin' 'bout de buzzard's nes' den. Well, dey 'go out,' an' we heahs big things 'bout de boys er-bein' er-moted an' sech, an' we all proud, lack ter bust. Well, de early spring come 'roun', an' ole Marse he sen' me one day, he did, wid er letter ter Misser Powell, wha' live on de nex' plantation. I hatter pass right by de ole holler oak, an' I says ter myse'f, says I, 'When I comes back I feel an' see if de buzzards come yit.'

"Well, I tucken de letter an' putten de answer in my pocket. It were er mighty putty day, de a'r all hazy wid de 'leetle wood-folkses house-cleanin', an' de trees an' de plum thickets so fresh an' sweet wid dey new leaves. I sees de ole tree, 'way over yander, er-flappin'

her arms fur ter make de leaves come fas'er, an' I falls ter wond'in' how ole she air, an' what make de big holler right in her heart, an' how de buzzards fin' it out. I comes 'long closter, an' I sees de white sand-pit, flat an' big as er flo', whar nuffin' ever grow, an' whar de hants dance in de dark er de moon; an' I sees de big brack'n on dis side, wha' grow tall 's er big man, dough I feels sorter oneasy in my min', 'ca'se, honey, I were *borned wid er veil*. But I kneels down an' retches my han' in de holler, an' dar wa'n't but *one* leetle buzzard dar, an' he were *dead*! Lawdy! did n't de cold sweat jes bu'st out an' rin down! But I riz up, an' taken de letter ter ole Marse, an' tell 'im mighty solemn 'bout de nes', an' 'bout de ole prophesyin'; but he jes laugh an' say, 'Go 'way, Abner, 'long er your nigger tales!' dough he do look mighty cu'i's, an' go see fur hese'f; den 'pear ter furgit plum' all erbout it. White man ain' lack er nigger; he heah onsart'in things, den laugh an' go 'bout he business; but er nigger he tote it in he min', an' stedly 'bout it.

"Well, bimeby all de niggers gits holt er it, an' dey all trapes down fur ter feel de dead buzzard wid dey own han's. Den dey hole er big meet'n' on Sad'day night down by de sand-ditch, an' ole Parson 'Bias he lead. He were f'om Misser Tarleton's plantation, but dey could n' have no big meetin' dout'n¹ ole 'Bias fur more 'n fifty mile erroun'. Oh! how de pra'rs went up, full an' strong, fur 'liverance

¹ Without.

f'om de spell er Satan, f'om de transgressions er de people wha' bin er-dancin' sumpen 'sides de 'ligious dance, f'om de sins wha' besot us on bofe han's, dat we mought be geddered tergedder lack chickens on one roos'! Oh, dey was fetchin' pra'rs, honey! Dar was no lessen twenty unner conviction, an' ten mo' onsart'in s'archers on de mourners' bench! But bimeby dey all git quiet, an' de white folks done furgit all erbout it; de niggers 'don' tell all dey sees, but keeps up er power er steddin'. Dar were shore 'nough wah now, an' your paw, honey, wha' were ole Miss's baby boy, he ain' got no time fur ter come home, dough ole Miss she gittin' mighty po'ly, an' ole Marse he walk de

fur nuffin'! De ole uns cry an' holler, 'O Lawd! how long it gwine be?' but de young uns walk off peart an' sassy, lack de goslin's dat gwine git inter trouble 'fore de hin kin git dar.

"Well, I knowed dar were trouble er-comin', honey, 'ca'se I were borned wid er veil. Bimeby we don' heah no more f'om young Marse, an' one day we fixes up good eatin' fur de Rebs, an' sont word by 'em; an' nex' day de Yanks come 'long an' rob de smoke-house, twel we ain' got nuffin' good fur ter eat lef'. Den one rainy, soggy mornin' young Marse he comes home wid er ball in he shoulder. I never will furgit dat day! Dar he lay, so

"FUR TER FEEL DE DEAD BUZZARD WID DEY OWN HAN'S."

flo'res'less-lack. We hatter ride 'way over tuther side er Bolivar fur ter git papers an' sech f'om de front, an' when ole Miss git 'em, 'pear lack she dat glad she 'mos' eat 'em.

"Well, de two year roll roun' erg'in, an' dey ain' one leetle buzzard dar, not eben er dead one, airy spring! We all feels sorter on-easy in de min' fur er while, but dar ain' nuffin' happen. De buzzards jes tired, an' wanter give de ole tree er rest, dat all, an' de niggers sorter laugh at ole 'Bias. But he shake he head slow, an' 'zort an' prophesy 'bout de lamentations er de people gwine bust, lack er mill-dam in de spring; fur de wicked gwine wag erlong lack er big warnut-tree dout'n any warnuts on it; but de winter comin', an' de ax gwine hunt fur dem roots, an' it gwine be split inter fire-wood, 'ca'se it done tuck up de groun'

still an' white, jes lack he dead, an' we all fly 'roun' lack chickens wha' git dey neck runged. Ole Miss she cry, an' wring her han's; she ain' got no darter, all her chillun bein' man-chiles, an' your maw she come over an' stay wid ole Miss, an' hope nuss young Marse.

"She were er putty leetle gal den, in er white coat, wid big blue eyes an' long yaller hair,—she had n' married your paw den,—an' sech times we all had! Dar she were, er-beat-in' er he pillars an' er-readin' ter 'im, when he got better, an' er-goin' in de kitchen, er-scrap-in' up, fur ter make good things fur 'im (honey, we was mighty short), an' er-smilin' at ever'-body, twel it seem 'mos' lack we ain' got no trouble nor wah nor nuffin'! Well, bimeby young Marse he git erbout, an' he look mighty white, but he say he got he principles ter fight

"OLE 'BIAS."

fur, an' one putty mornin' he kiss 'em all 'roun', an' ride erway. Den ole Marse he shut hisse'f up in he stiddy, an' ole Miss she fall mighty po'ly, but Miss Kate,—she ain' got no maw,—she stay wid her, fur ter hope her up. But ole Miss she don' git no better; she want her boys herse'f, an' want 'em ter fight fur dey principles, too! Po' ole Miss! But 'oman folkses is cu'i's creeturs! Ole Marse he say he sen' fur 'em, but ole Miss she say, No; she b'ar it lack er Sparring, er sumpen. But she did n'—po' ole Miss! She were de bestest 'oman dat ever breaved, shore! But she were po'er an' po'er, twel she sorter laugh sad-lack, an' say ter Silvy dat her clo'es don' fit her no mo'; dat clorf were hard ter git anyhow, an' she cut 'em up an' have two dresses whar she had one. Ole Marse he don' 'pear ter see how she fail, but de doctor he come an' say it were her heart dat was de matter, dat she want her boys, dat she mus' 'pear'n up an' be proud er 'em, an' let 'em be true ter dey principles.'

"Den ole Miss she git mad, an' say she don' want 'em home; she would n' let 'em come! Ef dey wanten, dey no sons er hern; but if Doctor Jinkins did n' have no physic fur ter hope her, he mought as lief stay at home. But po' ole Miss! she were er-grievin', an' we knowed it. One night dey wake us all

up, an' say ole Miss mighty sick, an' dey want some un ride fur de doctor right quick.

"It were de dark er de moon, an' de very stars look skeered-lack an' hazy; de big owls hollers an' laughs down in de wood-lot, an' er leetle screecher he keep er-shiverin' 'way over in de nigger buryin'-groun'. Eben he knowed he hatter pass dat buryin'-groun', but he say he go, an' he mount de ole gray mar' muel, an' start. Well, he ride 'long, er-whistlin' fur comp'ny, er-feelin' mighty scrumptious as he nigh de nigger graveyard, dough he ridin' right fas'; but he ride right 'long twel he come ter de buzzard's nes' tree, when dat ole Jinny muel, she r'ar an' fling dat Eben plum' over her head—I allus did 'spise er gray mar' muel. Well, he pick hisse'f up,—er muel never did break er nigger's neck, nohow,—an' mount erg'in; den she r'ar dis time, an' Eben look, an' right dar under de buzzard's tree, er-standin' wropped in de robe er de windin'-sheet, were er hant, wid his long arm er-p'intin' over at de big house!

"Dat Eben he did n' wait fur it ter call him, but he 'clude mighty quick fur ter go ter de doctor's roun' tuther way. So he ride fitten ter bu'st er trace; but when he git ter de crossin' dar wa'n't no crossin' dar, fur de rain done swell de branch twel she rin lack er ribber; but he swing dat ole Jinny muel in, an' swum it!

"Well, Doctor Jinkins he git here jes 'fore day, an' dat nigger he come in rale ashy, er-shakin' lack he got de agur. He don' want ter tell what he seed, but he set in de cabin, an' rock hisse'f, an' moan, twel he rin we all pretty nigh plum' crazy.

"Well, de doctor say dar ain' no hope fur ole Miss; her heart were jes plum' broke, dat was all. She mought live two days, an' den erg'in her moughten live fo' hours.

"Oh, dat sun, when he come up, seed er power er weepin' an' cryin' 'mongst we all—'mongst de big an' de leetle, de black an' de yaller! Fur de niggers all loved ole Miss, plum' lack she were kin, bred er blood an' bone; fur she keep ole Marse f'om bein' hard on de lazy uns, an' de good workers she make much er herse'f. Arter breakfus ole Miss she sont fur us dat waited roun' de house. Dar wa'n't many er us, fur Marse Clar'nce, ole Miss's ol'es boy, he caired er big lot er niggers off ter Texas at de breakin' out er de wah.

"Well, ole Miss she sont fur us, and we all come in wid er big lump in de thote; den she talk ter we all, twel it seem lack we 'mos' see de pearly gate er heaven er-swingin' back fur ter let her in! Ole Marse he sot dar wid he head on he han's, an' jes keep er-lookin' at er spot in de carpit. Den ole Miss she talk ter him sof'-lack, an' tell him ter be good ter her niggers when she gone, an' ole Marse's lip it

trimble, an' he look hard at de spot in de car-pit, an' she say we has all been on de place so long twel we was chillun ter her, plum' lack her chillun.

"Den she tell Dilsy, wha' were de house-keeper an' tote de keys, ter allus give Aunt 'Nerve some white sugar, if dar any dar, when she ailin', lack she allus do; ter see dat ole Mammy Mary got plenty flannens an' tea fur her rheumatiz when it cole: ter do dat if she love her, an' dat Dilsy she fling her ap'un over her head, an' cain't talk fur she cry so; but she nod her head, fur ter say, 'Yes 'm; I do it.'

"Den ole Miss she say good-by; dat she wait fur we all tuther side er de ribber, wha' dar room fur all good white folkses an' niggers too. Den we all go out solemn, lack 't were er funeral, an' dar wa'n't no work done dat day. De a'r was all hazy, an' de sun keep gittin' behin' er cloud, an' we all sot erbout an' talk low in de quarters. 'Bout sundown de dorgs 'gin ter howl moanful-lack, an' er whup'-will he cry so lonesome an' pitiful; den ole Mammy Mary she say solemn dat 'Def done come!' an' fol' her arms, wid de big water er-drappin' out 'n her eyes, an' rock, an' chant er song er de dead. Honey, dey were times er sorer an' great tribberlati'n, dey was! Arter while we all could n' talk fur de choke in de thote, an' jes sot an' wait; we don' want nuffin' ter eat, fur it wa'n't no time fur eatin' an' drinkin', an' 'mos' all er us could n' swaller. Bimeby Dilsy she come er-swingin' an' er-rockin', wid her face all kivered up, an' go in her cabin an' shet de do'. Den we knowed it were all over.

"Po' ole Miss! dat allus hoped up de po'ly, an' make de weepin' laugh; dat went erbout jes er-totin' comfort fur de sufferin', be dey white er be dey black! Po' ole Miss! dat 'u'd take her fines' linen any day fur ter make er po' ole black nigger er windin'-sheet! Honey, if dar's one angel in de big sky erbove, your gar'maw's dar.

"Well, dey laid her out in de big parlor, wha' ain' been open sence young Marse went er-way, wid her ole red Bible, wha' she read ter we all eve'y Sunday nigh onter thirty yeah, wide open on her bres' at de tex', 'Bressed air de pure in heart: fur dey shall see Gord.' An' she do see him, honey, right now, at dis bressed minute. Dat night de big owls dey come an' set on de well-house, an' holler an' look in at de winder, so 's we hatter beat 'em off wid brooms; an' de frogs hollers lack dey miss sumpen; an' de dorgs howls lack dey miss sumpen; an' ever'thin' seem lack it cryin'. We cain't git no word ter any er de boys, fur de blockage, so nex' day de neighbors f'om all erroun' comes, all er-cryin' an' er-tellin' sumpen wha' ole Miss done fur 'em, an' we lays her erway in de fambly buryin'-groun', wid

ole Marse, Miss Kate, an' all de niggers fur de fambly mourners. Dat evenin' when de sun was nigh onter set, me an' Silvy went an' plant some white vi'lets, wha' ole Miss loved, on de new grave, an' sot dar an' talk low twel it gittin' plum' dark; den we comes in, slow an' sad-lack, an' lef' ole Miss 'lone ter Gord!

"Arter dat, trouble come thick an' fast. One by one dey fotch in de boys, woun'ed or dead, all 'cep'in' ole Miss's baby boy, your paw, honey. He stay an' fight fur de principles er all 'em, de livin' an' de dead, an' 'pear lack de bullets were efereaded, an' cain't tech 'im no mo'. Den ole Marse he taken de p'al'sis jes as hopeliss as er baby; an' twix' de bush-whackers an' de grillers, an' de grillers an' de bushwhackers, we ain' got but two er three hosses er muels lef' an' leetle er nuffin' in de smoke-house. We all niggers hatter run dis heah place by ourse'fs, on one wheel, an' one wid de spokes bruk, at dat. We hatter lie ter de derved ole blue varmint, an' de grillers, wha' were jes as bad, dough dey do w'ar de gray, 'bout de fambly silver an' ole Marse's money, wha' we all buried, twel dey 'clar' dey make eve'y year ole tree in de county hol' er strung-up nigger!

"'Pear lack ole 'Bias, wha' prophesied 'bout de buzzard's nes', wa'n't no sech big fool arter all, an' de niggers wha' laughed don' laugh no mo'. Den dey sot it er-goin' dat de hant stan' unner de ole tree eve'y night; he don' wait fur de dark er de moon, but stan' dar in de shinin', er-swingin' his long arms ter de norf, an' den ter de souf, an' ole 'Bias he prophesy erg'in, an' chant 'bout de strong man er-bein' tucken in de battle, an' de mighty fighter hatter give in; an' he say dat de Yanks gwine whup us shore! Den he perpare ter 'view de sperrit, wha' cain't res' in he grave, an' ast wha' he do wid de buzzards, an' wha' he got on he min'. An' ole 'Bias he gadder de brack'n seeds while he chant, an' putten 'em in he shoe; den he taken he charm, wha' were er rabbit fut, er sarpint's toof, an' er squorerpin's¹ tail, wid er pinch er graveyard dust, sewed up in er bag, an' wait fur night ter come. Well, de moon were er-hidin' dat night, an' we all went wid ole 'Bias nigh ter der nigger buryin'-groun',—all de preachers, de 'zorters, an' de Christians,—den he went on erhead, in de plum thicket, fur ter strive wid de sperrit. He creep up by de tree, an' taken he shoes off in de high brack'n, wha' were er-rockin' in de night-wind, lack it were er-grievin'. Den he riz up an' chant low an' solemn-lack, er-callin' on de sperrit, wha' ain' flesh, needer blood nor bone, fur ter answer him; an' he stan' dar wid de wind er-blowin' er he white hair, an' wait. Jes den er big owl in de holler tree he open he head

¹ Scorpion.

an' holler, 'A-hoo! A-hoo-a!' an' ole 'Bias he don' wanter wait fur ter heah wha' de sperit gotter say; he ain' got no time fur ter git he shoes, but he jes light out f'om dat ar place quick, in he bar' foots!

"Arter while dey hatter bury er dead nigger in de graveyard; den we fin' out wha' make de hant. Dar in de cornder er de worm-fence, wid he gray clo'es done all spotted wid blood, were de body uv er Comfedrit sodger; he were woun'ed, an' were er-comin' home, but he could n' git no funder, an' he jes laid down ter res' whar de po' ole niggers sleeps. Well, dey buried him in de fambly buryin'-groun', 'longside er Marse Roy. Dey don' know who he be, but dey w'ar de same clo'es, an' dey fit de same fight, an' dey was brudders in de principles!

"Well, de hant still walk roun' de buzzard's

¹ Within.

² Millennium.

nes' tree, an' we don' know wha' he want, fur dar ain' nobody try ter 'view 'im sence ole 'Bias, an' dar ain' no nigger on dis heah place dat 'll go d'in¹ er mile er it at night; an' 'pear lack he 'll walk an' walk, twel de 'lenium² come fur ter let 'im go!

"Yas, sir; if de buzzards don' buil' in de ole nes' dis yeah, dar gwine come trouble on dis heah plantation, shore!"

"Uncle Abner, do you reckon the hant 'll catch me if I run all the way between here and the house?"

"De Lord bress your soul, chile! hain't you gone ter bed yit? You Silvy, tote dis heah chile uv ter de house, quick! Miss Kate 'll be er-thinkin' dat dese trompers done steal him, shore!"

"Good night, Uncle Abner."

"Bress your leetle heart! good night, honey!"

Virginia Frazer Boyle.

THE AUSTRALIAN REGISTRY OF LAND TITLES.

HE hearty approval which has been given to the method of voting known as the Australian ballot, and its adoption in several States, may rightly raise the question whether a body of Englishmen brought up

under the English common law, containing among their number an unusual proportion of well-bred men, migrating to colonies of great productive capacity, may not have found out many other ways to improve upon English methods before such inherited methods had become wholly incorporated or ingrained in the customs of the people of the new States.

In one respect, at least, the settlers in the United States improved upon the mother country in establishing a registry of deeds. But the Australians seem to have made a long step in advance even of ourselves in the matter of registering titles to land, and by the same process assuring indefeasible possession, while taking possession of the deeds or evidences of title after the registrars have passed upon them.

To the mind of the writer the distinction between the registry of a deed and the assured registry of title was not at first very plain; it may not be very apparent to the readers of *THE CENTURY* who are not of the legal profession until it has been explained by one who is also not learned in the law.

The registry of deeds suffices to put upon a

public record the conveyance of all claims to the possession of land, good, bad, or indifferent, whatever they may be; but it does not clear or assure a title. Through ignorance or carelessness in making deeds, this public record may even bring the possession of land which has once been clear and free from any cloud into a condition of complexity and doubt, and it may, as time goes on, increase rather than diminish the defects and may cloud more and more the titles to land.

The registry of titles, on the other hand, according to what is called the Torrens system, which has been adopted throughout Australia, New Zealand, and in British Columbia, clears all fair and honest titles, removes all existing clouds, and gives the occupant whose title passes the examiners in the first instance indefeasible possession; while at the same time rendering the future transfer or conveyance of the land as simple and as ready as the transfer of a share of railway or factory stock now is in this country, and reducing the cost of conveyance, as it has been well put, "from pounds to shillings."

The legal aspect of this question might well be presented by some one who is learned in the law. The writer purposes to give only a simple description of this method, which was introduced into South Australia in the year 1858 at the instance of Sir Robert R. Torrens, who was first an officer in the customs department and subsequently colonial treasurer. This gentle-

man had gained a good deal of experience in the customs department in passing the indefeasible titles to ships by a registry. Upon entering upon his duties in Australia, his attention was called to the growing complexity in the system of land tenure, which was then conducted in English fashion under the law of primogeniture, the system which on the decease of the owner vested the title to real estate in the eldest son. He conceived the idea of establishing a system of surrendering all deeds to land, coupled with a registry of title by the state in a manner corresponding to the sale and registry of the titles to ships.

His purpose has been most fully accomplished, and the benefit which has ensued could not be more concisely stated than in the book of Mr. Franklyn entitled "A Glance at Australia in 1880." Mr. Franklyn, page 126, writes thus:

Nor must we forget to remind our readers in England that under the Land Transfer Act (New Zealand), which is almost a transcript of the admirable measure introduced into South Australia by Sir Robert R. Torrens, and afterward adopted by the legislature of Victoria, real estate can be bought, sold, or mortgaged by a very simple and inexpensive process. The Government guarantees an indefeasible title; and all transactions relating to land are so expeditiously and cheaply effected that, in the year ending the 30th June, 1879, the cost of each of 17,422 registration sales and mortgages, covering property to the value of £7,585,291, was only 22s. 9d. Let any one who knows anything of conveyancers' bills in the mother-country ponder well upon the full force and meaning of these highly significant statistics. Land can be dealt with as easily as a share in a ship or a joint-stock company, and with the same security as regards title. Trusts are not registered; but instruments declaring trusts may be deposited with the registrar for safe custody and reference. These deeds are binding between the parties to them, but they in no way affect persons dealing with trustees who are registered proprietors. Under the Land Transfer Act it is not necessary to examine the deeds in the abstract of title; these no longer exist. They have been delivered up to the registrar, and when a certificate of title is granted they are canceled. An investor, therefore, does not run the risk of a mistake or blunder of his solicitor. Every transaction has its finality and complete security.

The Torrens system opens the way to this useful end in a perfectly simple and safe manner.

Leaving, therefore, all the legal aspects of the case for treatment by others, the writer will deal with this subject in a popular way, treating only the existing laws of the British colonies in a way that may be readily comprehended. In doing this he will refer to a pamphlet (undated) published by the Cobden

Club about the year 1881, which contains essays and addresses which were prepared by Sir Robert R. Torrens in his futile attempt to overcome adverse influences in Great Britain, which have thus far prevented the introduction of this system into his native country. This pamphlet is published by Cassell and Co., price 6d.; it can be ordered from their place of business in New York. The writer will also refer to very instructive letters received by himself, in answer to his inquiries, from Mr. T. V. Townley, Registrar of Titles in British Columbia, and from Mr. J. M. Thomas, Secretary, and Mr. W. M. Bacon Carter, Registrar-General of the Colony of South Australia, from whom he has also received copies of the acts under which the land titles are now registered.

The acts consulted by the writer are chapter 67 of the Acts of the Legislative Assembly of the Province of British Columbia, 1888; and Act No. 380, known as the Real Property Act of 1886 of the Colony of South Australia, in which all previous acts were consolidated, subject to only three amendments since that date, which are contained in Act No. 483 of 1887. The writer has also been furnished with data by the Surveyor-General of western Australia, and has obtained valuable information from the officials of New Zealand.

Reference may also be had to the excellent "Consular Report" of Consul G. W. Griffin, Nos. 110 and 111, page 760, published by the State Department of the United States.

The writer is thus definite in giving references to documents which can be readily obtained, for the reason that it can hardly be doubted that it may become expedient for the people of many States in this country to give close attention to the subject. In the Southern States especially it will soon be absolutely necessary to take measures to clear the titles to land.

Without making further specific reference to these authorities, the following simple treatment will cover the main points of this system. I shall incorporate in this treatise many statements in substantially the same form as they are given in the authorities which I have cited, without confusing the text by marks of quotation. My object is merely to give a clear and concise digest of what has come to my hands upon a subject about which I had no previous knowledge until, among many of the benefits of being a member of the Cobden Club, the essays of Sir Robert R. Torrens were sent to me. Even then my interest was not fully excited until the merits of the Australian ballot were developed in practice in this country.

It should be remembered that no one is compelled to bring his land upon the registry of titles; if one prefers to rest upon the regis-

try of deeds as now established, there is nothing in any of the acts to prevent his doing so. If, however, a title is once registered, it cannot be withdrawn, because all deeds are then surrendered and the register of the deeds must be closed. Transfer by registered title thereafter takes the place of the execution of deeds.

It may be remarked that the change could be made in this country much more readily than in a country where there had been no previous common practice of registering deeds, and therefore no adequate preparation. Whereas there are now established registry offices and public officers empowered to register deeds, therefore the registry of titles could be established so as to be conducted by the same officers, to whose number would be added the examiners of titles prior to their admission to the registry. It would be very easy to provide for the payment of the examiners of titles by established fees suitably governed according to the amount of work and the value of the property, so that the same conveyancers who are now employed by owners in passing a title would be employed by them in putting that title on the registry. A long time would elapse before the whole land had been treated; therefore while in the end the number of conveyancers would be very much diminished, yet for a considerable time even more work might be required of them. In the interval the work of the title insurance companies would also be of great service, but their function would probably be gradually converted into that of mortgage security companies lending money on registered land titles.

What then may be done to promote this change, if it proves to be expedient?

Conveyancing by deed without registration is the common rule in England; registering deeds, the common rule in the United States. Conveyancing by registration of title was not new when Sir Robert Torrens applied it in Australia, although it is said that his attention was first drawn to the subject through his experience in the registry of ships. It has been in operation for over a century in Prussia, in Bavaria, and in other European states, notably in Hamburg, which until lately was one of the free cities, where a similar system has been in operation for over six hundred years. Purchasers of estates in Paris may also obtain an insured title by payment of a small fee to the city.

In Australia the method of procedure is described as follows: The person or persons in whom the fee is claimed to be vested may apply to have the land placed on the registry of titles; these applications, together with the deeds, evidences, and abstracts of title, accompanied by plans of the land, are submitted for examination to a barrister and to a convey-

ancer, who are styled examiners of titles, who examine the titles exactly as they would on behalf of an intending purchaser, if the title were not to be registered. The report of the examiners is made to the registrar. If the title is a good holding title, the application is admitted. Should the applicant fail to satisfy the examiners, it is rejected. If there is evidence of title wanting, of which the reputed owner can compel completion, notices corresponding in many respects to those required in our probate courts are served, according to the nature of the case. Notices are served, if any are required, as the examiners may indicate, upon any person likely to be interested in law or equity who has not joined in the application, and upon owners and occupiers of contiguous land. These notices set forth the purport of the application, and intimate that unless objection be made by lodging a *caveat* within the time prescribed by the registrar, the land will be brought under the provisions of the act and an indefeasible title will be granted to the applicants. If within the time appointed a *caveat* is lodged, the action of the registrar is suspended until it is withdrawn, or until a final judgment of the supreme court can be obtained upon the question raised. These notices are given by publication, and are complete and final.

The certificates of title are issued in duplicate. These certificates set forth the nature of the estate of the applicant, whether a fee simple or a limited ownership; they notify, by memorials indorsed, all lesser estates, leases, charges, easements, rights, or other interests current or affecting the land at the time. Ample space is left for the indorsement of subsequent memorials recording the transfer or extinction of future estates or interests.

Applicants are not subjected to the expense of putting the paraphernalia of a court of justice in motion, unless there be some adverse claim to be adjudicated upon.

It is held that "indefeasibility is indispensable if the dependent or derivative character of titles, out of which all the evils of the English system originated, is to be got rid of." But yet, since in spite of every precaution a mistake may be made in granting indefeasible titles, a small charge is made at the rate of one half-penny in a pound sterling, which amounts to twenty-one one hundredths of one per cent. (say one fifth of one per cent.), upon the value of the land when first brought under the system, and upon the value of the land transmitted by will, or upon the intestacy of the registered proprietor. This almost inappreciable sum has been found far more than sufficient for the object. A large insurance fund has accumulated in each colony during the period in which the act has been in operation.

It was held that this principle of compensating a rightful owner by a money payment, if perchance a lawful claimant had been deprived of land by an error, instead of allowing him to recover the land against a good holding title, would commend itself to the sense of natural justice, as contrasted with the principle of English law which in such case would place an owner in possession not only of his inheritance of the land itself, but also of the capital of parties who, being wholly innocent of all fraudulent intent, may have invested their fortunes in buildings and other improvements thereon.

On the other hand, it was held that a great economic principle would be subserved by a system which would give absolute security to the employment of capital in improved land. At the time of the publication of Sir Robert R. Torrens's essays in 1881 he was enabled to say that the practical result had already been to add largely to the wealth of the community by restoring to their value as building sites many blocks of land which had been deprived of that special value by technical defects and uncertainties attaching to the title. Subsequent evidence more than sustains the testimony of Sir Robert R. Torrens.

The rules in respect to the registration of mortgages are equally simple. The evidence of many parties who have borne testimony in parliamentary investigations of the subject, and in other ways, is conclusive on this point.

In 1879 Sir Arthur Blyth, Agent-General of South Australia, in which colony he had resided over twenty years, holding a high political and commercial position, testified before a committee in the House of Parliament as follows:

Registration of title is almost universal; for one transaction under deeds now there are one thousand under the Real Property Act; it is a curiosity if you get a person with deeds. To a person wanting to borrow money of me, I should say, first, "Real Property Act, I suppose?" Then the next thing would be, "You do not want a lawyer, I suppose?" He would probably say, "No." I should then say, "Come with me to the registry office; you have got your certificate with you." I should draw out a mortgage on the counter at the registry office, where printed forms are provided, have it witnessed and handed to the clerk, saying to him, "It will be ready to-morrow afternoon, I suppose?" When the mortgage is paid off, the transaction is even simpler. Suppose you were the mortgager and I were the mortgagee. Before you give me the money I should sign this receipt before a well-known person, and give it to you, and let you go and clear your title.

To the suggestion adverse to the adoption of this system in England, derived from the more recent origin of titles in the colonies, it

was held that many of the titles there dealt with, and those among the most valuable, dated back sixty years or upward; and that owing in part to unskilful conveyancing in the earlier days, and in part to the frequency of dealings with land in new countries, complexities and difficulties no less grievous than those which oppress the landed interest in the United Kingdom had been superinduced upon comparatively recent titles.

These difficulties and clouds appear to have been fully cleared.

The registrar of New South Wales reported in 1881 that although the Real Property Act, or Torrens system, had been in operation eighteen years, no compensation had been made upon the titles registered, nor had any claim been sustained against the assurance fund, which at that time amounted to a little over thirty-eight thousand pounds sterling.

Under date of February 4, 1890, Mr. W. M. Bacon Carter, Registrar-General of South Australia, in answer to questions put to him by the writer, gives the following information:

The Torrens system is working satisfactorily. It has been established so long (since 1858) that all doubts as to the benefits of the system have nearly vanished. The area of South Australia in acres is 243,244,800. There had been alienated from the crown since the foundation of the colony 6,963,961 acres, of which 5,793,707 had been brought under the Real Property Act. The assurance fund continues to accumulate, and on the 31st of December, 1889, it amounted to eighty-two thousand pounds.

In this colony the estate of deceased persons is vested in all cases in the executors or administrators, instead of the devisees or next of kin, the onus being thrown on the executors or administrators to transfer to the persons beneficially entitled. The law of primogeniture was abolished in 1867, and the real estate in cases of intestacy is administered in the same manner as the personal estate.

The owners of land which has not yet been brought under the act steadily apply whenever they desire to deal with the land, not before. If an owner can prove a title by possession for the requisite number of years provided by the statute of limitations, and can show that the true owner was under no disability when such adverse possession commenced, his application would be passed.

In the colony of British Columbia a slight change has been made: the indefeasible title is not granted until after seven years have elapsed from the first application. The act which is now in force in this colony was framed by a special commission appointed by the local legislature, and was brought into effect in 1870. Before that date a system of recording deeds was in use, but the business done was very trifling. The whole province is now un-

der the later method. It differs from the Torrens system in two important particulars :

First. There is no guarantee fund on the first registry.

Second. The certificate of title first issued is only a *prima facie* title of record.

To effect registration of an absolute fee, the following course is pursued: The application is filled out. It is then the duty of the registrar to examine all title-deeds produced, and if satisfied that the applicant has established a *prima facie* case, a description of the property is recorded in a book called the Absolute Fees Parcels Book, and is also entered in the Register of Absolute Fees, in which is given a short epitome showing the nature and legal effect of the title. A certificate is then issued. After registration for seven years the owner may apply for an indefeasible title. If after advertising for three months no adverse claim is made and substantiated, he obtains a certificate of indefeasible title, good against all the world except the crown. The registrar must be a duly qualified barrister or solicitor. The best evidence that the act works satisfactorily is that no certificate of title has ever been attacked since the beginning of registry under the act in 1870. The popular verdict is entirely in its favor, for every title is sifted as it comes in, and the mistakes of ignorant conveyancers, or those arising from other causes, are rectified before they are allowed to affect the title. One great advantage is that any one can search a title for fifty cents. The great expense arising from the registration of deeds is entirely done away with.

The ordinary fees for registration are as follows: A fixed fee of \$2.25 on each registration and in the case of an absolute fee; in the latter case one fifth of one per cent. of the declared value of the land up to \$5000, and one tenth of one per cent. of the value over that amount, is paid. Suppose a person declares the value of his land at \$7500, and applies to register the title:

The fees are, fixed	\$2.25
One fifth of 1 per cent. of \$5000 .	10.00
One tenth of 1 per cent. of \$2500.	2.50
	<hr/>
	\$14.75

If the \$7500 were a mortgage, the fees would be, fixed	\$2.25
One tenth of 1 per cent. of \$7500.	7.50
	<hr/>
	\$9.75

The whole province is under the operation of the act. Mr. T. V. Townley, the district registrar, who kindly gave me this information, says: "I cannot give you any better idea of the value of the land dealt with than by saying that the fees in this office alone for the

last six months have averaged about \$2200 per month; and there are two offices in the province."

In bringing this subject before the readers of THE CENTURY it will be assumed that all readers will substantially agree upon the following premises:

First. That private possession or ownership of land is necessary to its most productive use.

Second. This ownership, granted or secured among English-speaking people by original titles derived in the first instance from the king, subsequently either derived from the state or acknowledged by it, is held under certain conditions, and is subject to the reserved power of eminent domain, with all that is implied in that legal phrase.

Third. The conditions under which this land is held in private possession may be rightly varied from time to time under due process of law, with compensation for injury done when land is taken, and with due consideration given to admitted rights.

Hence it follows that any system of conveying land from the possession of one person to another which has been so badly administered as to raise a doubt as to who is entitled to hold it in possession, must of necessity be reformed by the state, which holds the only power to apply the remedy to the defects and which may therefore resume its control.

There are many persons who rightly object to state interference in the every-day business of life, but in this matter, if an indefeasible title is to be established, the state must intervene, and may or must resume control because it is the source of title. The state alone has the power to remove the uncertainties which hang over titles to vast areas of land and now prevent their occupancy and use, such clouds having been permitted to gather through the ignorance or carelessness, or in some instances through the fraud, of individuals.

The variable conditions on which land is now held in possession by individuals are as follows:

- a. In respect to the burden of taxation.
- b. In respect to sanitary provisions.
- c. By rules for the prevention of injury to neighbors.
- d. By regulations as to use, as under building acts and the like.
- e. Under the provisions of general or special acts for taking the land for highways, railroads, or other purposes, consistently with the provisions of the laws, which laws may be changed from time to time.

There is, therefore, no absolute private ownership of land in this country.

Under these conditions of private possession, which may be varied from time to time according to the circumstances or the necessities of

the case, it is commonly held that every facility which can be rightly given, and every form of legislation which may be rightly adopted for promoting a wide distribution of land among the largest possible number of persons, conduce to the safety of the state as well as to the common welfare of the people.

To this end the whole influence of the savings-banks has been developed in New England and to a considerable extent in New York. The same object is also promoted by the organization of coöperative banks, so called. In Pennsylvania and in Maryland the distribution of land has been promoted in yet greater measure than in the Eastern States by the organization of building-societies, by sales on terminable ground rents, by title insurance and mortgage security companies, and in other ways. In other parts of the country building-societies, savings-banks, and other organizations are being rapidly established with the same object in view. But underneath, and in greater or less measure obstructing all these instrumentalities or agencies for promoting the division, sale, and productive use of large parcels of land, lie the growing complexity and uncertainty in documentary titles, often accompanied by heavy cost in conveyancing, and in very many cases by doubt as to the existing title to the land itself being a perfect one. Upon such matters only the state can take action.

The vast amount of litigation which has occurred in California in connection with Spanish grants of land will be recalled; and the present clouds resting upon the titles to very great areas of land in the mountain region of the Southern States may be cited as an example of the condition to which the present system of conveyance of land may bring a portion of the country which has been occupied for a long period, but which has been very sparsely settled by a class of people who have been in the habit of adjusting their own disputes as to metes and bounds with the rifle and the bowie-knife rather than by well-recorded conveyances.

This great evil must be overcome. How can it be done?

The same kind of cloud may rest upon some titles even in the most densely occupied sections, where the valuation of land is very high.

The danger of defects in titles is now being overcome in some measure by the organization of title insurance companies. But these are private corporations, and while they may reduce the expense of conveyancing, may give a well-guarded and well-guaranteed title to the buyer of estates on which it would be unsafe to expend capital without a guaranty of possession, yet private corporations can merely palliate an evil which is growing everywhere, and which is a very great existing evil in some of the

most valuable parts of the United States long since sparsely settled, but now being occupied and developed according to modern methods.

It will become an absolute necessity for the States of Virginia, Kentucky, Tennessee, Alabama, Georgia, and the Carolinas to clear the title to much of the land in the mountain region of the New South and on the Piedmont and Cumberland plateaus, in order that the vast deposits of minerals, the great wealth of timber, and the immense natural capacity of the soil may be put to productive use, and may be safely and surely developed.

Whatever method of land tenure may be established, no person whose judgment is of any value can doubt the necessity of making it so certain as to promote and not to prevent the land being put to its most productive use.

Even where the communal system of land-holding still exists, of which the village communities in Russia are often cited as examples, the land is held in common, but only under such rules and regulations as will render the product secure to the individuals to whom its cultivation for the time being has been assigned by the commune.

The advocates of what is known as the "single tax" theory who have not become socialists sustain most fully the necessity of "legal ownership" of land and "peaceable possession" backed by the full power of the state. The private ownership which Mr. Henry George advocates is under conditions which may vary very much from the present conditions in the matter of taxation; but his proposed method of taxation is incapable of application unless, as he himself expresses his own views, the "legal ownership" of land and its "peaceable private possession" in distinct and separate parcels should be established and maintained by the state in exactly the same way that legal ownership and peaceable private possession are now assured.

Any doubt, uncertainty, or cloud upon the title to land which prevents the application of labor and capital to its development would be as inconsistent with the application of the single tax upon land valuation as it would be with the present method of obtaining a part of the public revenue by taxation upon land valuation; because no one will develop land either by applying to it the necessary cost of cultivation or of construction unless the title can be maintained in such a way as to assure a return upon the labor and capital expended. If the present taxes on land valuation are not paid by owners, it is sold to other private owners who will pay them. In this way the state already recovers the title to land and resettles it.

Not a mile of railroad can be laid down unless the state sustains the right of way vested

in the corporation; even if the state itself, acting as a corporation, should construct a railroad as towns and counties construct the highways, it must maintain its own title to the land taken for that specific use against its own citizens separately or collectively.

The success of the Torrens system has been so great in British Columbia as to lead to the organization of the Canada Land Law Amendment Association, to which many of the most prominent men in Canada belong, and at whose instance the registry of land titles may be extended throughout the dominion of Canada. In this country little attention has been yet given to this subject; but in some places, notably in the city of New York, it early attracted attention, mainly among members of the legal profession, who have been grappling with the increasing difficulty in the conveyance of land for several years.

The agitation has resulted, however, in the passage of an act by the State of New York to provide for recording and indexing instruments affecting land in the city of New York according to the "Block System," so called, and also an act to provide for short forms of deeds and mortgages. These acts are now enforced. They simplify the present methods of registering deeds, and they remove many other special difficulties which have rendered titles doubtful and conveyancing costly. But these acts fall far short of the simplicity and effectiveness of the Torrens method. They appear to have been framed mainly with a view to remedying legal difficulties in the practice of the existing system of conveyancing rather than substituting indefeasibility of title through the intervention of the State; they may therefore be considered only as preliminary steps to more effective measures.

The economic side of this question is the one which the writer desires to bring conspicuously into notice. His purpose is to call attention to the simple fact that in the practice of the English colonies *indefeasible and peaceable posses-*

sion and occupancy of land have been assured at the minimum of cost and by the adoption of the simplest methods of dealing therein. The small premium collected by the state as an insurance fund for its protection has become a large sum in every colony, in many colonies never having been drawn upon. That single fact may perhaps be accounted conclusive against all technical objections.

In order to adapt this system to the conditions of the several States of this Union, it will be necessary to bear in mind that the Australian colonies have been organized without written constitutions; hence it follows that many acts can be done by administrative authority which cannot be done in that way in this country. It is possible that in some States the application of this system might require slight changes in the written constitution. In Massachusetts it is probable that no constitutional amendment would be required, but that the whole system would be carried out under statute law creating courts of competent jurisdiction to deal with titles by adjudication, under formal notices of proceedings corresponding in many respects to those which are taken under the orders of the probate courts in dealing with land devised by will.

In a very large number of States in the Union proceedings may be had under orders of court which go very far toward clearing titles of which the deeds are registered, without requiring anything but a public or published notice to possible claimants who may not be within the State in which the land is, or within the actual jurisdiction of the court itself. A committee appointed by the legislature of Massachusetts is now (November, 1891) dealing with this matter. Doubtless before this article appears their report will have been rendered. It will contain the evidence given by many members of the Massachusetts bar in favor of the adoption of the system, together with *pro forma* acts carefully prepared to meet our present conditions.

Edward Atkinson.

SONG AND SINGER.

I SAW him once, the while he sat and
played —
A stripling with a shock of yellow hair —
His own rare songs, in mirth or sorrow made,
But tender all, and fair.

And as the years rolled by I saw him not,
But still his songs full many a time I sung,
And thought of him as one who has the lot
To be forever young.

Until at last he stood before mine eyes
An age-bent man, who trembled o'er his staff;
My sight rebelled to see him in such guise,
Ripe for his epitaph.

I grieved with grief that to a death belongs;
How Time is stern I had forgot, in truth,
And how that men wax old, whereas their
songs
Keep an immortal youth.

Richard E. Burton.

ORIGINAL PORTRAITS OF WASHINGTON,¹

INCLUDING HITHERTO UNPUBLISHED PORTRAITS OF GENERAL
AND MRS. WASHINGTON AND NELLY CUSTIS.

THE DE BREHAN MINIATURE OF WASHINGTON.
(ORIGINAL IN POSSESSION OF MRS. F. T. MOORHEAD.)

THE centennial celebration of the inauguration of Washington as the first President of the United States and the exhibition of personal memorials of him collected on that occasion, together with the several illustrated articles that have since appeared in *THE CENTURY* and other periodicals, have brought to light many interesting mementos of Washington and Mrs. Washington hitherto unknown except to the privileged few who were of the inner circle of the fortunate owners. The possessors of these invaluable relics are, however, ready to recognize that while the individual pieces remain their personal property, the interest in them and their enjoyment rightfully belong to the whole people.

To those previously brought out of their hiding and laid bare to the public eye can now be added several of no less importance belonging to Mrs. F. T. Moorhead, of Allegheny, Pennsylvania, who has inherited them in direct succession from Martha Dandridge, the widow of

Daniel Parke Custis, who, January 6, 1759, became the wife of Colonel George Washington. As is well known, Mrs. Custis had two children, a daughter named for her mother, who died in 1773, when just budding into womanhood, and a son, John Parke Custis. The son married, when a mere youth, Eleanor, daughter of Benedict Calvert, a lineal descendant of Lord Baltimore, and dying while he was with his stepfather before Yorktown, left three daughters and one son. The two younger children, Eleanor and George Washington Parke Custis, were adopted by Washington, and the two elder, Eliza and Martha, became the wives respectively of Thomas Law and Thomas Peter. Mrs. Peter had three daughters, whom she named Columbia, America, and Britannia Wellington. America married Mr. Williams, and one of her daughters became the wife of Rear-Admiral John H. Upshur, whose daughter is Mrs. Moorhead, sixth in lineal descent from Martha Washington.

While all personal memorials of Washington are fraught with great interest, those that hand down a portrayal of his noble lineaments as they were revealed to the minds of the many artists who sought thus to immortalize themselves are without doubt the most important. With this article are given reproductions of three of these original portraits, each in profile, and taken at different periods. The earliest one, by the Marchioness de Brehan, is among the treasures belonging to Mrs. Moorhead, to whom we are indebted for the privilege of reproducing it, the exact size of the original, while the skill of the engraver has preserved its character with the utmost fidelity.

The Marchioness de Brehan was the sister of the Count de Moustier, who succeeded the Chevalier de Luzerne as minister from France to this country. She was a woman of marked eccentricities, and was accomplished both with her pen and with her pencil, and in the autumn of 1788 accompanied her brother on a visit to Mount Vernon. While there she persuaded her host to give her a sitting "to complete a miniature profile which she had begun from memory, and which she had made exceedingly like the original,"—as Washington records in his diary, October 3.

On the same occasion she painted a profile miniature of Nelly Custis, then in her tenth year, which is particularly interesting from the

THE DE BREHAN MINIATURE OF NELLY CUSTIS.
(ORIGINAL IN POSSESSION OF MRS. F. T. MOORHEAD.)

from the fact that Washington writes to her brother, the Count de Moustier, November 1, 1790, acknowledging the receipt of his "letters of the 11th of May and 12th of July last, together with the flattering mark of your and Madame de Brehan's regard which accompanied the former." This flattering mark of regard was some proof impressions from a copperplate of the profile engraved in Paris; and Washington emphasized the guinea stamp he had already given in his diary to the correctness of the likeness by presenting these proofs to several of his friends. One of them went to Mrs. Robert Morris with the autograph inscription: "The President's compliments accompany the enclosed to Mrs. Morris."

Among Mrs. Moorhead's mementos are a small silver cup used by Washington throughout the Revolutionary war as a wine-glass, with the Washington crest engraved upon it; a heart-shaped locket containing on one side the hair of Washington and Mrs. Washington and of her four grandchildren, with the cipher "W. C." (Washington-Custis) in gold, and on the other side the initial "S" with the hair of Mrs. Washington's daughter-in-law and several of her children by her second husband, Dr. David Stuart; also, a miniature of Mrs. Washington, by Field, similar to the one belonging to Mrs. Moorhead's great-aunt, Mrs. Britannia W. Kennon, reproduced in *THE CENTURY* for May, 1890. Mrs. Kennon's collection has been freely drawn from on a previous occasion, but we are permitted through her courtesy to give two illustrations of exceeding interest never before made public.

When Charles Willson Peale painted his first portrait of Washington, at Mount Vernon, in the spring of 1772, he painted a miniature of Mrs. Washington for her son, then a youth of eighteen, for which Washington, as his guardian, paid ten guineas, the receipt for which, dated May 30, 1772, in Washington's handwriting, signed by the artist, is still in existence. Mrs. Washington was at that time in her fortieth year, and allowing for the greater youthfulness always appearing in a miniature by reason of its delicacy and minuteness, I have no hesitation in placing the illustration at this period and the work as that of the elder Peale. I re-

thoughtful character of the features, quite unusual in a girl so young. The two profiles are framed back to back, with a gold band, as a medallion, and are painted upon ivory in monochrome, water-color, very light in treatment, upon a background originally dark blue, but changed by time to a chocolate brown. When the writer's article under the same title appeared in *THE CENTURY* for April, 1889, the whereabouts of this original, which was reputed to have been painted upon copper, was unknown, and its discovery is very gratifying.

Madame de Brehan is said to have made several replicas of her profile of Washington with more or less variation, in one of them the profile of Lafayette being accolated behind that of Washington. This last-mentioned belonged, in 1848, to the master of Arlington House. That she took one home with her to France when she returned the next year is assured

AUTOGRAPH PRESENTATION OF THE DE BREHAN PICTURE.

cently had the privilege of examining critically this artistic and historic treasure, and the artist's signature is clearly found in the drawing, color, and general treatment. The eyes are grayish-blue and the hair dark-brown, slightly powdered in front. The dress is a delicate lilac, with rich white lace about the neck, fastened by a butterfly pin. A white lace veil, caught in the back of the hair with pearl ornaments, hangs over the right shoulder, and around the neck is a row of pearls.

The miniature, the size of the illustration, is as fresh as though it were just painted, and the artist's reputation could safely rest upon it alone. It is exquisitely set in gold, richly chased, as a pendant. With it is mounted a portrait in enamel of John Parke Custis, the son for whom it was originally painted. How interesting it would be to know that the guardian subsequently acquired the miniature painted for his ward, and that this is the identical one that George Washington Parke Custis tells us Washington wore around his neck through all the vicissitudes of his eventful career until his last days at Mount Vernon!

The reproduction of this early portrait of Martha Washington seems to be an appropriate occasion to refute the statement of Mr. Moncure D. Conway, in the introduction to his recently published volume entitled "George Washington and Mount Vernon," that the well-known Woolaston portrait of Martha Washington is not a portrait of Martha, the wife of George Washington, but of his sister Betty, who married Fielding Lewis. Mr. Conway says:

It is one of the many curiosities of Washington portraiture that the portrait of Betty Lewis at Marmion (probably by Woolaston) should be going about the world as that of Martha, General Washington's wife. There are portraits representing Martha Washington at all ages, and it appears inconceivable that any one could discover a resemblance between her and the portrait published as hers in Sparks (I., p. 106), in the "Republican Court," and even in the centennial *CENTURY MAGAZINE* for April, 1889. How this delusion originated one can hardly conjecture.

The only evidence adduced by Mr. Conway in support of his assertion is a copy of the print from Sparks's "Washington," with the following inscription written over it by Lewis W. Washington:

This engraving is taken from the portrait of Betty Washington, only sister of the General, who married Colonel Fielding Lewis. One of the original portraits is at Marmion, the residence of the late Daingerfield Lewis, of King George County, Virginia, one other at the residence of the late Lorenzo Lewis, of Clarke County, Virginia, and one in my possession.

Against these statements two pieces of evidence can be presented which seem to be unanswerable and conclusive. The portraits of Betty Lewis and her husband Fielding Lewis, named by Lewis W. Washington as being "at the residence of the late Lorenzo Lewis," were both exhibited in New York at the Washington Loan Collection, in April, 1889, and at Philadelphia in December, 1890, when they were sold by Birch's Sons to Mr. Charles Gunther of Chicago. On each of these occasions the writer critically examined the portrait of Mrs. Lewis, and in Philadelphia, in view of what Mr. Conway had written, paid especial attention to a comparison with the engraving of Martha Washington from Sparks. This com-

THE CHARLES WILLSON PEALE MINIATURE OF MRS. WASHINGTON.
(FROM THE ORIGINAL IN POSSESSION OF MRS. B. W. KENNON.)

parison showed satisfactorily that the engraving of Martha Washington from Sparks was *not* made from the portrait of Betty Lewis. The pose and the arrangement of the hair are very similar, but the crudely painted features, drapery, and points of detail are very different. The chief resemblance is in the handling, such as artists much more eminent than itinerant John Woolaston are not unapt to carry through their work. Particularly is this likely to be the case in portraits painted about the same time, and Martha Washington and Betty Lewis were probably limned together. As an illustration of the correctness of this remark many readers will recall how the portraits painted by Stuart about the time he was painting Washington are tinged with the General's characteristics. So much is this the case that Stuart's portraits of Thomas Willing and William Shippen are frequently taken for portraits of the Pater Patriæ, and that too not by the uninitiated.

This is the direct evidence on the sub-

THE WASHINGTON PLAQUE BY CHAMPION. (FROM THE ORIGINAL IN POSSESSION OF MRS. B. W. KENNON.)

ject. The circumstantial evidence is possibly stronger.

The portrait of Martha Washington in Sparks's work was published in 1837. It is inscribed "From the original picture by Woolaston in the possession of G. W. P. Custis, Esq., Arlington House." At this time Lawrence Lewis, Washington's favorite nephew, the son of his sister Betty, was living at Arlington House with his wife, Eleanor Custis, the granddaughter of Martha Washington, by whom she had been reared. Is it to be believed that George Washington Parke Custis, Martha Washington's grandson, with whom he had lived from

his infancy to her death, would give Sparks a picture to publish as a portrait of his grandmother in his possession, when it was not? Or that Lawrence Lewis would allow his own mother's portrait to be engraved and published as a portrait of his aunt and his wife's grandmother? Or that he did not know his own mother's portrait? Or that Eleanor Custis Lewis would quietly stand by and allow her husband and brother to perpetrate such an ignoble fraud upon the nation? Such propositions are too absurd for serious consideration, yet they must be accepted, just as here stated, before Mr. Conway's iconoclasm can avail.

THE JAMES PEALE WATER-COLOR OF WASHINGTON.
(FROM THE ORIGINAL IN POSSESSION OF MR. CHARLES HENRY HART.)

When I visited Mrs. Kennon at her noble old mansion, "Tudor Place," Georgetown, D. C., I was irresistibly attracted by a deep oval frame in one corner of the drawing-room, and an inspection revealed the beautiful relief plaque in pure white porcelain which is shown on another page. I recognized it immediately as a companion to a similar plaque of Franklin, by Richard Champion, that had been sold, as once the property of Washington, in the Philadelphia sale of 1890 with the Lewis portraits. Another, that had belonged to Franklin himself, was exhibited by a descendant at the Washington Loan Collection, and a third is in the Edkins Museum at Bristol, England. This last Mr. Owen engraves in his "Two Centuries of Ceramic Art in Bristol," and says, "Champion's admiration of Franklin evidently impelled him to produce this elaborate work, which is the most important one that has been preserved to us." He then fixes 1778 as its date,— "the best period

of the Bristol works." But the Washington plaque discovered by the writer is a much more important and elaborate work than the Franklin, and, as it is heretofore unknown and undescribed, it is probably unique.

The portrait is evidently after Peale's picture of 1777. Above the medallion are the emblems of the revolted colonies, liberty cap and rattle-snake, crowned by a coronet with thirteen points, for the thirteen original States, each point capped with a star. Beneath the emblem is the shield of the Washington arms, and around it the flags of the Congress are festooned. When we remember that this was made in England by an Englishman during the heat of the war, his daring and friendliness must elicit our homage and our admiration.¹

These plaques have a history as interesting as their art. They were the product of the famous china-factory in Bristol, England, started by Richard Champion in the year of the pas-

¹ Mrs. Kennon writes to the editor concerning this plaque:

"All I can tell you about it is that it is a relic from Mount Vernon. It was brought from there by my

mother, after the death of my grandmother, Mrs. Washington, and later was given to me. I more than once asked her if she could tell who it represented, and she always said she could not."

THE ST. MEMIN PORTRAIT OF WASHINGTON. (FROM A PHOTOGRAPH IN POSSESSION OF MR. CHARLES HENRY HART.)

sage of the Stamp Act. Champion was a firm friend of the colonies, and in the early days of the struggle with the mother country kept Robert Morris, who was his business correspondent in the middle colonies, fully and regularly advised of the movements and operations of the British Government. He doubtless made these plaques and presented them to Washington and Franklin as a mark of his esteem for their characters and of his deep interest in the

cause in which they were engaged; for the production of these elaborate and important pieces, eight and three quarter inches by seven and one eighth inches, could never have been undertaken for profit, the actual trade cost of the most simple ones being more than five pounds each. One of these minor flower-plaques is in the writer's cabinet. They are wonderful examples of the application of hard porcelain to works of great delicacy and beauty; for it will be un-

derstood that the entire design is in relief, the flowers being skilfully modeled with botanical accuracy.

Champion was one of the leaders in the movement caused by the political exigencies of the time, and was foremost in the strife in Bristol toward the close of 1769. He nominated Burke for Parliament at the famous election in November, 1774, which resulted in the return of Cruger and Burke, and the greatest work of his factory was the tea-service he made and presented to Mrs. Burke in commemoration of her husband's return as member for Bristol. The tea-pot of this service has been sold for £210, the milk-jug for £115, and a cup and saucer for £90, realizing the value of their weight in pure gold. The china-factory was not a financial success, and Champion abandoned it and left Bristol, November, 1781. The next spring Burke, upon being appointed paymaster-general by Lord Rockingham, named Champion as his deputy, and he held the office until the collapse of the ministry in 1784. Late in that year Champion sailed from England for South Carolina, where his brother-in-law, Caleb Lloyd, resided and had held the obnoxious office of stamp-distributor. He settled in Camden, became a planter, and was naturalized, and there he died October 7, 1791, the seventh anniversary of his sailing for America. The De Saussure family of South Carolina are his descendants, his only grandchild having married the only son of the eminent Chancellor De Saussure.

The remaining illustrations will be dismissed in a few words.

James Peale, a younger brother of Charles Willson Peale, was a very superior miniature-

painter, excelling his elder brother in this branch of the art. He painted Washington at least three times, and possibly four times, from life. The last sitting was in 1795, when Charles Willson, his young sons Raphael and Rembrandt, and his brother James all painted Washington at the same time. Three sittings were given, and the profile engraved for this article is the result of one of them. It is painted in water-color upon a small piece of paper, and only the face is finished; but for repose and placid, quiet dignity it is unequaled by any other portrait of Washington. The writer feels himself fortunate in the ownership of this charming drawing.

The last known original portrait of Washington also accompanies this article, and the outline of the profile must be true to life. It was made with the physionotrace at Philadelphia in November, 1798, by C. B. F. de St. Memin. The outline, the size of life, was produced upon pink drawing-paper and then finished in crayon. From this drawing a reduced profile of any desired size could be obtained by the use of the pantograph, and St. Memin's chief business was to reproduce profiles on copper, in a circle of two inches diameter, from which prints were made, and which were the *carte-de-visite* photographs of the end of the last century. The head of Washington he, however, reduced to a very much smaller size, and used the impressions for commemorative mourning-rings after Washington's death. The original drawing, excellently rendered in facsimile from a photograph, did belong to Mr. J. Carson Brevoort of Brooklyn, but since his death, a few years ago, no trace of it can be found.

Charles Henry Hart.

HEART OF HEARTS.

WILL you come to my heart of hearts? 'T is a path o'ergrown with rue,
Where rarely a footprint parts the mosses or dims the dew;
Yet there in the thorn tree cloven her nest hath a song-bird woven,
And deep in my heart of hearts the love-lights burn for you.

Would you wend from my heart of hearts? Shall I hold my guest my thrall?
Peace to the rose that starts wherever your footsteps fall!
But leaping in fitful flashes, the hearth-fire pants to ashes,
Shadow on bench and ingle, shadow on floor and wall.

All dark in my heart of hearts? Nay; we deemed the skies too far,
When we builded with rustic arts a roof for the storm to mar.
Only the wind at the latches, but in through thy broken thatches,
O shrine in my heart of hearts, gleams a glory-tinctured star.

MONSIEUR ALCIBIADE.

BY THE AUTHOR OF "THE ANGLOMANIACS," ETC.

TRANSPARENTLY gentle despot, who might have been led by the finger-tip of the youngest member of his class, was M. Alcibiade de St. Pierre, the Belhaven dancing-master, who gave also lessons in his native tongue. Nature had endowed him with a stationary scowl, his mustaches curled wildly, and he bore upon the brow a cicatrix that caused his pupils to liken him to the swashbuckler heroes of Dumas, Scott, or Cervantes. In outward appearance he was Aramis, Athos, Porthos, and D'Artagnan in one, with a dash of Le Balafre and Don Quixote thrown in.

Although this picturesque personage was a comparative newcomer in the town, the forebear of M. Alcibiade had arrived in America as pendant to an expedition supplying an interesting chapter of colonial history. Early in the spring of 1790 came into port at Belhaven a party of French immigrants engaged by Playfair, an English agent, and De Soissons, a nimble-tongued deceiver of his compatriots, in behalf of an enterprise organized in New England, and styled the Ohio Land Company, to people the wilderness near the mouth of the Kanawha River, beyond the western woods of Virginia. Among the travelers, whose weary hearts beat high with hope as they touched the shore of a fancied El Dorado, were men skilled in the exquisite handicrafts of a perfected civilization. Carvers there were of furniture like wooden lacework; beaters of fine brass fashioned into *rocaille* decorations; painters of shepherds piping to their fair, of Cupids turning somersaults in chains of roses; harpsichord-tuners; makers of gilded carriages; varnishers of panels that shone like mirrors; disciples of Boule and Martin; confectioners; perruquiers—and all, by a fine irony of fate, bound for a log-hut settlement, where the cry of savage beasts, or the war-whoop of the deadly Indian, was to be their nightly lullaby.

What eloquence had prevailed upon these hapless beings to believe they were to be the founders of a brave new Paris in the western hemisphere, their wily managers alone could tell. The first instalment of the five hundred Frenchmen said to have been thus deluded, numbering with their wives and children about sixty, after much waiting at Belhaven, their souls within them vexed by homesickness and hope deferred, split up into variously minded factions. Some pressed on, under charge of a long-delayed messenger of the company, to the

frontier; others put their all into a return passage to France; and a few elected to remain and try their fortunes in the little town which in those days had no end of ambitious projects for future greatness.

One of these prudent ones was a gay old bachelor, Alcibiade St. Pierre, self-styled "Hair-Dresser to the Court of France." He opened a snug little shop, where the gentry of town and country dropped in to have their perukes dressed and tied, to be shorn, perfumed, and shampooed, after the latest fashions in vogue before Alcibiade had set sail for the New World. He was sometimes sent for to bleed, or to apply leeches, and his *mille-fleurs* graces impressed the townspeople mightily. As his trade increased, Alcibiade was called on to lament the sad fortunes of his fellow immigrants. Most of those who became frontiersmen had succumbed to want and hardships, had met the horrors of Indian massacre, or had gone under in the collapse of an international speculation that carried down its promoters in the crash. From those who returned to France had come dolorous accounts of commotion in their beloved capital. Decidedly, thought M. Alcibiade, it were better to stagnate in Belhaven than be forced by a mob in Paris to dress the head of some former patron upon a pike!

Simple-minded, kindly, cheery as *le petit homme gris*, the little hair-dresser became a great favorite. A trig Scotch lassie, daughter of a settler, having fallen in love with him, the father consented to the match on condition that the intended son-in-law would renounce his French patronymic and translate himself into plain "A. Peters" upon his sign and in his official signature. And thus it came to pass that, instead of the stylish frontispiece so flattering to town pride, there arose above the shop door an announcement remaining there until its blue and gold were dimmed by time:

A. PETERS, LADIES' AND GENTS' HAIR-DRESSER AND BARBER.

And, farther down:

WIGS AND TOUPETS.
DISEASES OF THE SCALP.
ONGUENTS AND SCENTS.

HAIR-POWDER, ROUGE, AND PATCHES.
ATTENDANCE AT HOUSE FOR BALLS AND
ROUTS.

Also:

TEETH PULLED, AND LIVELY LEECHES
CONSTANTLY IN STOCK.

By the smiles and blushes of his buxom bride the gallant Alcibiade considered himself well paid for his self-sacrifice. Continuing to prosper, he gave hostages to hair-dressing in the shape of several little lads who spoke English with a broad Scotch burr, French not at all, and, later in life, seized with nostalgia, emigrated with his family to end his days on the soil that gave him birth.

Old Mr. Peters had become a figment of tradition in the town when his grandson, the present Alcibiade, appeared upon the scene. To the ancestral St. Pierre the new representative had prefixed a patrician "de," vaguely explained as having been resumed by the family on recovering possession of estates lost in the French Revolution. To plain people in Belhaven this prefix was interpreted to be an initial letter D, doing duty for a middle name not given. As for the estates, they must have been limited to the amount aptly if not elegantly designated by the French Commandant Marin in the conference with the Half-King of the Six Nations, recorded by Washington in 1753, when he said, "Child, you talk foolish; there is not so much land as the black of my nail yours."

When first arrived in Belhaven, the poor Frenchman was indeed in a pitiable plight. The attention of the town was called to him by certain readings and recitations in his own language, advertised to be given in Lafayette Hall.

Gay Berkeley, who, with her maiden aunt Penelope, had gone into Mrs. Dibble's shop to purchase pens and writing-paper, picked up from the counter a document in manuscript that excited her amused curiosity. It was apparently a program, written on foolscap in a fine copperplate hand, and expressed in a queer French-English that would have been a credit to the manual known to fame as the "Portuguese Grammar and Guide to Polite Conversation."

On my arrival from the France, me Alcibiade de St. Pierre, Chevalier of the Legion of Honor and ex-artist of the theaters of Paris, do make hurry to throw myself at the feet of illustrious citizens of Belhaven, with a presentment special of selections from the immortal Racine et Corneille, such presentment to have place Hall Lafayette, the Monday evening to follow. Receive, ladies and gentlemen, my distinguished homages and impressed salutations your very humble serviteur.

"What in the world is this, Mrs. Dibble?" asked the young lady, with dimpling cheeks.

"Indeed, Miss Gay, I told the Chevalier that it would n't be long catchin' the eye o' my best customers," responded Mrs. Dibble,

complacently. "I helped him out a bit with the words he did n't know. Dear heart, if it was n't only but for the handwritin', as good as Mr. Johnson's nephew that was put in State's prison for forgery, pore fellow, he that used to practise here with fine nibs an' broad nibs, writin' cards—spread eagles with your name in curlicues comin' out o' their beaks—an' true-lovers' knots an' doves, if 't was a new-married pair. Miss Penelope, I 'm ashamed to say I 'm clean out o' quills; but old Farmer Berry up at the cross-roads, the only one I can trust to pick the geese properly, 'll bring me a new lot to-morrow. Miss Gay, now, she 's new school, 'n uses steel—sand, ma'am? Yes; of course. The usual quantity? Here 's sweet note-paper, Miss Gay, just received from Baltimore, the tip o' the mode, they say—pale pink an' skim-milk blue. Plain white, did you say, miss? Yes; I 've some cream-laid, like you 've always used befo'. If you 've nothin' better to do, ladies, 't would be a charity to that pore Mounseer to patronize his performance a Monday night. If 't was only for old times' sake, Miss Penelope, ma'am; many 's the head he 's dressed—I mean his grandfather's dressed—for your fam'ly. Yes; old Mr. Peters's grandson, as I 'm alive, ma'am, an' the entertainment most genteel. Selections from Corneel an' Raycine; fifty cents for adults, twenty-five for children, an' a special reduction for ladies' schools. I thought there 'd be a chance to get the young gentlemen from Mr. Penhallow's Academy; but the Chevalier kinder shriveled up at the mention o' boys, an' said 't was too hard to keep up the true dignity o' the drama when they was present—Lord knows, since I took to keepin' sweet stuff in t' other winder, I 'm up to the ways o' boys. If it 's only a penny horse-cake—comin' back as bold as brass, with the hind legs eat off, declarin' they 's found a dead fly instead o' a currant for the eye, an' wantin' their money or another cake—"

"Do take some tickets, Aunt Pen," pleaded Gay.

"You know my sister does not approve of anything theatrical, my love," whispered Aunt Penelope. "Most of our church-members think with her. To be sure dear mama used often to tell us of the time when General Washington and his lady, and Miss and Master Custis, drove up to stop two nights at grandpapa's, expressly to attend 'The Tragedy of Douglas,' by Mr. Home, and a play called 'The Inconstant; or, The Way to Win Him.' Mama saw all the entertainments of the kind, I believe. It was thought of differently in those days."

"Doctor Falconer," ventured Gay, mentioning an eminent divine, "quoted, when he last drank tea with us, a passage from Racine. And

these are only recitations, auntie, no acting or costumes."

"Oh, in that case," said Aunt Penelope, taking out her purse, "you may give me four tickets, Mrs. Dibble, and you may invite two members of your French class, child. Seats in the second row, if you please, Mrs. Dibble. In a thing of this kind it is well to be near enough to study the expression of the performer's face; and one likes to forget the crowd when it's poetry. I'm sure sister Finetta will be pleased to hear about old Mr. Peters's grandson."

Lafayette Hall was a dingy, ill-lighted room over the second floor of the building in which Mrs. Dibble kept her shop. To the young people it was associated with the intermittent delights of performances by trained dogs and canaries; by Blind Tom, a negro pianist who could repeat every air suggested to him by the audience, and play better with his hands behind him than most of his hearers in the natural attitude; by the tuneful Hutchinson family, who stood in a row and warbled; by jugglers always interesting, and returned missionaries less alluring to the young; of May exhibitions of female seminaries, whereat the pupils in book-muslin with arbor-vitæ wreaths recited before applauding parents poems in honor of their queen, and were afterward regaled with lemonade and cake. It was there that Gay, as first lady-in-waiting, had once retired behind the queen's throne in tears, because her majesty had not scrupled to twit her with wearing one of Aunt Pen's muslins "made over"—which was too true.

Even now Gay could not divest herself of the exhilaration produced by the sight of that green baize curtain and the oil-lamps serving as footlights. When, on the evening of the Chevalier's *début*, she came into the hall, she nodded on every side to her friends, with a feeling that this was life. Mrs. Dibble, whose person was attired in grass-green *mousseline de laine*, with a wide collar of dotted net, trimmed with cotton lace, took tickets at the door; and in a conspicuously good seat sat Viney Piper, the little day-dressmaker, whose passion for the drama led her to patronize every respectable show that came to town. Viney had arrived upon the opening of the doors at six o'clock, and the performance was advertised to begin at half-past seven. She was an odd-looking, albino sort of creature, with pinkish eyes and eyelids, pale flaxen hair, and a hook-nose much to one side of her face. The Chevalier, entering the hall, had caught sight of her on his way to the rear of the stage, and forthwith executed a sweeping bow that Viney thought the perfection of foreign elegance.

When the hall was fairly filled, and the shuffling of feet announced the right degree

of impatience on the part of the audience, the curtain, pulled up by the performer himself, rose upon a stage empty save for a small pine table displaying a white china water-pitcher and a goblet. M. Alcibiade, wearing a suit of rusty black, with a scarlet satin stock and white kid gloves, an order in his button-hole, his hair fiercely ruffled, and his eyes gleaming at some foe unknown, holding a dinner-knife in his clenched hand, stalked on the scene. At this alarming apparition a little girl sitting by her mama burst into tears, and had to be consoled with gum-drops from the parental pocket, interspersed with audible assurances that the gentleman meant no harm. Opening his lips, Alcibiade poured forth a cataract of words, of which the most advanced French scholars in Miss Meechin's senior class could make neither head nor tail. He raved, he roared, he ranted; then seizing a goblet from the table, half-filled it with water, and, holding the dagger in his other hand, advanced to the footlights calling on Heaven to end his woes. At last, drinking the contents of the poisoned cup, he threw away the dinner-knife, and fell with a gurgling groan and a crash that made the lamps rattle in the chandelier. This, by agreement with Mrs. Dibble, was the signal for that worthy lady to hurry behind the scenes and let fall the curtain on the direful sight; but she, unfortunately, stood like a stock, averring afterward that her blood was that cruddled with awr she could n't 'a' budged a mite! Next, M. Alcibiade, coming slowly back to life, sat up to confront the audience with a smile of absolute fatuity; then scrambling to his feet, bowed, kissed his hand, and, going off, let the green baize descend on act the first.

It was long since Belhaven had enjoyed such a merry spectacle. The school-girls' leading off with infectious giggles, every bench caught the contagion, and only Viney Piper, mopping real tears from her eyes, announced herself a connoisseur of true art.

The rest of the program, although less explosive, met with hysterically suppressed mirth. Before its close, indeed, the audience had filtered slowly from the hall, leaving only the faithful Viney and Mrs. Dibble, the newspaper-carrier (who was stone-deaf), a scrub-woman with her baby in arms, and a few citizens who exacted their money's worth.

It was evident that provincial taste had not been educated to the dramatic standard of old Mr. Peters's grandson. Alcibiade, failing in other occupations, sank from poverty to want. One day when Miss Viney Piper, arriving at the Berkeleys' house in Princess Royal street, had established herself in the sewing-room, the ladies in submissive attitudes before her, the

little dressmaker could hardly wait to dispose of business before introducing the subject near her heart.

"Just keep on running up them skirt-widths, Miss Gay; an' Miss Penelope, ma'am, you could be gofferin' that sleeve while I get the body ready to try on," she said, marshaling her forces like a general in command. "Did you hear the news—that old Mr. Peters's grandson ain't expected to live the day out? Fairly starved, I reckon, 'fore he 'd let Mrs. Dibble know, an' he sleepin' in a hole of an attic at the Drovers' Hotel—kinder low fever, nothin' catchin', the doctor says, but nothin' to bring him up again. Such a beautiful genius he is, ma'am, an' a temper like a child, for all he looks so fierce."

"Starving! What do you mean, Viney?" said Miss Penelope, excitedly. "Go, Gay, fetch me my bonnet and mantilla, and help Susan to pack a basket with some things. How comes it that nobody knew?"

"It's all right for the present, Miss Penelope, ma'am," said Viney, blushing. "That's what's kep' me a little late this mornin'. I took up a few trifles, an' Mrs. Dibble she's got somebody to mind the store, and is to stay with him all day. But if you 'd let Peggy put on a chicken to boil down for jelly, it would n't be wasted if—" here she swallowed once or twice and stabbed her pincushion—"if the pore Mounseer can't make no use of it."

The "pore Mounseer," however, surviving the day under Mrs. Dibble's kindly care, and finding no lack of nourishment during the days that followed, was, with the assistance of a subscription among some charitable people, transferred in the course of a week to a spare room let to single gentlemen by Mrs. Piper, Viney's mother, which by happy accident had been recently vacated.

The Pipers lived in one of the small frame-houses built to open directly upon the moss-encircled bricks set diagonally in the ancient sidewalk of a modest street. Their door-stone of white marble was accounted in the neighborhood a badge of distinguishing elegance, as was also a small brass oval serving as a bell-pull, when most people used knockers, or "knuckles," the gossips would aver. The late Mr. Piper had been a seafaring man, and had risen to be first mate of the brig *Polly and Nancy*, when, on a return voyage from Cadiz with a cargo of fruit, salt, and wines, bound for Belhaven port, he was swept overboard in a hurricane and lost.

The best room of the little house, into which one stepped out of the street direct, was a sort of marine museum like a chill grotto, suggesting a mermaid's clutch or the grip of shark's teeth. Here Mrs. Piper did not care to raise

the shades, except at one side window permanently darkened by a trellis overgrown with a vine of the Isabella grape. The children of Miss Viney's customers liked to be sent to make appointments with that busy little body; for Mrs. Piper, too deaf to answer questions, and droning her explanations in a sing-song voice, always showed them around the museum with great affability. The old woman usually sat in a clean kitchen opening upon the back yard, where, under the damson-trees and amid the hundred-leaf rose-bushes, were constructed little winding walks, edged with shells, and leading up to seats made of a whale's backbone.

After the Chevalier de St. Pierre had succeeded in obtaining classes in dancing and deportment that enabled him to live, and had settled down to become a fixture in the widow's house, his spare moments were given to cultivating flowers in the beds between the shell-bordered walks. Everything grows easily in soft Belhaven air, and soon the Pipers' garden became a proverb in the place. Mrs. Piper's only complaint against her lodger was couched in the expressive phrase, "The Lord knows how often he empties his water-jug"; but even a distaste for ablution yielded in time to the insistent cleanliness of his surroundings. Sometimes, to cheer "Madame Pipère" in her solitude, Alcibiade would descend to the kitchen and proffer to the old woman, knitting in her sunny window-seat, "a leetle divertissement from ze classique drama of La France." He had a *vrai* inspiration for the stage, St. Pierre confessed to Viney, and but for political intrigue would be now in his rightful place on the boards of the Théâtre Français. These exhibitions, repeating the celebrated performance of his début at Lafayette Hall, were as deeply and religiously admired by the widow as by her daughter.

One day occurred a variant upon the usual exercise. Alcibiade had always treated poor lank Viney as if she were one of the great ladies of the court in bondage to his ancestor's curlingtongs; but she was unprepared for the scene that greeted her return when, having stepped down to Slater's for a spool of "forty" cotton, she found the Chevalier, in his best black suit, wearing white kid gloves, and holding a bouquet in one hand, kneeling at Mrs. Piper's feet and kissing her finger-tips with reverence.

"I ask you, madame, for the hand of your beautiful and admirable child in marriage," was what Viney and the whole neighborhood within ear-shot heard him roar.

Viney, with all her good qualities, was a bit of a virago. The absurdity of the proceeding, and the sense that her adjacent acquaintances were laughing at her affairs, flooded her thin skin with blushes, and her soul with anger. While Mrs. Piper, scared out of her wits, was

about to open her lips for a feeble screech, Viney whisked into the kitchen, snatched Alcibiade's bouquet, threw it away into a parsley-bed, and boxed the professor's ears.

"You 'd better believe I give 'im a piece of my mind," she narrated afterward to Miss Penelope and Gay. "But, bless you, he cried so pitiful, an' begged our pardons so kind o' honorable, I had not the heart to turn him out o' the house like I threatened to. Them white kids, Miss Gay! An' at his age, an' mine! The notion's too cryin' ridic'ulous." And she snapped a seam into the beak of her sewing-bird with vicious emphasis, giving at the same time a sidelong glance into the mirror, and a complacent toss of the head.

No one could be long in the Chevalier's company without discovering that a very dove of gentleness and affectionate gratitude dwelt in his gaunt envelop of flesh. So, restraining his pretensions as a lover, he meekly accepted Miss Viney's fiat, and went about the town looking as warlike as ever, but inwardly carrying a broken spirit. One of his dancing-class encountered him crossing a windy common in the suburbs of the town pursued by a flock of geese, from whose sibilant obloquy he was making nervous efforts to escape; and it was known to the boys and girls that the Chevalier was always alarmed by the apparition of a spider or a cow. No wonder the young people decided that Alcibiade had been reduced to pulp by Miss Viney's vigorous rejection of his suit. The little dressmaker's peppery temper was familiar to the offspring of her customers, from whom she would stand no trifling around her temporary throne in their respective households.

When the war between the States broke out, Viney seemed to have found her destined vocation as a red-hot secessionist. Not very clear, fundamentally, as to what she resented on the part of the national authorities at the other end of the Long Bridge, some eight miles away, she threw out her rebel banner on the wall, sang "Dixie" in her shrill treble, declaimed, protested, and, in short, kept everybody in her vicinity in a boiling state of excitement about the condition of political affairs. When the Belhaven regiments went on to Richmond or Manassas, Viney stitched her fingers to the bone making shirts for them, while Mrs. Piper knit socks of gray wool as fast as her needles could fly. They also turned out a number of the white linen havelocks and gaiters adopted by one of the companies and afterward discarded as a too shining mark for opposing riflemen. Viney trotted to the train to see the boys go off, and stood there in the crowd, cheering and waving with the best. As she watched the last car recede on two gleaming lines of steel, its rear platform thronged with gesticulating

shapes in gray, she felt her heart inflate and her stature grow with a yearning desire to go out and fight or do something helpful in their ranks.

When she turned to walk home that afternoon of balmy spring, there, haunting her footsteps, was the faithful Alcibiade. He looked into her watery blue eyes as if imploring to be allowed to speak his sympathy.

"Have it out, an' be done with it, for gracious sake," said Viney, pettishly. His smooth-finished black coat, his waxed mustache, the bunch of jonquils in his buttonhole, fretted her beyond endurance.

"Those tears for the brave they are a benison," said Alcibiade, sentimentally. "Who would not be inspired by them to deeds of glory?"

"It 's not the boys I 'm cryin' for," said Viney. "It 's us that are left behind and have got to put our necks under the vandal's heel." That "vandal" afforded a famous outlet for secession wrath in those days; it may be doubted whether the war could have been carried on without him. "Oh! if 't worn't for mother, d'ye think I'd stay? I'd go to-morrow, an' carry a water-pail to fill canteens; or I'd nurse in hospitals — or anything."

"It is a noble, a sacred cause," replied the Chevalier, looking down at the toe of his varnished boot to avoid the needle-point of her eye. "You will permit me, *chère* Mees Viney, to mingle with yours my prayers for its success? When I think that this Virginia that has sheltered two exiles of our house — my ancestor, who came here to find a home, a bride, a thousand friends, a thousand tendernesses; and me, less fortunate, but ever grateful for the hour that brought you, an angel of goodness, to my rescue in distress —"

"That 's neither here nor there," interrupted Viney, cruelly. "Besides, it was as much Mrs. Dibble as me, anyway."

"But you will not deny me the privilege of sharing your patriotic anxiety for the welfare of the troops? You will allow my heart to beat in unison with yours?"

"Nobody ain't a-preventin' your heart doin' what it pleases," said the uncompromising lady of his love, now fairly out of patience with his phrasing. "But it 's deeds, not words, that show what a man 's worth nowadays. When I think what a fool I used to be 'bout fine talkin', an' how I believed if a feller spread himself in speechifyin' he was boun' to be a hero, it makes me fairly sick. I'd rather have the little finger o' one o' them privates that 's in the train we hear whistlin' up yonder — bless their souls! — than the whole body of a dandy Jim that stays at home. But, law me! I 'm foolish talkin' such stuff to *you*."

Foolish and manifestly unjust, we will agree with her. But Viney's seed was not sown upon barren soil, as we shall see. From that date the Chevalier's mustaches lost their jaunty curl, his eye its martial fire. The dancing-school declining with the growth of military rule in town, his occupation was chiefly to walk along the streets picking up such rumors and crumbs of gossip about the movements of either army as might bring a spark of interest into the orbs of Miss Viney on his return to the widow's house.

The days of June wore on, and Viney's temper, taxed by anxiety about the issue of the approaching battle, became more tart, her taunts more frequent; but the Chevalier suddenly seemed to take heart and to walk with a firmer tread. One night he did not return to sleep in his tidy bedroom, and Viney, going into it, found a letter addressed to herself upon the table.

Adieu, my benefactress, beautiful inspiration of my unworthy life [the Chevalier had written], I fly to win the approval of your noble tears or to sleep eternally upon the soldier's bloody couch. To you, in this supreme moment, I dare avow a truth for which my manhood does not blush—that I have, until now, held back because of a weakness of temperament that made my soul blanch at thought of the soldier's baptism of fire. Now that the struggle is over, I am resolved to ally myself with the armies of the South, that has given me a shelter, and given me you, adored one, whose hand I embrace in spirit, with that of your respected mother; to whom, and to you, the salutations the most distinguished of your all-devoted

ALCIBIADE.

"The land o' Dixie!" cried out Miss Viney. "If that pore creeter's in earnest I'll never draw a free breath till he gets back."

M. Alcibiade was very much in earnest. A few days later Miss Viney had a visit from a lawyer who informed her that the Frenchman, before going through the lines to enlist in the Southern army, had caused to be drawn up a will bequeathing to her some hundreds of dollars which by frugality and care he had saved during his residence beneath their roof. Viney had an honest crying fit after the lawyer left, and, putting on her bonnet, sped down to Princess Royal street to take counsel with the Misses Berkeley as to the best way of tracing the absent one and conveying to him some token of her appreciation and regard. Those ladies could give her little hope. They promised, however, to write recommending Alcibiade to the care and kind offices of their friends in Belhaven regiments, should the Frenchman find his way among his old acquaintances and pupils; and with this Viney was forced to be content.

After Bull Run, Manassas; and after Manassas, a breathing-space in which North and South held themselves in check, dreading to pierce the veil shadowing the future of the conflict. In the dusk of a warm summer evening, when Viney had carried out a bucket of fresh water with which to drench and cool the already clean bit of pavement appertaining to their front door, a country wagon with a hooded canopy of canvas, drawn by mules and driven by a long-legged rustic in a linen duster, wearing a broad straw hat, pulled up beside the curb. Inside was heard the cackle of resentful fowls. The driver, carrying a basket of eggs, leaned over and accosted her:

"No; I don't want anything to-day, I'm 'bliged to ye," began Viney—and broke down with a gasp. "Good Lord! It's you, Mounseer?"

"It is, charming Mees Viney," said the pretended farmer, with a warm grasp of her hand. "Hush! Not a word that the neighbors can overhear."

"But I don't understand; you are not in the army, after all?"

"There are ways and ways of being a soldier," he went on in a low whisper. "Believe me when I tell you I have kept my word. Take a few of these eggs and count them into a dish or basket—yes; your apron will do—that I may go on talking without fear. Then I will find it troublesome to gif you change."

"But where in the land did you come from?" she asked, burning with curiosity.

"*Ma foi*, from a Union camp, to-day, where the soldiers have left me little to sell to you, *belle dame*. To-morrow at daybreak—for I shall find fresh mules outside the town—I present myself to a general whom a Frenchman is proud to serve—ze peerless Beauregard."

"You are—you are—" she began, her face blanched, her teeth chattering.

"Never mind what I am; let me but look once more upon that face of which I so often dream, and then I must hasten away."

"Oh, go, go!" she pleaded. "It was perfect madness for you to come here. Not ten minutes ago a patrol of Yankee soldiers walked down this street."

"Bah!" he said, with a shrug, "have I not enjoyed the company of their compatriots all day? But for your sake I will go. Have no fear, *belle Viney*; you will hear from me again."

Was this the timid, the cringing Alcibiade, Viney asked herself all through a sleepless night. Many and many a night thereafter she was destined to toss and wonder as to his fate. In the autumn she had a line from him, left by a wood-seller from far up in the interior of the county; he was safe and well, and still in the service of the employer who retained him when

he had seen her last; and he was always her devoted and faithful A. de St. P.

After that a blank of long years extending to the close of the dreadful war.

Viney had given him up for dead, of course; had put on mourning and made her mother do the same; and everybody said how strange it was that Viney Piper should make all that fuss about a man that just walked out of her house one day and gave her the "go-by" without a word. She could never persuade herself to touch a penny of his bequest, but had consulted her confidante, Miss Penelope, about the propriety of using it for a fine monument to be erected to his memory in the Belhaven graveyard, when the correspondent of a New York paper, mousing around the old Virginia town for material, announced to the public that he had discovered the identity of the famous and daring rebel scout, Peters, who, after countless adventures, and escaping the noose a dozen times by a miracle, had disappeared from sight. This dashing character, it was confidently stated, was none other than a so-called French dancing-master, known at the time as St. Pierre, who had lived in Belhaven pursuing his harmless occupation for some years prior to the war.

In the comments of the press upon this announcement more than one reminiscence of Peters was soon given currency; and presently the editor of a journal in an obscure western town wrote to the New York paper that Peters, *alias* St. Pierre, *alias* no-one-knew-what beside, was then actually residing in the family of a charitable Frenchman of his locality, having survived a wound and an imprisonment that had left him helpless upon his benefactor's hands.

When this was published Viney's friends saw the little woman smile. Then she cried, then she fell down on her knees and thanked God

for his mercy, and lastly she packed her little trunk, and set off for Illinois.

"You have come to me, and I was too proud to bring the remains of me to you, *belle* Viney!" said Alcibiade, when she arrived. "It is enough for me to see you, to forget that prison where I laid so long."

Poor little, homely Viney was utterly overcome. She took his thin hand, with the claw-like fingers, and, stooping down, kissed it and cried over it.

"Lord, lay not this sin to my door!" she said, gazing on the wreck before her with a sudden, bitter self-reproach. "O Mounseer, tell me that you forgive me for what I drove you to, for I'll never forgive myself."

"Listen to me, Mees Viney," the Frenchman said, looking about him anxiously to see that no one overheard. "You have done for me what a thousand times, in peril of my neck, in cold, in hunger, in a prison cell, I have thanked you for—you have made of me a man! *Bon Dieu*, a man!"

Viney brought him back to the little chamber beneath the roof of Mrs. Piper's house, where the two women nursed him into comparative comfort; health he might never fully know again. In summer-time, his chair rolled out upon one of the shell-bordered walks, he would remain gazing in absolute content upon Viney sitting on the door-step with her work. In his eyes she was always beautiful; and when, with many misgivings, she one day consented to let Dr. Falconer, with Miss Penelope and Gay as witnesses, step into the grotto of marine curiosities and make her Madame Alcibiade, the ex-spy straightened up with something of his old dancing-master's grace.

"*Tiens!* I have won the flower of womanhood," he said. And so he thought to the last.

Constance Cary Harrison.

A TIRED HEART.

SOMETIMES I cry: "Oh, give my tired heart rest!

It is so weary of the throb and pain

Of loving, weary of the stress and strain

Of care for others. Pluck love from it, lest

It faint beneath the burden on it pressed;

As one takes work away from hand or brain,

Saying, 'Rest a little, then work on again;'

So take love from this thing within my breast;

Give it from all its struggle glad release;

Calm its wild beats; and soothe its restless cry!"

Then to myself my tired heart makes reply:

"O foolish one, should all my loving cease,

Thou wouldst have rest as clods and stones have peace,

Lifeless, inert—for without love I die!"

Bessie Chandler.

THE NAULAHKA.¹

A STORY OF WEST AND EAST.

BY RUDYARD KIPLING AND WOLCOTT BALESTIER.

IX. (Continued.)

KATE saw little of Tarvin during the next few days. Mrs. Estes made her known at the palace, and she had plenty to occupy her mind and heart. There she stepped bewilderedly into a land where it was al-

ways twilight—a labyrinth of passages, courtyards, stairs, and hidden ways, all overflowing with veiled women, who peered at her and laughed behind her back, or childishly examined her dress, her helmet, and her gloves. It seemed impossible that she should ever know the smallest part of the vast warren, or distinguish one pale face from another in the gloom, as the women led her through long lines of lonely chambers where the wind sighed alone under the glittering ceilings, to hanging gardens two hundred feet above the level of the ground, but still jealously guarded by high walls, and down again, by interminable stairways, from the glare and the blue of the flat roofs to silent subterranean chambers hewn against the heat of the summer sixty feet into the heart of the living rock. At every step she found women and children, and yet more women and children. The palace was reported to hold within its walls four thousand living, and no man knew how many buried, dead.

There were many women,—how many she did not know,—worked upon by intrigues she could not comprehend, who refused her ministrations absolutely. They were not ill, they said, and the touch of the white woman meant pollution. Others there were who thrust their children before her and bade her bring color and strength back to these pale buds born in the darkness; and terrible, fierce-eyed girls who leaped upon her out of the dark, overwhelming her with passionate complaints that she did not and dared not understand. Monstrous and obscene pictures glared at her from the walls of the little rooms, and the images of shameless gods mocked her from their greasy niches above the doorways. The heat and the smell of cooking, faint fumes of incense, and the indescribable taint of overcrowded humanity,

caught her by the throat. But what she heard and what she guessed sickened her more than any visible horror. Plainly it was one thing to be stirred to generous action by a vivid recital of the state of the women of India, another to face the unutterable fact in the isolation of the women's apartments of the palace of Rhatore.

Tarvin meanwhile was going about spying out the land on a system which he had contrived for himself. It was conducted on the principle of exhaustion of the possibilities in the order of their importance—every movement which he made having the directest, though not always the most obvious, relation to the Naulahka.

He was free to come and go through the royal gardens, where innumerable and very seldom paid gardeners fought with water-skin and well-wheel against the destroying heat of the desert. He was welcomed in the Maharajah's stables, where eight hundred horses were littered down nightly, and was allowed to watch them go out for their morning exercise, four hundred at a time, in a whirlwind of dust. In the outer courts of the palace it was open to him to come and go as he chose—to watch the toilets of the elephants when the Maharajah went out in state, to laugh with the quarter-guard, and to unearth dragon-headed, snake-throated pieces of artillery, invented by native artificers, who, here in the East, had dreamed of the *mitrailleuse*. But Kate could go where he was forbidden to venture. He knew the life of a white woman to be as safe in Rhatore as in Topaz; but on the first day she disappeared, untroubled and unquestioning, behind the darkness of the veiled door leading to the apartments of the women of the palace, he found his hand going instinctively to the butt of his revolver.

The Maharajah was an excellent friend, and no bad hand at pachisi; but as Tarvin sat opposite him, half an hour later, he reflected that he should not recommend the Maharajah's life for insurance if anything happened to his love while she remained in those mysterious chambers from which the only sign that came to the outer world was a ceaseless whispering and rustling. When Kate came out, the little Maharaj Kunwar clinging to her hand, her face was

white and drawn, and her eyes full of indignant tears. She had seen.

Tarvin hastened to her side, but she put him from her with the imperious gesture that women know in deep moments, and fled to Mrs. Estes.

Tarvin felt himself for the moment rudely thrust out of her life. The Maharaj Kunwar found him that evening pacing up and down the veranda of the rest-house, almost sorry that he had not shot the Maharajah for bringing that look into Kate's eyes. With deep-drawn breath he thanked his God that he was there to watch and defend, and, if need were, to carry off, at the last, by force. With a shudder he fancied her here alone, save for the distant care of Mrs. Estes.

"I have brought this for Kate," said the child, descending from his carriage cautiously, with a parcel that filled both his arms. "Come with me there."

Nothing loath, Tarvin came, and they drove over to the house of the missionary.

"All the people in my palace," said the child as they went, "say that she's your Kate."

"I'm glad they know that much," muttered Tarvin to himself, savagely. "What's this you have got for her?" he asked the Maharaj aloud, laying his hand on the parcel.

"It is from my mother, the Queen—the real Queen, you know, because I am the Prince. There is a message, too, that I must not tell." He began to whisper, childlike, to himself, to keep the message in mind.

Kate was in the veranda when they arrived, and her face brightened a little at sight of the child.

"Tell my guard to stand back out of the garden. Go, and wait in the road."

The carriage and troopers withdrew. The child, still holding Tarvin's hand, held out the parcel to Kate.

"It is from my mother," he said. "You have seen her. This man need not go. He is"—he hesitated a little—"of your heart, is he not? Your speech is his speech."

Kate flushed, but did not attempt to set the child right. What could she say?

"And I am to tell this," he continued, "first before everything, till you quite understand." He spoke hesitatingly, translating out of his own vernacular as he went on, and drawing himself to his full height, as he cleared the cluster of emeralds from his brow. "My mother, the Queen,—the real Queen,—says, 'I was three months at this work. It is for you, because I have seen your face. That which has been made may be unraveled against our will, and a gipsy's hands are always picking. For the love of the gods look to it that a gipsy unravels nothing that I have made, for it is my life and soul to me. Protect this

work of mine that comes from me—a cloth nine years upon the loom.' I know more English than my mother," said the child, dropping into his ordinary speech.

Kate opened the parcel, and unrolled a crude yellow and black comforter, with a violent crimson fringe, clumsily knitted. With such labors the queens of Gokral Seetarun were wont to beguile their leisure.

"That is all," said the child. But he seemed unwilling to go. There was a lump in Kate's throat, as she handled the pitiful gift. Without warning the child, never loosening for a moment his grip on Tarvin's hand, began to repeat the message word by word, his little fingers tightening on Tarvin's fist as he went on.

"Say I am very grateful indeed," said Kate, a little puzzled, and not too sure of her voice.

"That was not the answer," said the child; and he looked appealingly at his tall friend, the new Englishman.

The idle talk of the commercial travelers in the veranda of the rest-house flashed through Tarvin's mind. He took a quick pace forward, and laid his hand on Kate's shoulder, whispering huskily:

"Can't you see what it means? It's the boy—the cloth nine years on the loom."

"But what can I do?" cried Kate, bewildered.

"Look after him. Keep on looking after him. You are quick enough in most things. Sitabhai wants his life. See that she does n't get it."

Kate began to understand a little. Everything was possible in that awful palace, even child-murder. She had already guessed the hate that lives between childless and mother queens. The Maharaj Kunwar stood motionless in the twilight, twinkling in his jeweled robes.

"Shall I say it again?" he asked.

"No, no, no, child! No!" she cried, flinging herself on her knees before him, and snatching his little figure to her breast, with a sudden access of tenderness and pity. "O Nick! what shall we do in this horrible country?" She began to cry.

"Ah!" said the Maharaj, utterly unmoved, "I was to go when I saw that you cried." He lifted up his voice for the carriage and troopers, and departed, leaving the shabby comforter on the floor.

Kate was sobbing in the half darkness. Neither Mrs. Estes nor her husband was within just then. That little "we" of hers went through Tarvin with a sweet and tingling ecstasy. He stooped and took her in his arms, and for that which followed Kate did not rebuke him.

"We'll pull through together, little girl," he whispered to the shaken head on his shoulder.

X.

DEAR FRIEND: That was very unkind of you, and you have made my life harder. I know I was weak. The child upset me. But I must do what I came for, and I want you to strengthen me, Nick, not hinder me. Don't come for a few days, please. I need all I am or hope to be for the work I see opening here. I think I can really do some good. Let me, please.—KATE.

Tarvin read fifty different meanings into this letter, received the following morning, and read them out again. At the end of his conjectures he could be sure only of one thing—that in spite of that moment's weakness, Kate was fixed upon her path. He could not yet prevail against her steadfast gentleness, and perhaps it would be better not to try. Talks in the veranda, and sentinel-like prowlings about her path when she went to the palace, were pleasant enough, but he had not come to Rhatore to tell her that he loved her. Topaz, in whose future the other half of his heart was bound up, knew that secret long ago, and—Topaz was waiting for the coming of the Three C.'s, even as Nick was waiting on Kate's comings and goings. The girl was unhappy, overstrained, and despairing, but since—he thanked God always—he was at hand to guard her from the absolute shock of evil fate, she might well be left for the moment to Mrs. Estes's comfort and sympathy.

She had already accomplished something in the guarded courts of the women's quarters, for the Maharaj Kunwar's mother had intrusted her only son's life to her care (who could help loving and trusting Kate?); but for his own part, what had he done for Topaz beyond—he looked toward the city—playing pachisi with the Maharajah? The low morning sun flung the shadow of the rest-house before him. The commercial travelers came out one by one, gazed at the walled bulk of Rhatore, and cursed it. Tarvin mounted his horse, of which much more hereafter, and ambled toward the city to pay his respects to the Maharajah. It was through him, if through any one, that he must possess himself of the Naulahka; he had been anxiously studying him, and shrewdly measuring the situation, and he now believed that he had formed a plan through which he might hope to make himself solid with the Maharajah—a plan which, whether it brought him the Naulahka or not, would at least allow him the privilege of staying at Rhatore. This privilege certain broad hints of Colonel Nolan's had seemed to Tarvin of late plainly to threaten, and it had become clear to him that he must at once acquire a practical and publishable object for his visit, if he had to rip up the entire state to find it. To

stay, he must do something in particular. What he had found to do was particular enough; it should be done forthwith, and it should bring him first the Naulahka, and then—if he was at all the man he took himself for—Kate!

As he approached the gates he saw Kate, in a brown habit, riding with Mrs. Estes out of the missionary's garden.

"You need n't be afraid, dear. I sha'n't bother you," he said to himself, smiling at the dust-cloud rising behind her, as he slackened his pace. "But I wonder what's taking you out so early."

The misery within the palace walls which had sent her half weeping to Mrs. Estes represented only a phase of the work for which Kate had come. If the wretchedness was so great under the shadow of the throne, what must the common folk endure? Kate was on her way to the hospital.

"There is only one native doctor at the hospital," Mrs. Estes was saying, as they went along, "and of course he's only a native; that is to say, he is idle."

"How can any one be idle here?" her companion cried, as the stored heat from under the city gates beat across their temples.

"Every one grows idle so soon in Rhatore," returned Mrs. Estes, with a little sigh, thinking of Lucien's high hopes and strenuous endeavors, long since subdued to a mild apathy.

Kate sat her horse with the assured seat of a Western girl who has learned to ride and to walk at the same time. Her well-borne little figure had advantages on horseback. The glow of resolve lighting her simply framed face at the moment lent it a spiritual beauty; and she was warmed by the consciousness that she drew near her purpose and the goal of two years' working and dreaming. As they rounded a curve in the main street of the city, a crowd was seen waiting at the foot of a flight of red sandstone steps rising to the platform of a whitewashed house three stories in height, on which appeared the sign, "State Dispensary." The letters leaned against one another, and drooped down over each side of the door.

A sense of the unreality of it all came over Kate as she surveyed the crowd of women, clad in vermilion, dull-red, indigo, saffron, blue, pink, and turquoise garments of raw silk. Almost every woman held a child on her hip, and a low wailing cry rose up as Kate drew rein. The women clustered about her stirrup, caught at her foot, and thrust their babies into her arms. She took one little one to her breast, and hushed it tenderly; it was burnt and dry with fever.

"Be careful," said Mrs. Estes; "there is

smallpox in the hills behind us, and these people have no notion of precautions."

Kate, listening to the cry of the women, did not answer. A portly, white-bearded native, in a brown camel's hair dressing-gown and patent-leather boots, came out of the dispensary, thrusting the women right and left, and bowing profoundly.

"You are new lady doctor?" he said. "Hospital is quite ready for inspection. Stand back from the miss sahib!" he shouted in the vernacular, as Kate slipped to the ground, and the crowd closed about her. Mrs. Estes remained in the saddle, watching the scene.

A woman of the desert, very tall, gold-colored, and scarlet-lipped, threw back her facecloth, caught Kate by the wrist, and made as if she would drag her away, crying aloud fiercely in the vernacular. The trouble in her eyes was not to be denied. Kate followed unresisting, and, as the crowd parted, saw a camel kneeling in the roadway. On its back a gaunt skeleton of a man was muttering, and picking aimlessly at the nail-studded saddle. The woman drew herself up to full height, and, without a word, flung herself down upon the ground, clasping Kate's feet. Kate stooped to raise her, her under lip quivering, and the doctor from the steps shouted cheerfully:

"Oh, that is all right. He is confirmed lunatic, her husband. She is always bringing him here."

"Have you done nothing, then?" cried Kate, turning on him angrily.

"What *can* do? She will not leave him here for treatment so I may blister him."

"Blister him!" murmured Kate to herself, appalled, as she caught the woman's hands and held them firmly. "Tell her that I say he must be left here," she said aloud. The doctor conveyed the command. The woman took a deep breath, and stared at Kate under level brows for a full half-minute. Then she carried Kate's hand to the man's forehead, and sat down in the dust, veiling her head.

Kate, dumb under these strange expressions of the workings of the Eastern mind, stared at her for a moment, with an impulse of the compassion which knows no race, before she bent and kissed her quietly on the forehead.

"Carry this man up," she said, pointing; and he was carried up the steps and into the hospital, his wife following like a dog. Once she turned and spoke to her sisters below, and there went up a little chorus of weeping and laughter.

"She says," said the doctor, beaming, "that she will kill any one who is impolite to you. Also, she will be the nurse of your son."

Kate paused to say a word to Mrs. Estes, who was bound on an errand further into the city; then she mounted the steps with the doctor.

"Now, will you see the hospital?" he asked. "But first let me introduce. I am Lalla Dhunpat Rai, Licentiate Medicine, from the Duff College. I was first native my province that took that degree. That was twenty years ago."

Kate looked at him wonderingly. "Where have you been since?" she asked.

"Some time I stayed in my father's house. Then I was clerk in medical stores in British India. But his Highness have graciously given me this appointment, which I hold now."

Kate lifted her eyebrows. This, then, was to be her colleague. They passed into the hospital together in silence, Kate holding the skirt of her riding-habit clear of the accumulated grime of the floor.

Six roughly made pallets, laced with hide and string, stood in the filthy central courtyard of the house, and on each cot a man, swathed in a white sheet, tossed and moaned and jabbered. A woman entered with a pot full of rancid native sweetmeats, and tried vainly to make one of the men eat of her delicacies. In the full glare of the sunlight stood a young man almost absolutely unclothed, his hands clasped behind his head, trying to outstare the sun. He began a chant, broke off, and hurried from bed to bed, shouting to each words that Kate could not understand. Then he returned to his place in the center, and took up his interrupted song.

"He is confirmed lunatic, also," said the doctor. "I have blistered and cupped him very severely, but he will not go away. He is quite harmless, except when he does not get his opium."

"Surely you don't allow the patients opium!" exclaimed Kate.

"Of course I allow opium. Otherwise they would die. All Rajputs eat opium."

"And you?" asked Kate, with horror.

"Once I did not — when I first came. But now —" He drew a smooth-worn tin tobacco-box from his waist, and took from it what appeared to Kate a handful of opium-pills.

Despair was going over her in successive waves. "Show me the women's ward," she said wearily.

"Oh, they are all up-stairs and down-stairs and round about," returned the doctor, casually.

"And the maternity cases?" she asked.

"They are in casual ward."

"Who attends to them?"

"They do not like me; but there is very clever woman from the outside — she comes in."

"Has she any training — any education?"

"She is much esteemed in her own village," said the doctor. "She is here now, if you wish to see."

"Where?" demanded Kate.

Dhunpat Rai, somewhat uneasy in his mind,

made haste to lead the way up a narrow staircase to a closed door, from behind which came the wail of a new life.

Kate flung the door open wrathfully. In that particular ward of the State Hospital were the clay and cow-dung images of two gods, which the woman in charge was besprinkling with marigold buds. Every window, every orifice that might admit a breath of air, was closed, and the birth-fire blazed fiercely in one corner, its fumes nearly asphyxiating Kate as she entered.

What happened between Kate and the much-esteemed woman will never be known. The girl did not emerge for half an hour. But the woman came out much sooner, disheveled, and cackling feebly.

After this Kate was prepared for anything, even for the neglected condition of the drugs in the dispensary,—the mortar was never cleaned, and every prescription carried to the patient many more drugs than were written for him,—and for the foul, undrained, uncleaned, unlighted, and unventilated rooms which she entered one after another hopelessly. The patients were allowed to receive their friends as they would, and to take from their hands whatever misguided kindness offered. When death came, the mourners howled in chorus about the cot, and bore the naked body through the courtyard, amid the jeers of the lunatic, to carry to the city what infection Heaven willed.

There was no isolation of infectious cases during the progress of the disease, and children scourged with ophthalmia played light-heartedly with the children of the visitors or among diphtheria-beds. At one point, and one point only, the doctor was strong; he was highly successful in dealing with the very common trouble entered on the day-book as "loin-bite." The wood-cutters and small traders who had occasion to travel through the lonely roads of the state were not infrequently struck down by tigers, and in these cases the doctor, discarding the entire English pharmacopœia, fell back on simples of proved repute in the neighboring villages, and wrought wonders. None the less, it was necessary to convey to him that in future there would be only one head of the State Hospital, that her orders must be obeyed without question, and that her name was Miss Kate Sheriff.

The doctor, reflecting that she attended on the women of the court, offered no protest. He had been through many such periods of reform and reorganization, and knew that his own inertia and a smooth tongue would carry him through many more. He bowed and assented, allowing Kate's reproaches to pass over his head, and parrying all questions with the statement:

"This hospital only allowed one hundred and fifty rupees per mensem from state revenues. How can get drugs all the way from Calcutta for that?"

"I am paying for this order," said Kate, writing out a list of needed drugs and appliances on the desk in the bath-room, which was supposed to serve as an office; "and I shall pay for whatever else I think necessary."

"Order going through me officially?" suggested Dhunpat Rai, with his head on one side.

Unwilling to raise unnecessary obstacles, Kate assented. With those poor creatures lying in the rooms about her unwatched, untended, at the mercy of this creature, it was not a time to argue about commissions.

"Yes," she said decidedly; "of course." And the doctor, when he saw the size and scope of the order, felt that he could endure much at her hands.

At the end of the three hours Kate came away, fainting with weariness, want of food, and bitter heartache.

XI.

TARVIN found the Maharajah, who had not yet taken his morning allowance of opium, sunk in the deepest depression. The man from Topaz gazed at him shrewdly, filled with his purpose.

The Maharajah's first words helped him to declare it. "What have you come here for?" he asked.

"To Rhatore?" inquired Tarvin, with a smile that embraced the whole horizon.

"Yes; to Rhatore," grunted the Maharajah. "The agent sahib says you do not belong to any government, and that you have come here only to see things and write lies about them. Why have you come?"

"I have come to turn your river. There is gold in it," he said steadily.

The Rajah answered him with brevity. "Go and speak to the Government," he said sulkily.

"It's your river, I guess," returned Tarvin, cheerfully.

"Mine! Nothing in the state is mine. The shopkeeper people are at my gates day and night. The agent sahib won't let me collect taxes as my fathers used to do. I have no army."

"That's perfectly true," assented Tarvin, under his breath. "I'll run off with it some morning."

"And if I had," continued the Maharajah, "I have no one to fight against. I am only an old wolf, with all my teeth drawn. Go away!"

They were talking in the flagged courtyard immediately outside that wing of the palace occupied by Sitabhai. The Maharajah was sitting in a broken Windsor chair, while his grooms brought up successive files of horses, saddled

and bridled, in the hope that one of the animals might be chosen for his Majesty's ride. The stale, sick air of the palace drifted across the marble flags before the morning wind, and it was not a wholesome smell.

Tarvin, who had drawn rein in the courtyard without dismounting, flung his right leg over the pony's withers, and held his peace. He had seen something of the effect of opium upon the Maharajah. A servant was approaching with a small brass bowl full of opium and water. The Maharajah swallowed the draught with many wry faces, dashed the last brown drops from his mustache and beard, and dropped back into the chair, staring with vacant eyes. In a few minutes he sprang to his feet, erect and smiling.

"Are you here, Sahib?" said he. "You are here, or I should not feel ready to laugh. Do you go riding this morning?"

"I'm your man."

"Then we will bring out the Foxhall colt. He will throw you."

"Very good," said Tarvin, leisurely.

"And I will ride my own Cutch mare. Let us get away before the agent sahib comes," said the Maharajah.

The blast of a bugle was heard without the courtyard, and a clatter of wheels, as the grooms departed to saddle the horses.

The Maharaj Kunwar ran up the steps and pattered toward the Maharajah, his father, who picked him up in his lap, and fondled him.

"What brings thee here, Lalji?" asked the Maharajah. Lalji, the Beloved, was the familiar name by which the Prince was known within the palace.

"I came to exercise my guard. Father, they are giving me bad saddlery for my troopers from the state arsenal. Jeysingh's saddle-peak is mended with string, and Jeysingh is the best of my soldiers. Moreover, he tells me nice tales," said the Maharaj Kunwar, speaking in the vernacular, with a friendly little nod toward Tarvin.

"Hai! Hai! Thou art like all the rest," said the King. "Always some fresh demand upon the state. And what is it now?"

The child joined his little hands together, and caught his father fearlessly by his monstrous beard, which, in the manner of a Rajput, was brushed up over his ears. "Only ten little new saddles," said the child. "They are in the big saddle-rooms. I have seen them. But the keeper of the horses said that I was first to ask the King."

The Maharajah's face darkened, and he swore a great oath by his gods.

"The King is a slave and a servant," he growled—"the servant of the agent sahib and

this woman-talking English Raj; but, by Indur! the King's son is at least a King's son. What right had Saroop Singh to stay thee from anything that thou desiredst, Prince?"

"I told him," said the Maharaj Kunwar, "that my father would not be pleased. But I said no more, because I was not very well, and thou knowest"—the boy's head drooped under the turban—"I am only a little child. I may have the saddles?"

Tarvin, to whom no word of this conversation was intelligible, sat at ease on his pony, smiling at his friend the Maharaj. The interview had begun in the dead dawn-silence of the courtyard—a silence so intense that he could hear the doves cooing on a tower a hundred and fifty feet above his head. But now all four sides of the green-shuttered courtyard were alive, awake, and intent about him. He could hear muffled breathings, the rustle of draperies, and the faintest possible jarring of shutters, cautiously opened from within. A heavy smell of musk and jasmine came to his nostrils and filled him with uneasiness, for he knew, without turning his head or his eyes, that Sitabhai and her women were watching all that went on. But neither the King nor the Prince heeded. The Maharaj Kunwar was very full of his English lessons, learned at Mrs. Estes's knee, and the King was as interested as he. Lest Tarvin should fail to understand, the Prince began to speak in English again, but very slowly and distinctly, that his father also might comprehend.

"And this is a new verse," he said, "which I learned only yesterday."

"Is there any talk of their gods in it?" asked the Maharajah, suspiciously. "Remember thou art a Rajput."

"No; oh, no!" said the Prince. "It is only English, and I learned it very quickly."

"Let me hear, little Pundit. Some day thou wilt become a scribe, and go to the English colleges, and wear a long black gown."

The child slipped quickly back into the vernacular. "The flag of our state has five colors," he said. "When I have fought for that, perhaps I will become an Englishman."

"There is no leading of armies afield any more, little one; but say thy verses."

The subdued rustle of unseen hundreds grew more intense. Tarvin leaned forward with his chin in his hand, as the Prince slid down from his father's lap, put his hands behind him, and began, without pauses or expression:

"Tiger, tiger, burning bright
In the forests of the night,
What immortal hand or eye
Framed thy fearful symmetry?
When thy heart began to beat,
What dread hand made thy dread feet?"

"There is more that I have forgotten," he went on, "but the last line is:

"Did he who made the lamb make thee?"

I learned it all very quickly." And he began to applaud himself with both hands, while Tarvin followed suit.

"I do not understand; but it is good to know English. Thy friend here speaks such English as I never knew," said the Maharajah in the vernacular.

"Aye," rejoined the Prince; "but he speaks with his face and his hands alive—so; and I laugh before I know why. Now Colonel Nolan Sahib speaks like a buffalo, with his mouth shut. I cannot tell whether he is angry or pleased. But, father, what does Tarvin Sahib do here?"

"We go for a ride together," returned the King. "When we return, perhaps I will tell thee. What do the men about thee say of him?"

"They say he is a man of clean heart; and he is always kind to me."

"Has he said aught to thee of me?"

"Never in language that I could understand. But I do not doubt that he is a good man. See, he is laughing now."

Tarvin, who had pricked up his ears at hearing his own name, now resettled himself in the saddle, and gathered up his reins, as a hint to the King that it was time to be moving.

The grooms brought up a long, switch-tailed English thoroughbred and a lean, mouse-colored mare. The Maharajah rose to his feet.

"Go back to Saroop Singh and get the saddles, Prince," said he.

"What are you going to do to-day, little man?" asked Tarvin.

"I shall go and get new equipment," answered the child, "and then I shall come to play with the prime minister's son here."

Again, like the hiss of a hidden snake, the rustle behind the shutters increased. Evidently some one there understood the child's words.

"Shall you see Miss Kate to-day?"

"Not to-day. 'Tis holiday for me. I do not go to Miss Estes to-day."

The King turned on Tarvin swiftly, and spoke under his breath.

"Must he see that doctor lady every day? All my people lie to me, in the hope of winning my favor; even Colonel Nolan says that the child is very strong. Speak the truth. He is my first son."

"He is not strong," answered Tarvin, calmly. "Perhaps it would be better to let him see Miss Sheriff this morning. You don't lose anything by keeping your weather eye open, you know."

"I do not understand," said the King; "but go to the missionary's house to-day, my son."

"I am to come here and play," answered the Prince, petulantly.

"You don't know what Miss Sheriff's got for you to play with," said Tarvin.

"What is it?" asked the Maharaj, sharply.

"You've got a carriage and ten troopers," replied Tarvin. "You've only got to go there and find out."

He drew a letter from his breast-pocket, glancing with liking at the two-cent American stamp, and scribbled a note to Kate on the envelop, which ran thus:

Keep the little fellow with you to-day. There's a wicked look about things this morning. Find something for him to do; get up games for him; do anything, but keep him away from the palace. I got your note. All right. I understand.

He called the Maharaj to him, and handed him the note. "Take this to Miss Kate, like a little man, and say I sent you," he said.

"My son is not an orderly," said the King, surlily.

"Your son is not very well, and I'm the first to speak the truth to you about him, it seems to me," said Tarvin. "Gently on that colt's mouth—you." The Foxhall colt was dancing between his grooms.

"You'll be thrown," said the Maharaj Kunwar, in an ecstasy of delight. "He throws all his grooms."

At that moment a shutter in the courtyard clicked distinctly three times in the silence.

One of the grooms passed to the off side of the plunging colt deftly. Tarvin put his foot into the stirrup to spring up, when the saddle turned completely round. Some one let go of the horse's head, and Tarvin had just time to kick his foot free as the animal sprang forward.

"I've seen slicker ways of killing a man than that," he said quietly. "Bring my friend back," he added to one of the grooms; and when the Foxhall colt was under his hands again he cinched him up as the beast had not been girt since he had first felt the bit. "Now," he said, and leaped into the saddle, as the King clattered out of the courtyard.

The colt reared on end, landed stiffly on his fore feet, and lashed out. Tarvin, sitting him with the cowboy seat, said quietly to the child, who was still watching his movements, "Run along, Maharaj. Don't hang around here. Let me see you started for Miss Kate."

The boy obeyed, with a regretful glance at the prancing horse. Then the Foxhall colt devoted himself to unseating his rider. He refused to quit the courtyard, though Tarvin

argued with him, first behind the saddle, and then between the indignant ears. Accustomed to grooms who slipped off at the first sign of rebellion, the Foxhall colt was wrathful. Without warning, he dashed through the archway, wheeled on his haunches, and bolted in pursuit of the Maharajah's mare. Once in the open, sandy country, he felt that he had a field worthy of his powers. Tarvin also saw his opportunity. The Maharajah, known in his youth as a hard rider among a nation of perhaps the hardest riders on earth, turned in his saddle and watched the battle with interest.

"You ride like a Rajput," he shouted, as Tarvin flew past him. "Breathe him on a straight course in the open."

"Not till he's learned who's boss," replied Tarvin, and he wrenched the colt around.

"*Shabash! Shabash!* Oh, well done! Well done!" cried the Maharajah, as the colt answered the bit. "Tarvin Sahib, I'll make you colonel of my regular cavalry."

"Ten million irregular devils!" said Tarvin, impolitely. "Come back, you brute! Back!"

The horse's head was bowed on his lathered chest under the pressure of the curb; but before obeying he planted his fore feet, and bucked as viciously as one of Tarvin's own broncos. "Both feet down and chest extended," he murmured gaily to himself, as the creature see-sawed up and down. He was in his element, and dreamed himself back in Topaz.

"*Maro! Maro!*" exclaimed the king. "Hit him hard! Hit him well!"

"Oh, let him have his little picnic," said Tarvin, easily. "I like it."

When the colt was tired he was forced to back for ten yards. "Now we'll go on," said Tarvin, and fell into a trot by the side of the Maharajah. "That river of yours is full of gold," he said, after a moment's silence, as if continuing an uninterrupted conversation.

"When I was a young man," said the King, "I rode pig here. We chased them with the sword in the springtime. That was before the English came. Over there, by that pile of rock, I broke my collar-bone."

"Full of gold, Maharajah Sahib. How do you propose to get it out?"

Tarvin knew something already of the King's discursiveness; he did not mean to give way to it.

"What do I know?" answered the King, solemnly. "Ask the agent sahib."

"But, look here, who *does* run this state, you or Colonel Nolan?"

"You know," returned the Maharajah. "You have seen." He pointed north and south. "There," he said, "is one railway line;

yonder is another. I am a goat between two wolves."

"Well, anyway, the country between is your own. Surely you can do what you like with that."

They had ridden some two or three miles beyond the city, parallel with the course of the Amet River, their horses sinking fetlock-deep in the soft sand. The King looked along the chain of shining pools, the white, rush-tipped hillocks of the desert, and the far-distant line of low granite-topped hills, whence the Amet sprang. It was not a prospect to delight the heart of a king.

"Yes; I am lord of all this country," he said. "But, look you, one fourth of my revenue is swallowed up by those who collect it; one fourth those black-faced camel-breeders in the sand there will not pay, and I must not march troops against them; one fourth I myself, perhaps, receive; but the people who should pay the other fourth do not know to whom it should be sent. Yes; I am a very rich king."

"Well, any way you look at it, the river ought to treble your income."

The Maharajah looked at Tarvin intently.

"What would the Government say?" he asked.

"I don't quite see where the Government comes in. You can lay out orange-gardens and take canals around them." (There was a deep-set twinkle of comprehension in his Majesty's eye.) "Working the river would be much easier. You've tried placer-mining here, have n't you?"

"There was some washing in the bed of the river one summer. My jails were too full of convicts, and I feared rebellion. But there was nothing to see, except those black dogs digging in the sand. That year I won the Poonah cup with a bay pony."

Tarvin brought his hand down on his thigh with an unguarded smack. What was the use of talking business to this wearied man, who would pawn what the opium had left to him of soul for something to see? He shifted his ground instantly.

"Yes; that sort of mining is nothing to look at. What you want is a little dam up Gungraway."

"Near the hills?"

"Yes."

"No man has ever dammed the Amet," said the King. "It comes out of the ground, and sinks back into the ground, and when the rain falls it is as big as the Indus."

"We'll have the whole bed of it laid bare before the rains begin—bare for twelve miles," said Tarvin, watching the effect on his companion.

"No man has dammed the Amet," was the stony reply.

"No *man* has ever tried. Give me all the labor I want, and *I* will dam the Amet."

"Where will the water go?" inquired the King.

"I'll take it around another way, as you took the canal around the orange-garden, of course."

"Ah! *Then* Colonel Nolan talked to me as if I were a child."

"You know why, Maharajah Sahib," said Tarvin, placidly.

The King was frozen for a moment by this audacity. He knew that all the secrets of his domestic life were common talk in the mouths of the city, for no man can bridle three hundred women; but he was not prepared to find them so frankly hinted at by this irreverent stranger, who was and was not an Englishman.

"Colonel Nolan will say nothing this time," continued Tarvin. "Besides, it will help your people."

"Who are also his," said the King.

The opium was dying out of his brain, and his head fell forward upon his chest.

"Then I shall begin to-morrow," said Tarvin. "It will be something to see. I must find the best place to dam the river, and I dare say you can lend me a few hundred convicts."

"But why have you come here at all," asked the King, "to dam my rivers, and turn my state upside down?"

"Because it's good for you to laugh, Maharajah Sahib. You know that as well as I do. I will play pachisi with you every night until you are tired, and I can speak the truth—a rare commodity in these parts."

"Did you speak truth about the Maharaj Kunwar? Is he indeed not well?"

"I have told you he is n't quite strong. But there's nothing the matter with him that Miss Sheriff can't put right."

"Is that the truth?" demanded the King. "Remember, he has my throne after me."

"If I know Miss Sheriff, he'll have that throne. Don't you fret, Maharajah Sahib."

"You are great friend of hers?" pursued his companion. "You both come from one country?"

"Yes," assented Tarvin; "and one town."

"Tell me about that town," said the King, curiously.

Tarvin, nothing loath, told him—told him at length, in detail, and with his own touches of verisimilitude, forgetting in the heat of admiration and affection that the King could understand, at best, not more than one word in ten of his vigorous Western colloquialisms.

Half-way through his rhapsody the King interrupted.

"If it was so good, why did you not stay there?"

"I came to see you," said Tarvin, quickly. "I heard about you there."

"Then it is true, what my poets sing to me, that my fame is known in the four corners of the earth? I will fill Bussant Rao's mouth with gold if it is so."

"You can bet your life. Would you like me to go away, though? Say the word!" Tarvin made as if to check his horse.

The Maharajah remained sunk in deep thought, and when he spoke it was slowly and distinctly, that Tarvin might catch every word. "I hate all the English," he said. "Their ways are not my ways, and they make such trouble over the killing of a man here and there. *Your* ways are not my ways; but you do not give so much trouble, and you are a friend of the doctor lady."

"Well, I hope I'm a friend of the Maharaj Kunwar's too," said Tarvin.

"Are you a true friend to him?" asked the King, eyeing him closely.

"That's all right. I'd like to see the man who tried to lay a hand on the little one. He'd vanish, King; he'd disappear; he would n't be. I'd mop up Gokral Seetarun with him."

"I have seen you hit that rupee. Do it again."

Without thinking for a moment of the Fox-hall colt, Tarvin drew his revolver, tossed a coin into the air, and fired. The coin fell beside them,—a fresh one this time,—marked squarely in the center. The colt plunged furiously, and the Cutch mare curveted. There was a thunder of hoofs behind them. The escort, which, till now, had waited respectfully a quarter of a mile behind, were racing up at full speed, with leveled lances. The King laughed a little contemptuously.

"They are thinking you have shot me," he said. "So they will kill you, unless I stop them. Shall I stop them?"

Tarvin thrust out his under jaw with a motion peculiar to himself, wheeled the colt, and waited without answering, his empty hands folded on the pommel of his saddle. The troop swept down in an irregular mob, each man crouching, lance in rest, over his saddle-bow, and the captain of the troop flourishing a long, straight Rajput sword. Tarvin felt rather than saw the lean, venomous lance-heads converging on the breast of the colt. The King drew off a few yards, and watched him where he stood alone in the center of the plain, waiting. For that single moment, in which he faced death, Tarvin thought to

himself that he preferred any customer to a maharajah.

Suddenly his Highness shouted once, the lance-butts fell as though they had been smitten down, and the troop, opening out, whirled by on each side of Tarvin, each man striving as nearly as might be to brush the white man's boot.

The white man stared in front of him without turning his head, and the King gave a little grunt of approval.

"Would you have done that for the Maharaj Kunwar?" he asked, wheeling his mare in again beside him, after a pause.

"No," said Tarvin, placidly. "I should have begun shooting long before."

"What! Fifty men?"

"No; the captain."

The King shook in his saddle with laughter, and held up his hand. The commandant of the troop trotted up.

"Ohe, Pertab Singh-Ji, he says he would have shot thee." Then, turning to Tarvin, smiling, "That is my cousin."

The burly Rajput captain grinned from ear to ear, and, to Tarvin's surprise, answered in perfect English: "That would do for irregular cavalry,—to kill the subalterns, you understand,—but we are drilled exclusively on English model, and I have my commission from the Queen. Now, in the German army —"

Tarvin looked at him in blank amazement.

"But you are not connected with the military," said Pertab Singh-Ji, politely. "I have heard how you shot, and I saw what you were doing. But you must please excuse. When a shot is fired near his Highness it is our order always to come up."

He saluted, and withdrew to his troop.

The sun was growing unpleasantly hot, and the King and Tarvin trotted back toward the city.

"How many convicts can you lend me?" asked Tarvin, as they went.

"All my jails full, if you want them," was the enthusiastic answer. "By God, sahib, I never saw anything like that. I would give you anything."

Tarvin took off his hat, and mopped his forehead, laughing.

"Very good, then. I'll ask for something that will cost you nothing."

The Maharajah grunted doubtfully. People generally demanded of him things he was not willing to part with.

"That talk is new to me, Tarvin Sahib," said he.

"You'll see I'm in earnest when I say I only want to look at the Naulahka. I've seen all your state diamonds and gold carriages, but I have n't seen that."

The Maharajah trotted fifty yards without replying. Then:

"Do they speak of it where you come from?"

"Of course. All Americans know that it's the biggest thing in India. It's in all the guide-books," said Tarvin, brazenly.

"Do the books say where it is? The English people are so wise." The Maharajah stared straight in front of him, and almost smiled.

"No; but they say you know, and I'd like to see it."

"You must understand, Tarvin Sahib,"—the Maharajah spoke meditatively,—"that this is not *a* state jewel, but *the* state jewel—the jewel of the state. It is a holy thing. Even I do not keep it, and I cannot give you any order to see it."

Tarvin's heart sank.

"But," the Maharajah continued, "if I say where it is, you can go at your own risk, without Government interfering. I have seen you are not afraid of risk, and I am a very grateful man. Perhaps the priests will show you; perhaps they will not. Or perhaps you will not find the priests at all. Oh, I forgot; it is not in *that* temple that I was thinking of. No; it must be in the Gye-Mukh—the Cow's Mouth. But there are no priests there, and nobody goes. Of course it is in the Cow's Mouth. I thought it was in this city," resumed the Maharajah. He spoke as if he were talking of a dropped horseshoe or a mislaid turban.

"Oh, of course. The Cow's Mouth," repeated Tarvin, as if this also were in the guide-books.

Chuckling with renewed animation, the King went on: "By God, only a very brave man would go to the Gye-Mukh; such a brave man as yourself, Tarvin Sahib," he added, giving his companion a shrewd look. "Ho, ho! Pertab Singh-Ji would not go. No; not with all his troops that you conquered to-day."

"Keep your praise until I've earned it, Maharajah Sahib," said Tarvin. "Wait until I've dammed that river." He was silent for a while, as if digesting this newest piece of information.

"Now, you have a city like this city, I suppose?" said the Maharajah, interrogatively, pointing to Rhatore.

Tarvin had overcome in a measure his first feeling of contempt for the state of Gokral Seetarun and the city of Rhatore. He had begun to look upon them both, as was his nature in the case of people and things with which he dwelt, with a certain kindness.

"Topaz is going to be bigger," he explained.

"And when you are there what is your official position?" asked the Maharajah.

Tarvin, without answering, drew from his breast-pocket the cable from Mrs. Mutrie, and

handed it in silence to the King. Where an election was concerned even the sympathy of an opium-soaked Rajput was not indifferent to him.

"What does it mean?" asked the King, and Tarvin threw up his hands in despair.

He explained his connection with the government of his State, making the Colorado legislature appear as one of the parliaments of America. He owned up to being the Hon. Nicholas Tarvin, if the Maharajah really wanted to give him his full title.

"Such as the members of provincial councils that come here?" suggested the Maharajah, remembering the gray-headed men who

visited him from time to time, charged with authority only little less than that of a viceroy. "But still you will not write letters to that legislature about my government?" queried he suspiciously, recalling again over-curious emissaries from the British Parliament over seas, who sat their horses like sacks, and talked interminably of good government when he wished to go to bed. "And, above all," he added slowly, as they drew near to the palace, "you are most true friend of the Maharaj Kunwar? And your friend, the lady doctor, will make him well?"

"That," said Tarvin, with a sudden inspiration, "is what we are both here for!"

(To be continued.)

THE DEGRADATION OF A STATE;

OR, THE CHARITABLE CAREER OF THE LOUISIANA LOTTERY.

DOUBTLESS there are men among us who harbor scruples against a money-wager, just as there may be women too timid or too conscientious to smuggle; but that we as a people have a growing courage of our gambling propensities is a fact too obvious to be gainsaid. Now and then a hostile voice is heard, but it is not always irreconcilable. A recent public letter from a distinguished church authority contains an implied censure on the Louisiana Lottery, but at the same time makes the distinction that "a lottery, under certain conditions, is not opposed *per se* to the moral law." In justice to the Louisiana Lottery, I shall endeavor to show later that it is an institution which fosters with jealous care the *per se* of the business; so a person who is merely opposed to the manner in which the Louisiana Lottery is administered may yet learn to admire its benefactions in the past and its new and improved scheme of benevolence for the future.

It is a trait of the self-righteous to forget the past, when they were no better than the rest of us. Who says there shall be no more lotteries in Thomas Jefferson's land of "life, liberty, and the pursuit of happiness," when that great man was himself constrained to favor lotteries for public purposes? To be sure, in his old age he took philosophic ground against them, but if he could return to us to-day, he might well be interested to see how large a part the wheel of fortune plays in our present "pursuit of happiness." As a lover of democratic equality he would see tens of thousands min-

gling amicably in "exchanges" of different sorts where no particular gamble is raised above any other gamble; where the old and the young, the affluent man of success and the young clerk or messenger-boy just beginning his business life, make their bets on the results of horse-races or base-ball games, or pugilistic encounters, or even on the outcome of the American citizen's proud exercise of the right of manhood suffrage. As a maker of laws he would be amused to learn that the laws of the land are opposed to all these practices, which nevertheless are carried on openly because the hearts and souls of the people cry out for them. As the founder of a university he would speculate on the importance of athletic contests in our college life, and observe, if he had half an eye, that nine out of ten of the students also speculate on them. As a one-time advocate of a national lottery, he would be interested to know that the yearly proceeds of the Louisiana Lottery have grown to be twice as large as the revenues of the United States in 1800; and if he should feel any disappointment that out of the annual millions of profit to a handful of lottery-owners only a bagatelle of \$40,000 a year (in lieu of all taxes) is contributed to the charities of Louisiana, he would be asked to consider, first, that some philosophers look upon a large charitable fund with distrust; second, that the Lottery Company has promised to raise its benefactions to \$1,250,000 a year, as a bid for a new lease of life and a firm seat on the corner-stone of the State; and, last that the Louisiana Lottery is the most important training-school we possess for the higher gam-

bling institutions of our grand republic. It is the kindergarten, so to speak, in which the happy school-boy or the luckless orphan may bet the dimes he has hoarded, begged, or stolen; and it is the sequestered sanctuary where the frugal housewife or the lone widow may also drop her nickel in the slot and cause the wheel of fortune to revolve for her. It is after this manner that lotteries do good by stealth. And let no purse-proud statesman who will not be beggared if he lose his political wager, nor any well-to-do citizen who thinks the thrill of losing a thousand dollars on a horse-race is worth all it costs, nor the gentleman who enjoys the sedentary amusement of "bucking the tiger," presume to take from the poor their cherished game of chance! The profligate rich have ever been ready to resent the so-called pernicious amusements of the poor!

When the traveler turns his face toward New Orleans, a still small voice asks if Fortune has ever done anything for him. If not, why not? And may not Fortune have been waiting for this very visit to the capital of lottery gambling? Visiting actors forget their cues in devising lucky numbers; conventions of bankers compliment the local bankers, many of whom favor the Lottery, by making a losing investment; boards of serious business directors, when they meet, often contribute to a common fund for lottery tickets.

In the very heart of the city the large main office of the Lottery stands, with its opaque windows and general air of being something sinister; in the courtyard an alligator suns himself in the shallow fountain and gives color to the rumor that the poor of the city, in worshipping the goddess Fortune, cast their children to the monster; some say they only starve and poorly clothe their children to this end, the live alligator being merely an emblematic character.

Turn whichever way from his hotel the stranger will, his attention is arrested by neatly printed slips of paper hung on strings in the windows of shops. He learns that these are mostly fractional lottery tickets, worth a dollar apiece, and that twenty of them make a whole ticket. Since 100,000 whole tickets constitute the ordinary monthly drawing, their money value is \$2,000,000. What opulence! Out of that sum \$1,054,600 is alleged to be distributed in 3134 prizes, ranging from \$300,000 to \$100. What benevolence! The clever device of dividing each ticket into twenty parts was invented so that the Lottery Company, by keeping back parts of each ticket, when there is a likelihood that all the tickets will not be sold, may preserve the ratio of sales and liability for prizes, and thereby avoid all risk to

itself. The word "risk" is here used in a Pickwickian sense; it has no other meaning in the Lottery dictionary. The exact case is that *you and others* hand to the Lottery \$2,000,000, and it gives back to *some of you* \$1,054,600, or about \$52 out of every \$100. That this is a swindle on the face of it is the very thing which the Lottery as a profound student of human nature counts upon. If it says it receives \$100 for nothing, anybody will believe it can afford to surrender \$52.

And likewise when a so-called sailor comes into your office with gaudy goods which he says he has smuggled, the temptation is not to kick him out; the temptation is to buy the goods at "a great reduction," with the certainty, as you afterward discover, that they are worth nothing at all.

Twice a year the Lottery increases its capital prize to \$600,000, and the price of each ticket (of forty fractional parts) to \$40; so the ratio is the same as in the ordinary monthly drawing. This semiannual drawing is devised to attract money from foreign countries as well as from the American citizen. The aggregate of these monthly and semiannual schemes is \$28,000,000. Croesus outdone! And out of this great sum \$40,000 (in lieu of all taxes, which by law would be several times as much) is paid to the Charity Hospital of New Orleans. A new miracle of the loaves and fishes! Since the Lottery has a local daily drawing which pays all the expenses of the concern, there is the possibility that its net income is only \$13,440,000, if we admit that the drawings are honest; and this is a case in which honesty costs nothing except the tedium of waiting for the prize-money to come back as the price of more tickets. It is a case also in which a semblance of honesty may serve as a great advertising feature. Fractions of the November capital prize were drawn in six widely separated cities, by which it appears that only three tenths, or \$90,000, of the capital prize of \$300,000 may ever have left the coffers of the Lottery, in case only one fractional ticket was sold in each of those cities.

A drawing occurred the third day after my arrival. On that morning New Orleans was in a ferment over the local primary election for delegates to the State convention, in which election the Lottery candidate for governor got all the men chosen. But in the business section of the town the excitement over the drawing was paramount. Women vendors of tickets were making their last calls at offices, and street brokers were thronging hotel lobbies and bar-rooms. As eleven o'clock approached, dealers rushed with their unsold tickets to the main office, preferring their fifteen per cent. commission on the tickets they had sold to the

chance of winning a great sum by becoming responsible for the unsold tickets. Opposite, in a theater, the drawing promptly began. One of the boxes was occupied by ladies who took a homelike interest in the proceedings. The sparse company of men, in the body of the theater, were redolent of rum and tobacco and poor bathing facilities, and had no taste or money for clean raiment. In their character as investors they made one think of Cable's 'Sieur George, of the old French quarter near by, who was respected for a supposed trunk full of money, that proved to be a trunk full of unlucky lottery tickets.

Though the onlookers were a thin and a sad show, it was no ordinary spectacle to see General G. T. Beauregard and Lieutenant-General Jubal A. Early presiding over the wheels of fortune and producing by virtue of their ancient reputations a large part of the allurements of the Lottery. The former carried off the honors of the first pitched battle of the Confederacy, and to the last day of the struggle stood among its foremost soldiers. He had a genius for controversy, and was the object of much misrepresentation which credited him with the threat that he would "water his horse in the Tennessee River or in hell." Most Confederate soldiers think the Tennessee should have sufficed; but they say little about the matter for the sake of a cause which remains only in sentiment. His is a job requiring only a few hours' time each month,—I will not call it easy,—the pay of which is variously estimated at \$12,000 to \$30,000. No matter how large the sum, it is a good bargain for the Lottery. In marshaling the forces of the smaller wheel that contains the prize-slips in gutta-percha tubes, he did not wear full Confederate uniform, or medals of honor. He was simply a quiet, dignified gentleman in civilian's dress, who in any company would be singled out for a man of distinction. He sat in a chair, received the prize-tubes from a blindfolded boy, and every twentieth prize closed the wheel for the periodical stirring up. Occasionally he yielded his place to an assistant.

General Early, the other "commissioner" on a similar salary, seldom divides the honor of his office with anybody. His wheel, on the day mentioned, contained the hundred thousand numbers. It is six feet or more in diameter, and in contrast with the other wheel justifies the remark of a New Orleans accountant, who bought lottery tickets until he visited a drawing and saw "an omnibus full of numbers, and a silk hat full of prizes," which well represents the benevolent basis of the scheme. General Early is over six feet tall; he still affects gray cloth, and, with his patriarchal beard and stoop, certainly has a saintly look as he sits on the

platform and calls off "fortune's favorites." He makes no claim to saintliness, however, and it is well known that when he was the trusted lieutenant of Lee and was fighting up and down the Valley with limited resources, "Old Jube" could hold his own with any mule-driver in the Confederacy. Besides being a good soldier, General Early was a careful writer; his reports are among the best-written documents in the Official Records. It is said that a prominent "Daughter of the Confederacy" once took him feelingly to task for accepting a degrading position to which General Lee would not have assigned him, since Lee would have died before he would have taken it at any price.

The facts in regard to this Lottery and its personnel, no matter how indirectly put, will seem to be harshly said. To a stranger the "daily drawing" with the "policy" playing, in one hundred and eight special local offices, has a look compared with which the rest of the business is divine. It is hard to speak disrespectfully of any charity, but every local shop I entered breathed the atmospheric ooze of a pawnshop, and almost every customer I saw was a fit object of charity. Some showed a tremor of excitement in asking for their favorite number or combination. The best-dressed customer I saw was a widow in her weeds, her hat having the shape of a sun-bonnet. Children are sent for tickets, sometimes in the suburbs for a long distance.

In the daily drawing, held at 4 P. M., the chances are absurdly slight for the players, and all the delusions of ignorance and fatuity are at work. On the streets may be seen trained parrakeets that for five cents will pick out a winning number. A famous play is the "washerwoman's gig," 4-11-44. On the two days preceding the primary election, it so happened that approximations to that "gig," such as 3-11-44 and 4-11-54, were drawn, a coincidence which excited comment. Inveterate players stop children in the street and ask their age; they consult voodoo doctors; if they see a stray dog, they play 6; a drunken man counts 14, and a dead woman 59; an exposed leg plays the mystic number 11; and to dream of a fish is a reminder to play 13. Such nonsense as this takes the place of ideas of thrift and industry with a steadily growing part of the population, as the diminishing returns of the savings-banks sufficiently prove.

The promoters of the Louisiana Lottery should not be venerated as the inventors of this scheme of public beneficence; but they have had the ability to improve on previous models, which in one form or another date back to those dreamy days of Rome when even vice was esteemed a virtue, and all mankind was gay, if not happy. In the middle ages the lottery re-

appeared as one of the relics of civilization saved from the wreck of Italy. It was a chartered resource of nearly all the free cities. Those French kings whose deportment continues to be the theme of sad-eyed moralists all placed their trust in lotteries. Louis XIV. was as charitable in his intentions as the Louisiana Lottery, which must have borrowed its preamble from that pious king. Sometimes the proceeds were devoted to war and rapine, and sometimes to the endowment of public or religious institutions; the Church of St. Sulpice is said to have been built by lottery; and from that time to this the charitable lottery, the meek raffle, and the pious grab-bag have often demonstrated by their proceeds that they are "not opposed *per se* to the moral law." But there was an isolated bishop of Autun who rebelled against the receptivity of the church, and said the lottery was no better than any other form of gambling; the Archbishop of New Orleans has fallen into the same way of thinking, and has forbidden the blessing of lottery tickets. This is an interference with the spiritual freedom of the Louisiana Lottery and its home patrons which will lead, no doubt, if it has not already done so, to the placing by the Lottery of a part of its appropriation for church work outside the State or perhaps abroad. To form an adequate idea of the temerity of the Archbishop of New Orleans one must visit his fine old cathedral, listen to the tuneful Creole choir, and hear a nickel run riot in the contribution-basket as it is carried about by the grizzled verger with his staff, sword, red coat, and cocked hat. How can laying up treasures in heaven be anything but uncongenial business in a city where twenty-five cents will buy a chance in a "daily drawing," under the temporal protection of the great State of Louisiana and the guarantee of high spiritual authority that "under certain conditions it is not opposed *per se* to the moral law"?

In England lotteries once flourished, but since 1826, with that sublime inconsistency which enables the Englishman to make a fetish of race-betting and an aristocratic privilege of baccarat, the lottery, *per se* and all, has been banished to the other side of the Channel. Advantage has been taken of the failure of the Panama Canal to dig itself by lottery to prejudice people against such enterprises in France; but human nature there, as elsewhere, has too much faith in its own good luck to be discouraged by the failures of others; so, in spite of the prejudice that has grown up in the last century against lottery swindles, they still flourish in several European cities; but they all distribute from twenty-one to thirty-three per cent. more of their proceeds than the Louisiana Lottery, and have less to say about charity.

In our own land the lottery has never greatly prospered until in New Orleans it fell into hands whose benevolence has been tempered by audacity. The Louisiana State Lottery Company was founded on the proposition that "every man, woman, and child is at heart something of a gambler," and it has been sustained by the axiom that "every man has his price." This last discovery has been imputed to the present principal owner in the Lottery, but I am not sure that he claims it as his own. He is the acknowledged inventor of the charitable scheme involved in the proposition for a new charter, and his is the only name mentioned in the prospectus. All that has been accomplished, therefore, by the propaganda of the last two years in the legislature has been achieved in his name, when not actually promoted by himself.

It will be no violation of the privacy of so public a character to say that John A. Morris is esteemed by many for his personal qualities and for his readiness to subscribe money to everything that reaches the springs of public influence. Since he has for many years owned property at Throgg's Neck, New York, where he has his country seat, and is now the most considerable Morris in Westchester County, it is natural that a part of the public should associate him with the descendants of Lewis and Gouverneur Morris, the former of whom gained some notoriety by signing a Declaration of Independence. The latter, when Senator of the United States, so a biographer says, "favored the purchase of Louisiana," but it is not recorded that he ever did so out of his own pocket. These Revolutionary Morrisses have always been associated with government which has been called chartered tyranny, or with law, often described as an abridgment of freedom, or with war, which is sometimes called public murder. They are quite distinct from John A. Morris's family, who for many years have been identified in a public-spirited way with the gambling amusements of the masses. John A. Morris inherited his sphere of usefulness from his father, Francis Morris, who is said to have left lottery interests to his son, and who also founded the racing reputation of the family. He was the owner of the noted breeding-farm at Holmdel, New Jersey, and between 1857 and 1859 was associated with Richard Tenbroeck in the effort to carry off the laurels of the English turf with the American horses Prior and Prioress. Francis Morris was the owner of the celebrated brood-mare Barbarity, three of whose daughters were named Ruthless, Remorseless, and Merciless, which shows that, for his time, he had a keen literary sense of the relation of terms to things. In his son's altruistic day the same mare would more appropriately be called Benignity, and her fillies Faith, Hope, and Charity.

In the affidavits of John A. Morris and his associates, made on the occasion of various suits among themselves over the proceeds, the origin of the Louisiana Lottery may be traced back to the Allied Gambling Industries of the country: the lottery, the race-track, and the gambling-house. The headquarters of these industries then, as now, was New York City. In the early days (1863) John A. Morris had lottery interests and turf aspirations, but he did not stand at the head, as he does now, of these two branches. A fortune of at least twenty millions of dollars is attributed to him, mostly earned by the sweat of poor negroes, washerwomen, and other fatuous speculators, through his lottery gambling. He has invested hard upon a million and three quarters in the new race-track called Morris Park, and the breeding-stables of himself and son rank second among those gambling establishments that make a pretense of ennobling the horse.

Early in his lottery dealings we find Mr. Morris standing behind the name of Zachariah Ephraim Simmons, commonly called "Eph," whose surname, thanks also to his brothers, has always been a nosegay in lottery annals. A prominent partner was the Hon. Benjamin Wood, brother of the late statesman Fernando Wood, who in the early days was chiefly devoted to the policy and lottery business, and who for years has made complaint of the manner in which he was ousted from a large interest in the Louisiana Lottery and its charitable reputation.

Another associate was the Hon. John Morrissey, who, notwithstanding that his nose had been damaged during his early career as prize-fighter, was for years the noblest figure in gambling circles. Though Morrissey was a shareholder in the lottery firm of C. H. Murray & Co., his gambling-houses in New York and Saratoga, and his race-track in the latter place, absorbed his personal attention; and in his last years he was slightly diverted from his natural pursuits by the allurements of statesmanship. His gambling-houses and race-track interests have been conserved to the public use, however, by his old-time partner, Charles Reed, Esq., who recently electrified the racing-world by paying \$100,000 for St. Blaise. Mr. Reed's name does not appear in the records of the Lottery, but he is mentioned here as helping to show that the Allied Gambling Industries from which the Louisiana Lottery sprung have great vitality, and may be expected to persist in serving the public. It is possible, indeed, that Mr. Reed, who stands high among roulette and faro gamblers, like many of his craft, looks down upon lottery gambling as "a skin game" unworthy of his serious business aims.

On October 14, 1863, a diversity of lottery interests were combined in New York under the firm-name of C. H. Murray & Co. According to the court records the operations of that firm rested upon charters granted by the legislatures of Missouri, Kentucky, Virginia, Delaware, and Georgia. The original interests assigned to C. H. Murray & Co., for "ten years, from September 1, 1863," were represented in the deed of trust by Richard France and William C. France of Baltimore, and Zachariah E. Simmons, the Hon. Benjamin Wood, and Charles H. Murray of New York, behind whom stood a few other owners. This assignment was denominated a "trust," and was an early example of the kind of trust which has since become notorious in business life. Zachariah E. Simmons, Lewis Davis, and Charles H. Murray were appointed trustees, and it is a sign of the men behind them that in the event of the death of Simmons the vacancy was "to be filled by a successor nominated by John A. Morris, of Throgg's Neck in Westchester County, New York"; while in case of the demise of Lewis Davis the vacancy was to be filled by the Hon. "Ben" Wood, who at that time was very busy in Congress aiding his brother in opposing the war. The prospects of the infant Trust were rosy, but some wicked fairy dropped into its cradle a clause to the effect that any lottery franchise which might be acquired thereafter by any of the parties to the Trust should be forthwith conveyed to the above trustees and held by them subject to the same provisions. This was the seed of trouble. In his demurrer of June 3, 1872, John A. Morris alleged that the firms of Wood, Colton & Co. and Wood, Dickinson & Co. "were shams gotten up" by those men to injure C. H. Murray & Co. In the same paper he avers that while Simmons received from Colton the money to pay for the shares of C. H. Murray & Co. which the "shams" claimed to own, the transaction was really for the account of the Hon. John Morrissey, who, as Mr. Morris intimates in his affidavit, had the inclination as well as the ability to bruise Mr. Colton's head, and, therefore, could not be dealt with directly.

In 1866 and 1867 Charles T. Howard, the most remarkable figure in the Louisiana enterprise after John A. Morris, was operating in New Orleans as the agent of C. H. Murray & Co. In defending one of the suits, Mr. Morris claimed that Howard was not a representative agent, "but only accounted for tickets sold, and paid exorbitant prices for information of drawings of use in his business as policy-dealer," the argument being that because he was plucked, so to speak, by C. H. Murray & Co., he could not have been a full-fledged agent. Howsoever, Howard had busi-

ness, as agent or otherwise, in the lobbies of the negro legislature of the State of Louisiana in 1868, and on the 17th of August that legislature passed "An act to increase the revenues of the State and to authorize the incorporation and establishment of the Louisiana State Lottery Company, and to repeal certain acts now in force." In 1876 Jesse R. Irwin, whose name appears in the act as one of the incorporators, alleged in an affidavit that Howard had used large sums "for bribing members of the General Assembly of Louisiana and other persons, whose influence on behalf of himself or of said company the said Howard wished to purchase or retain"; and that the sums so paid out "amounted to at least \$50,000 during the first year of the organization of the company, which amount was paid to redeem promises made for votes in favor of the bill incorporating the company, and for other similar services." He declared, furthermore, that he believed "the sums so apportioned and used by the said Howard since that time amount to at least \$300,000"; that is, during the first seven years of the company's existence. Another incorporator, F. F. Wilder, made affidavit to the same general facts.

If bribery seems a harsh means to employ with a legislature, it must not be forgotten that beneficent ends were in view, for the act proclaims "that whereas many millions of dollars have been withdrawn from and lost to this State by the sale of Havana, Kentucky, Madrid, and other lottery tickets, policies, combinations, and devices, . . . it shall hereafter be unlawful to sell any of them, . . . except in such manner and by such persons . . . as shall be hereinafter authorized." Only adepts in philanthropic effort could have made so neat an exposé of the harm that may arise to a State from lottery enterprises, and have devised so sovereign a remedy as a lottery monopoly. The act says the objects of the corporation are "to save money to the State," "to establish a reliable home institution for the sale of tickets," and "to provide means to raise a fund for educational and charitable purposes." Another clause provides that "the corporation shall pay to the State \$40,000 per annum, to be credited to the educational fund of the State," and that "the corporation shall be exempt from all taxes and licenses from State, parish, or municipal authorities." As the capital stock was fixed at \$1,000,000, in ten thousand shares of \$100 each, the mind is stupefied with admiration for the sagacity that imposed a gift of \$40,000 a year in return for immunity from all taxes on so large a working capital. Although the act embodies all the virtues of opera bouffe, H. C. Warmoth, who as governor, was at the head of the Louisiana government of those serio-comic

days, neither vetoed the bill nor placed his signature to it, but, by overlooking it for the statutory lapse of time, gave the Lieutenant-Governor (a negro), and the Speaker of the House the honor of certifying it to the people of Louisiana.

Charles T. Howard emerged from the corporation as its president and F. F. Wilder as secretary. John A. Morris, as he says in his demurrer of June 3, 1872, happened to be in New Orleans about the time the Lottery Act was passed, and suggested to the company that he would furnish the \$100,000 of capital required to be paid in before the company could begin operations, provided that all the privileges of the charter were given to him and two associates by a deed of trust. The company would appear to have been foreordained to acquiesce, for on August 26, nine days after the act passed the legislature, the corporation signed away all the rights of the company for twenty-four years, from January 1, 1869, to Z. E. Simmons, John A. Morris, and Charles H. Murray. Charles T. Howard as its president obviously could not sign away the rights of the corporation to himself, but as soon as the Trust was legally established, some transformations were effected which revealed the corporation in its true light as a mask for the Trust, which assumed the title of Howard, Simmons & Co. In 1872 Murray and Simmons withdrew, or were bought out, and Howard assumed the duties of "managing partner" to John A. Morris.

Thereafter Zachariah E. Simmons was in a position to reveal the secrets of the Lottery councils, which he did when Marcus Cicero Stanley brought suit in 1880 as an owner in C. H. Murray & Co., which firm, by the way, had been thrown into the hands of the Hon. John Morrissey, as receiver, in 1869, and its assets closed out to W. L. Simmons, brother of the outspoken Zachariah. The latter, in bringing aid and comfort to Stanley, swore that the money used to secure the charter in Louisiana really belonged to C. H. Murray & Co. (in opposition to Morris's allegations given above), and that he (Simmons), Murray, and Morris devised a plan to deprive that firm of its benefits. He alleged also that Morris and his brother-in-law, W. D. Hennon, were sent to New Orleans expressly to represent C. H. Murray & Co. in response to a telegram from C. T. Howard. And as though this would not bring confusion enough to his old partners, he alleged besides that Howard as president refused to sign away the privileges of the corporation unless Simmons, Morris, and Murray would give him a quarter interest in the Trust, which, as soon as the promise was fulfilled, was called Howard, Simmons & Co. Thus we see how the Lottery Company came to be a mask for the ultimate owners, Howard and Morris. The fiction

of a company has been kept up to this day, a fiction in everything except as to its stock and the ability of the postal authorities to proceed against its officers for infractions of the postal laws, which is now being done. During his lifetime Charles T. Howard was its figurehead president; after his death M. A. Dauphin lent his name to the same purposes; and on his recent demise Paul Conrad assumed the rôle of chief marionette: for the deed of trust left the corporation neither duties nor obligations, nor any privilege except the right to name a commissioner to superintend drawings, and to see that the prizes were distributed; and of course the trustees took care also to hold a controlling interest in the stock. The incorporators Jesse R. Irwin and F. F. Wilder alleged in 1876 that in the early days Howard set aside a very large sum as a "reserve" (in New Orleans jocularly called the bribery fund), and by other measures depressed the stock to half its face value with a view to buying it in. They allege also that he distributed 6800 shares as full-paid stock among the directors, and 3200 shares in some manner not known to them or relished by them.

The supremacy of Howard and Morris under the deed of trust is best indicated by the provisions for dividing the profits. Out of the gross proceeds were to be paid all the cost of carrying on the business, such as working expenses, including, of course, advertising, salaries, and the cost of maintaining the friendliness of the press and the legislatures; of the remainder, or net profits, one half was to be taken by the trustees, and the other half declared as a dividend on the company's stock. The profitability of the business is partly indicated by the fact that the remnant distributed among the stockholders in 1887 was 110 per cent. on a capital of \$1,000,000; in 1888 it was 120 per cent., in 1889 (before the postal law became an interference) 170 per cent., and in 1890 it was 125 per cent. These figures have been furnished by a person who controls some of the stock; they represent the payments made to his wards. They show that in 1889 the net profits as revealed to the stockholders were \$3,400,000. Nobody outside the trustees and their confidential employees, not even the stockholders, seems to know whether the remnant divided as dividends is one half or one tenth of the net profits of the whole concern, because the power of the trustees is limitless, the opportunity for piling up "reserves" is great, and the machinery of the semiannual, monthly, and daily drawings and the daily policy business is complicated; and, furthermore, before a stockholder is able to draw his fractional remnant, it is said he must sign a receipt by which he disposes in legal form of all rights except the right to the fractional remnant and consents to the

destruction of the accounts, which he has never seen. However, the number of people in the United States who would accept 170 per cent., even though it were a fractional remnant, and agree to any amount of invisible "addition, division, and silence," is supposed to be large.

The Lottery prospered from the start, but the brilliant idea of utilizing two of the great names of the Confederacy then in need of occupation, but all the more sacred for that, and of extending the business to every town in the United States and to foreign countries, was not fully developed until the early seventies. By that time Morris and Howard's old partners in New York began to sniff carrion off the trade-winds from the Gulf. The Hon. Benjamin Wood and Henry Colton were the first to get within toothsome distance. On January 5, 1871, they filed a bill in the United States Circuit Court for Louisiana, in which, as members of the old Murray Trust, they laid claim to shares in the profits of the Louisiana Lottery. The suit was defended by pleading the immorality of the business engagements alleged by Wood and Colton. Murray charged these two with being parties to a lottery scheme which was "illegal, corrupt, against the policy of the State and the public order," and with attempting "to establish a monopoly of the trade of gambling in lotteries throughout the United States, prejudicial to law and morals"; and he asked the court to punish the complainants on their own showing. This, of course, was great fun for both sides, like laying the corner-stone of a gambling-house with religious rites, or opening a horse-race with prayer. It is not known whether Mr. Morris adopted the same facetious tone in his answer, because that document has absented itself from the records of the court. The suit was never pressed, perhaps for the reason mentioned by Morris in his demurrer to the next attack, made March 9, 1872, by James S. Watson, and Marcus A. Little of New York, and William R. McKee of Maryland. In that case he offered the defense that they never properly held an interest in the Murray Trust, which made the immorality plea unnecessary; and possibly for the latter reason his answer in the suit has consented to remain on file among the court records. But the point of chief interest in Morris's answer is his statement that associates in the Murray Trust, who had not lent a helping hand when the Louisiana Lottery was in its infancy, had, as soon as it proved a success, begun to harass its owners in Federal and State courts, and that "said Morris, Murray, Howard, and Simmons were induced as a matter of economy to buy their peace by compromising said pretended claims." An exhibit attached shows that Howard and Murray had compromised

with Henry Colton by the payment of \$36,000. On the same date as this last suit, Little and McKee began a similar attack on Howard, Wilder, Murray, and Davis. The demurrer of Howard and F. F. Wilder is the blandest document remaining on file in these suits in November, 1891 (I mention the date because it may take the notion to absent itself in the near future). In this paragon of frankness Howard and Wilder, "not confessing or acknowledging all or any of the matters" stated in the complaint, aver "that the subject-matter of complainants' bill, on which their prayer for discovery and relief is based, arises from transactions, contracts, and business reprobated by law and contrary to public policy and good morals." The Hon. Benjamin Wood, having grown weary of the truce established by his suit in 1871, filed a new petition on June 19, 1875. This contention was shuttlecocked until the state of war faded away into the peace that passeth understanding except for Mr. Morris's explanation of their policy of compromise as a matter of economy.

None of the defendants' answers in this last suit remain on file in the clerk's office of the United States Circuit Court in New Orleans. I asked the officer in charge if care were not taken to preserve the records of the court. He replied that persons asking to see the records were helped to them as I had been, and if they had a mind to slip them into their pockets, so much the worse for the records. He informed me that my opportunities were as good as anybody's, yet I contented myself with taking copies and notes of such documents as were still on file. A search in the office of the County Clerk in New York reveals a similar state of absenteeism on the part of important documents in the Lottery suits brought in the Supreme Court of New York. The custodian said: "I would n't be surprised by anything that might happen to the records of those suits." On the other hand, the Lottery records in the United States Circuit Court for the Southern District of New York appear to be carefully guarded.

In 1876 an attempt was made by Henry Da Ponte, owning sixty shares of the stock, to have the contract which gave all power and half the profits to Howard and Morris set aside by the courts. He was joined in this family row by Jesse R. Irwin, an original director, and by F. F. Wilder, who, in addition to being an original director, had served the corporation as secretary, treasurer, and superintendent, and was in a position to allege that some of the directors were only nominal stockholders holding really for Howard, and that, while he was the ostensible treasurer of the company, not a dollar came into his hands, the whole financial busi-

ness of the company having been conducted by Howard. The revelations of stock distributions and wholesale bribery alleged by these two incorporators have already been set forth. This suit was never tried, but the initial steps appeared to cement the friendship of Howard and Morris for Da Ponte, who has ever since stood high in Lottery circles.

And again comes Z. E. Simmons, the faithful Zachariah of Murray Trust days, the coadjutor of 1868, who, in a suit now pending in the United States Circuit Court in New York, has had testimony wrung from him to the disadvantage of his old friends Murray and Morris, and in aid of the heirs of Isaac Bernstein. Mr. Morris puts in a simple plea of being a citizen of New York, and not of Louisiana, as alleged by the complainants. On this score he pleads lack of jurisdiction. Mr. Murray, who husbands his savings, reckoned at several millions, in New Jersey, in part sets up his old plea that the Lottery contracts were "illegal and void."

Though a fruitful theme, the campaign of 1879, by which the Lottery secured a lodgment in the State constitution, can be touched here but briefly. Everybody knows that Louisiana was ruled for years by colored statesmen and white carpet-baggers, and that a shot-gun cataclysm in 1874 was the sad origin of a new era. Although the Lottery people had begun to take an intimate interest in State politics, they had the merit of belonging to both political parties. But arrange matters as they might in each legislative session there would be somebody to introduce a bill granting a new lottery charter, or withdrawing the old one. Only one of these measures, for surmisable reasons, prospered beyond a certain stage. In 1876 General Francis T. Nicholls, who had left both an arm and a leg between the Rapidan and Petersburg, was nominated for Governor and was elected. Some whole veterans in Louisiana earn wages from the Lottery. Being only half a veteran, the Governor was not at heart sound on the Lottery question; so, when the legislature in the spring of 1879 actually rescinded the charter of the Lottery Company, Governor Nicholls signed the bill with his remaining arm. A Creole once implied approval of General Robert E. Lee by saying, "I hear Gen'l Beauregar" speak well of him." Up to the signing of that bill, Beauregard's employers had spoken well of General Nicholls, but now such words as "scoundrel" and "traitor" were heard; they claimed to have contributed large sums for the sustaining of his government, as when thirty-two colored statesmen were induced at large expense to leave the rival "Packard Legislature," thereby depriving it of a quorum. But the repeal of the Lottery charter was annulled by an injunction

issued by Judge Billings of the United States Circuit Court, who took ground at variance with decisions of the Supreme Court of the United States. And as a constitutional convention was called for the autumn of that year (1879), the Lottery very soon perceived a way to fortify itself further. Powerful interests were at work for selfish ends, and the Lottery at once allied itself with them. A strong lobby had been formed particularly in the interest of the re-funding bondholders of the Kellogg régime. New bonds had been issued to conceal the identity of millions of bonds which were regarded as fraudulent, and for that reason there was a move to repudiate them. These allied interests carried the day in the convention, from which the Lottery emerged with a limited berth in the fundamental law of the State. Article 167 of the new constitution says: "And the charter of said [Lottery] Company is recognized as a contract binding on the State for the period therein specified [until January 1, 1894], except its monopoly clause, which is hereby abrogated, and all laws contrary to the provisions of this article are hereby declared null and void, *provided* said company shall file a renunciation of all its monopoly features." The lottery *renounced*, with a flourish of trumpets, and even talked approvingly of another clause which provided that all lottery "charters shall close and expire on the 1st of January, 1895, from which time all lotteries are prohibited in the State." The picayune offering of \$40,000 a year in lieu of all taxes was not increased, but was given the distinct stamp of philanthropy by allotment to the Charity Hospital of New Orleans.

Though the new constitution meditated the chartering of new lotteries, and although legislators were always seeking to introduce such bills, the magnetic influence of the State Lottery was equal to the task of keeping the field to itself, and for another ten years it has rioted in its millions of profits and its benevolence of \$40,000 a year.

It was only after the Lottery, by the renunciations mentioned above, had made its peace with some of the best people of the State that John A. Morris came out prominently as a pillar of the institution. He had spent his winters in New Orleans, and as a gentleman of leisure had been elected to some of the best clubs, but was not generally known as the right bower of Charles T. Howard. The latter gentleman had been Lord of the Lottery, and certainly no knight of old, of the bar sinister or otherwise, ever carried his authority with greater aplomb. Charles T. Howard was a large, commanding figure whose gray hair and general aspect would, after the traditions of romance, have likened him to a handsome gambler. Those who knew him well say he was fitted to be the

hero of such a great epic as Milton's "Paradise Lost." He aimed at success, not glory. When the Metairie Racing Club, famous for the race of Lexington and Lecompte in 1853, treated his candidacy for membership with an indifference bordering on disdain, he quietly served notice that he would turn their race-course into a graveyard, and he did. This was not building a mansion in the skies, but at least it bore the look of preparing a way-station. When a place of respectable amusement on Canal street extended the cold shoulder toward him, he volunteered to convert it into something more to his taste; but he did not live to see his full hopes realized. He was killed, half a dozen years ago, by being thrown from his horse at Dobbs Ferry, New York, where he had a summer home. His tomb is a notable one in Metairie Cemetery, the finest "city of the dead" in New Orleans, where some of the heroes of the Confederacy are commemorated by statue and monument. Mr. Howard loved the dignifying memories of the war, and had himself elected a member of the Society of the Army of Tennessee. Some claimed that, as orderly sergeant, he had served at Shiloh. Though his election to the Army of Tennessee led to the resignation of two of its prominent officers, the practical work of the society was advanced by his munificence. It is said to have been his wish that his heirs should provide a home for the Louisiana Historical Association. They have done so handsomely, in a building that cost \$20,000, where the veterans meet, where relics of the war are kept, and where the purposes of history are efficiently served. This Veterans' Hall is an annex to the handsomest public building in New Orleans, the "Howard Memorial," dedicated to the memory of the philanthropist under discussion, on which over \$100,000 was spent, and which in every detail of construction and furnishing is a model public library. It stands almost in the shadow (if the sun were not on the wrong side) of the austere figure of Robert E. Lee, towering on the column in Lee Circle. Only esteem can be felt for the filial act which devoted these buildings to a father's memory. It is the single unselfish benefit that Lottery money has conferred upon New Orleans, whose people have been impoverished by the daily drawings; and no doubt the heirs would be glad if they could disassociate from the gift its mute influence as a bribe to public respect on behalf of a gambling corporation.

For ten years the Lottery owners have prepared for the struggle which is now at its height, and which is to result in the further degradation of the State, or in the death of the monster after 1893. They long assumed content with the provision abolishing all lotteries after January

1, 1895. Before that time, they said, they would have money enough. So they gathered in five to thirteen millions a year,—nobody knows how much, but their schemes on their face prove that the highest sum is possible,—and began to intrench their power. Lottery money flows in almost every channel of trade and manufacture in New Orleans, even of the State. Some of the leading banks that dominate the reserve capital of the State are allies of the Lottery. The anti-lottery leaders claim that many depositors and borrowers who at heart are opposed to the proposition for a new charter, are constrained to conceal their opposition by fear that they might be denied credit on favorable terms. Four national banks are advertised sponsors of the Lottery, and, besides the certificate of Generals Beauregard and Early, each lottery ticket carries on its back the guarantee of "R. M. Walmsley, President Louisiana National Bank; P. Lanaux, President State National Bank; A. Baldwin, President New Orleans National Bank; Carl Kohn, President Union National Bank." The New Orleans National Bank is the declared cover of the Lottery mail under the new postal regulations. The president, Albert Baldwin, who is the leading merchant and banker in New Orleans, is supposed to be a large owner of Lottery stock, as well as one of the six unnamed incorporators of the proposed new charter. He is an ardent Republican, just as John A. Morris is an ardent Democrat. Baldwin's reputed large gift to the Harrison campaign fund, be it said in justice to the Administration, along with other powerful influences, was not sufficient to keep the recent postmaster in his place for more than a year and a half after the new régime came in. This postmaster was appointed under President Cleveland, and was not suspected until the end of the latter's term to be one of Morris's friendly assistants. Because of his high character, and his social relations with the best people of the State, the urgent popular demand for his appointment to the guardianship, as it were, of the Lottery mail, bore a public-spirited aspect. The colored statesman, Ex-Governor Pinchback, is also regarded as one of the political pillars of the Lottery, and is supposed to be a large stockholder.

Lottery capital controls the water-works that sustain the living, and Metairie Cemetery, the home of the aristocratic dead; it supports the old French opera-house, the rendezvous of the best, and it is a brilliant, society; it turns the great cotton-mills, and has built a large plant which is the initial experiment of taking the manufacture of sugar off the hands of planters. It was a hobby of the Hon. Don Caffrey that if central mills for the grinding of cane could be set up independently of

the planters, the latter would be relieved of a large business burden. When Mr. Morris learned through one of his friends of Mr. Caffrey's desires, he took hold of the subject with enthusiasm, furnished the capital, placed Mr. Caffrey at the head of the concern, and then saw the coveted lawyer withdraw in haste when the duty of the head of the enterprise to the Lottery propaganda was foreshadowed. Mr. Caffrey's eloquence in favor of the Lottery, or even his silence, would have been an ally to prize; his active hostility has been a tower of strength to those who are trying to rid the State of the blight of Lottery charity.

Then there is the Lottery "reserve fund." We have seen that long before 1876 it amounted to hundreds of thousands of dollars. By the habit of the trust-owners it may be increased each year out of the gross receipts, before half of the net profits are doled out to the stockholders. That it is an enormous fund is evident from the demands upon it; and it is well known that in its idle moments it has been augmented by investments in real estate and as interest-bearing capital, which reminds one of Gilbert's optimistic lines: "When the coster is n't jumping on his mother he loves to lie a-basking in the sun." It is the duty of this reserve fund to grease the wheels of both political machines through the regular channels, and to feed the ambition of all sorts of big and little, better and rougher, political bosses by private subscriptions; to aid the influential who are needy, and the unscrupulous who are useful; to quicken the wisdom of the press, which in its secular aspect in the State is 173 for the Lottery to 28 against; to compromise with legislators so that no rivals shall enter the field; in brief, to make the Lottery a perfume in the nostrils of influential people in every walk of life. The number of regular pensioners on the fund is believed to be enormous: some are parasites, and others are quickened into silent or audible advocates. The avenues of employment are a powerful lever also for indirect influence. In the main lottery-offices are innumerable employees, often poor relatives of influential people who are thereby kept in a state of moral coma. The 108 suboffices of the "daily drawing" and its attendant "policy" business are let to outside persons, and are sources of large profit. Two or three members of the legislature are known to occupy suboffices by proxy. When application is made to fill a vacancy, or to open a new office, it is said that if the aspirant does not bring a recommendation from two members of the legislature, he must have other powerful influence, or be foreordained to failure. These suboffices do not include the myriads of agencies at cigar-stands, barber-shops, and other stalls, where

a commission of 15 per cent. helps to keep another army of somebody's friends or poor relatives in a maintenance. Many an advocate of the Lottery on charitable grounds has proven later to be a pampered stockholder. A prominent case was the president of the leading social club, who was also a surgeon of more than Southern fame. He gave quiet help in getting the Lottery into the Constitution of 1879. When he died, after an extravagant life, almost his entire fortune was found to consist of Lottery stock.

When the campaign for governor and a new legislature opened four years ago, John A. Morris buckled on his armor because he had made up his mind to serve the State by applying for a new lease of Lottery life. It is a peculiarity of Louisiana politics that the governor who is in is unpopular, and the governor who is out arouses enthusiasm. Governor Samuel D. McEnery was a candidate for a re-nomination. The Lottery was looked upon as his friend, although in a message in 1882 he had said: "The constitution declares gambling to be a vice, yet it encourages that vice in its worst forms, not only inciting to breaches of faith and embezzlement in the effort to get rich in the turn of a wheel, but demoralizing society, corrupting politics, and impeding legislation." Nine years later, from the Supreme Bench, Justice McEnery, by his decision and that of two associates, placed the Lottery amendment before the people; and now, by the nomination of December 18, 1891, he is the candidate for governor of every pro-lottery Democrat in the State. Against him are arrayed the anti-lottery Democrats and the Farmers' Alliance, who on the same day nominated the leader of the Anti-Lottery League, Murphy J. Foster, a State senator of commanding ability and proved integrity. This split in the Democratic party gives the Republicans a variety of opportunities, and as many of their influential leaders and legislators have always aided the Lottery, the situation has an aspect of humor and victory to John A. Morris and his six concealed coadjutors, whether or not the Lottery Republicans bolt in McEnery's interest or join in electing a straight Republican ticket. The Lottery people claim that the contest is a political squabble for offices, but everybody knows that the Lottery amendment is the great issue involved.

When McEnery lost the nomination four years ago, Governor Nicholls came again into power. Toward the end of the latter's canvass, when success was apparent, the Lottery insinuated \$10,000 into his campaign fund, but not with his knowledge. With the end of winter, in 1890, came an awful flood, the ever-threatening demon of the Lower Missis-

siippi. Levees were swept away, planters were in distress, and a peremptory cry for help arose to which Governor Nicholls could not immediately respond without violating his oath. When the clamor was at its height, the Lottery sent him a check for \$100,000. This Governor Nicholls returned. He was willing to see the State disappear in a crevasse before he would save it with Lottery money. This was the Lottery's opportunity to put him in a crevasse, and Mr. Morris's agents promptly sent checks of proportionate size to every levee officer in the suffering section, only one of which was returned. They also loaded several steamboats with supplies for the people of the inundated regions, and when the flood subsided spent thousands of dollars in distributing seed. In 1890, \$50,000 was given to New Orleans for levees. This large-heartedness was all the more noticeable because the Lottery had seen several floods come and go in the past without signs of sympathy. It is said that Lottery money built two churches; and as though charity were a disease that feeds on itself, the Lottery began to distribute a few other "capital prizes," some of which were not accepted. When an offer was made to relieve the diocese of New Orleans of its debts, the Archbishop declined this *per se* emanation from the Lottery; when a shaft of \$5000 was aimed at the Normal School at Natchitoches, it was warded off with the cold shoulder. When the Sanitary Board of New Orleans was offered \$30,000, partly for public bath-houses and in part for the indispensable summer work of flushing the gutters, the Board received the gift in spite of the protests and resignations of members who "would not indorse the Lottery as a charitable institution to the children of New Orleans, for \$30,000."

In laying the foundation for influence in the legislature of 1890, the Lottery had the help of all the hack political bosses, and of some private agents of social position. The dread of political domination by bosses is very strong in Louisiana; and it is said that John A. Morris, on appealing personally to Senator Avery of Iberia parish to support the amendment, reached a condition of moral fervor in which he declared "it would be a crime to refuse this great benefaction to suffering Louisiana." "Mr. Morris," said the Senator, "even of my kinsmen were killed at Fort Griswold by Benedict Arnold, in their effort to rid this country of one-man power; I and my kinsmen have fought for the State of Louisiana, and there is no influence strong enough to make me vote to place this State in the power of one man, whether he be you or somebody else."

This was the summer of 1890. Governor Nicholls had anticipated the "Revenue Amendment," which is the sugar-coated popular title

of the Lottery bill, by marshaling, in his message to the legislature, every reason in common morals and State policy why it should be voted down. Nevertheless, the "Revenue Amendment" was brought before the legislature, and such a struggle as Louisiana had never seen before was begun. As adopted it proposes a new article for the constitution of the State, to be voted upon in April, 1892. It is called "Article on Levees, Schools, Charities, Pensions, Drainage, Lotteries, and General Fund." It seeks to reestablish the Lottery for twenty-five years, from January 1, 1894, in the name of John A. Morris and six other persons *hereafter to be revealed*. In consideration of the "contract" (no charter this time) John A. Morris is to undertake that during the life of the Lottery \$31,250,000 shall be paid to the State in yearly parts of \$1,250,000, the latter sum to be apportioned (in quarterly payments) as follows: \$350,000 to the public schools; \$350,000 to the levees; \$80,000 to State hospitals; \$40,000 to State insane asylums; \$25,000 for the deaf, dumb, and blind; \$5,000 to the Soldiers' Home (a State institution); \$50,000 for pensions to "disabled, infirm, or indigent Confederate soldiers (as there is no State pension fund at present, the shrewdness of this bribe is obvious); \$100,000 to the city of New Orleans for drainage and other sanitary purposes; and \$250,000 to the general fund of the State. Rival lotteries are effectually shut out by the necessity of coming into life in the same way and of paying an equal amount to the State. The company, besides, is to be exempt from taxation; but the sum of \$1,250,000 is not far from the equitable taxes on the new capitalization at the premium value of its stock, according to the present laws.

At first the legislature was tempted with \$500,000 a year, but as one member thought his scruples could not be overcome by less than \$1,250,000, and as others deemed it wiser to confront their constituents with that sum behind them, Mr. Morris good-naturedly consented. What was a million, more or less, to him, when all this money was coming out of the pockets of the people it was supposed to benefit, along with as much more to line his own pockets! A word like "selferosity" should be invented to express such boundless love of mankind. The delusion of those statesmen may be inferred from the fact that \$1,250,000 is not far from the present State taxation; but they were told by the Lottery that 93 per cent. of all its business comes from outside the State; yet it is a demonstrable fact, on the theory that each of its 108 local policy-shops brings in a business of \$60 a day (which is said to be the minimum tolerated, a shop being moved or the management changed if the income is

less), that the local daily drawing will more than pay the new obligation to the State, showing that it will really come out of the pockets of Louisianians, and from the class least able to pay it. But could anything be more fascinating as a bribe to the average citizen than the abrogation of all taxes? Some very good men in Louisiana have persuaded themselves that this is the real and not the apparent effect of the "Revenue Amendment." They do not see, among other incongruities, that in public schools supported by the Lottery, the teachers might properly be agents for the sale of tickets, and that it would be laudable for the pupils to economize on luncheons so that during a week they might save the price of at least one ticket.

As an amendment to the constitution the bill could be passed only by a two-thirds vote in each house. For a time the Lottery was slightly in arrears. All of the colored brethren were on its side, in plenty of white company. Little by little the opposition saw their forces flowing to the Lottery side, a final sign of weakness being the plea that support of the bill was, after all, only saying to the constituencies, "If you don't want this Lottery, don't vote for the amendment." A member who yielded to this plea said he would rather his son should die than be educated by that fund. At the critical moment the anti-lottery members in caucus pledged their sacred honor not to be bought or wheedled into support of the bill. A senator who had given that pledge, who had been impoverished, who was in poor health and harassed as to the support of his family, was the last man needed for a Lottery victory. He voted to submit the question to the people, sank into his chair, and in shame buried his face in his hands. Nearly a year afterward this pitiable man was carried ill to the Hôtel Dieu in New Orleans. After his death a belt containing \$18,000 was found on his person, and was considered to be the remaining part of a larger sum. A relative published a defense to the effect that he voted according to his convictions, but did not deny that the money was found upon him. There was a white Baptist minister in the legislature who voted for the bill, it was said, because the Lottery had subscribed to his church. He was turned out of his church and afterward out of the denomination. Symptoms of sudden wealth broke out on many members, previously poor, who are mentioned by name in the talk of the town.

Amid much jubilation, on that great day for charity, the bill was sent to Governor Nicholls, who returned it, on July 7, with his veto. The House lost no time on the following day in passing it over the Governor's head by a vote of sixty-six to thirty-one, one member being absent. The Senate would doubtless have followed suit but for an unforeseen accident. One

of its members had been to New Orleans on the wings of victory, where he had acquired a state of delirium tremens. His vote was needed to override the veto, and his physician had declared that his life would be forfeited, probably, if he were carried to the Senate. Nevertheless, his wife is said to have favored the attempt; an effort was made to get the use of the Lieutenant-Governor's room for his accommodation; then it was suggested that the Senate should meet where the sick man lay. But the opposition threatened to investigate the ability of the man to cast a legal vote. The man died, and in desperation the Lottery senators decided that as the bill had already been passed by a two-thirds vote it was unnecessary to submit it to the Governor for approval. The House adopted this view; and when the Secretary of State declined to certify the bill on that ground, and for the reason that alterations and changes in the journals of the two houses, regarding the bill, had been made without proper authority, the Supreme Court of the State, by a three to two judgment (Associate Justice McEnery concurring), set aside both objections, and the bill was promulgated. In such trappings of fact does John A. Morris's Child of Charity appear before the altar of manhood suffrage for consecration.

A month after their defeat, a convention of the Anti-Lottery League met in Baton Rouge. Such able speakers as Murphy J. Foster (the leader in the Senate), Judge E. D. White (now United States senator elect), Edgar H. Farrar, and Charles Parlange made the air red with eloquence and blue with the moralities of the question. Mr. Farrar has since led in a campaign of hard facts to show that the city and State are prosperous, not poor, and to expose the fallacy of the Lottery on business principles. United States Senator Gibson has also turned his logic against the amendment. The league was formed in New Orleans in April, 1890, by Judge White, Colonel J. Davidson Hill, Judge Frank McGloin, Colonel C. Harrison Parker, Judge F. A. Monroe, Colonel W. G. Vincent, and Senator Charles Parlange. Hundreds of men prominent in the law, in education, and in business, like the attorney-general, Walter H. Rogers, the Hon. Don Caffrey, the Rev. Dr. B. M. Palmer, Colonel William Preston Johnston, and Branch M. King, have rallied to it. Foremost among them are men who wore the same uniform as Generals Beauregard and Early, but who spurn the idea of salaries or pensions from the Lottery. They are determined men, and have enlisted their lives and whatever fortune they possess in the cause of restoring Louisiana to the sisterhood of respectable States.

As the Lottery question pervades church and society in New Orleans, it is not surprising that

the women have formed a league of their own, with branches in all the parishes. Mrs. William Preston Johnston is president, and the parent branch of New Orleans in November numbered 700. These women are earnest and outspoken. An incident in the autumn was the offering by a member of her only valuable piece of jewelry, a gold watch, which she asked the finance committee to sell for the benefit of the fund.

The only real setback to the Lottery has come from the new postal regulations. At various times since 1883, Inspector George A. Dice has done efficient work in obtaining evidence of violations of the postal law, but in every instance the United States Court in New Orleans proved an obstacle to conviction, so liable is the ermine to lose its luster in a Lottery atmosphere. Finally, Congress passed a new law in September, 1890, which made it possible to prosecute for the posting of lottery tickets or advertisements, along the route or at the destination. The day that law was signed, Mr. Dice heard a salute of one hundred guns fired in New Orleans by the anti-lotteryites in honor of their first and only success. Inspector George C. Maynard has since picketed the Gulf district, and, in addition to the Louisiana Lottery, has had also to watch the Juarez Lottery, a Mexican concern to which Confederate General John S. Mosby is commissioner. Mexico is a paradise for gamblers. A traveler who has just returned says that at a watering-place in that country he entered a tent in one end of which was a gaming-table for adults, while in the other end was a table for youths; a pawnshop occupied the center.

At the New Orleans post-office, in ten days prior to the passage of the new law, the Lottery Company received 30,000 letters; in the same time the New Orleans National, the Lottery bank, received 8464 registered letters. For ten days in July, 1891, the Lottery received only 534 letters, and the bank only 41 registered letters. One third of the New Orleans mail formerly went to the Lottery, the receipts of the post-office on that account alone amounting to \$125,000 a year. Postmaster-General Wanamaker, who has sustained the new law with untiring energy, says in his last report: "The mails are no longer used by the Louisiana State Lottery Company for the transmission of printed matter in packages or unsealed envelopes. Its patronage of the post is now limited to letters and packages under seal, and I have reason to believe that such matter is sent only to points that can not easily be reached by the express companies. Statistics show that during the calendar year of 1889 there were received at the Dead Letter Office 11,266 Lottery letters, or an average of 938 letters per month. During

the first six months of 1890, 5686 Lottery letters were received, or an average of 947 per month. During the next five months of the same year—these include about two and a half months succeeding the date of the approval of the Anti-lottery Act—there were received 2597 letters, or an average of 519 per month. During the eleven months beginning with December, 1890, and ending with October, 1891, 686 letters containing lottery tickets were received, an average of only 62 per month. At present the average is less than 40."

If necessary, the Lottery would no doubt conduct its carrying business by pony-express or even by foot-messengers; but just at present it finds the express companies a handy agency, against whom, however, the Postmaster-General is preparing legal warfare. Of the extent of the express traffic he says in his report: "Some of the expresses have instructed their agents and employés to refuse the business of the Louisiana Lottery, but the instructions are ineffective, because packages are sometimes smuggled into the express by persons not known to be connected with the Lottery, but more frequently because the employé is either indifferent to his instructions or in sympathy with the Lottery; and it is not disputed that such matter is received and conveyed without dissent by express companies professing to refuse it, when offered by connecting lines forming a part of the entire route over which it is to be carried. Other companies, as for instance the Southern Express, openly receive and transport all printed matter offered by the Lottery Company and its agents, sealed or unsealed, and all sealed packages, presumably of written or partly written matter, insisting that they are prevented from either making special inquiry as to the contents of the packages or disturbing the seal."

In the past, as at present, the Lottery mail has been the chief source of corruption to the postal employees, and to an extent which official prudence, to aid its detective work, has felt bound to conceal. But the facts are astounding. With the purpose of discrediting the New Orleans post-office, the Lottery bank has recently charged indifference on the part of the authorities, who are obliged to work in quiet, and who have no surveillance over the employees of the bank; for the Lottery mail corrupts alike those that handle and those that receive it. An account of the subterfuges of the Lottery to evade the postal law would fill a volume. Some of their home journals in the Lottery interest are making a desperate assault on the constitutionality of the law, for excluding from the mails newspapers that print Lottery advertisements. The case was argued in November, and in the middle of December the decision had not yet been rendered. That pub-

lic opinion strongly favors the exclusion of Lottery matter from the mails is indicated, the Postmaster-General says, by the fact that "of the 2259 newspaper editorials, published in 850 papers, which have come to the notice of the Department during the past year, 2172 have opposed the use of the mails by lotteries, and 87 have favored it." It would be interesting to know how many of the 87 were printed outside Louisiana.

A year and a half of public arguments and appeals have had no effect on lottery-workers and respectable sympathizers; either the Lottery *per se* or the supposed tax-paying power of the "Revenue Amendment" has full command of their influence. The sole hope of the Anti-Lottery League is with the people of the parishes; in New Orleans it has only a strong fighting minority, made up of the better elements, but they are men who cannot be trifled with, and who mean to have fair play at the polls. Their home money resources are nearly exhausted, for they are men of moderate means. One member subscribed \$15,000, and others according to their ability. To get a hearing in the press, they were compelled to start, in May, 1890, the "New Delta," which is ably edited by Colonel J. Harrison Parker and Colonel John C. Wickliffe. Every week a committee canvasses for funds to keep this necessary agency up to its vital work, while the old-established newspapers draw sustenance from the Lottery's advertisements, and give the impression that the power and prestige of the State are all for the Lottery bill.

With millions of Lottery money to contend against, and with lessening resources, the League has in desperation collected its Winchester rifles, which were kept under cover near every polling-place during the white primary election of November 10; for it was doubted if the Lottery's ward bosses and heelers would count their votes in case the election was close. No law-abiding citizen can approve of the mob of last spring, that taught the Mafia its terrible lesson; but no citizen of the North can understand, except on the ground, the provocations of the would-be law-abiding people of New Orleans. In this fight all of the various Mafias are on the side of the Lottery, which is the masterful vampire Mafia of them all. W. S. Parkerson, the leader of the men who marched to the parish prison and who has been prominent in the movement to crush out corrupt boss rule in local politics, came into the League as soon as he found that the bosses were to a man in the Lottery camp. Another sign of the desperation of the League is its appeal for outside money support. The good people of New Orleans have the habit of depending upon themselves, but in the hour of exhaustion they are

willing to beg for this cause, and General George D. Johnston was sent to New York to ask for aid, the great mass-meeting of November 13 being the first response to his efforts.

Some have thought that abuses at the North ought first to be righted before aid should be sent South; for few understand to what an extent this is a national question, so silent and insidious has been the spread of lottery gambling. *It is, first and last, a national question!* New Orleans is only an incident. In justice to Louisiana, the whole North ought to lead in this fight—with its support when the battle is in New Orleans, and in Congress if the victory in April is with the Lottery. Has not the Lottery proclaimed that ninety-three per cent. of its business comes from abroad? Within a year it has made a desperate attempt to obtain a charter from North Dakota, as a refuge in case it should fail to get a new footing in Louisiana. A journalist, traveling last autumn in the Canadian Northwest, was asked by his guide to withhold his pay till it amounted to five dollars, with which he intended to buy a Louisiana Lottery ticket. New York hatched this Lottery, and New York, in spite of the postal law and the police, is to-day its main dependence. The dishonest real-estate clerk who, two or three years ago, robbed a prominent New York law firm of upward of \$250,000, confessed that most of the money was lost in policy and lottery gambling. Boston, New Haven, Philadelphia, Buffalo, Washington, Cincinnati, Kansas City, Denver, and San Francisco are hotbeds of its virus. On my way to New Orleans I visited Detroit, where the Lottery agents are active but under cover. In Chicago the inspector of police from his office in the City Hall, in answer to my inquiry, pointed to a doorway opposite his window, and through that doorway I walked into a room off a side hall where lottery tickets were being sold openly, and where a silent file of youths and men followed each other in and out. On the wall were rough placards giving the names of recent drawers of portions of "capital prizes" in two large manufacturing houses. These I visited, to find that the facts were as stated. At one place the proprietors were unfriendly to the business; in the other the sentiment was favorable. The havoc of the Lottery in Chicago was attested by stories of riotous living and ruin wrought by lucky tickets, and by several cases in which the police had been debauched. Two years ago a policeman won part of a capital prize, set up a saloon called the "Louisiana," soon ran through the money, and was welcomed back

to the police force. The sensation while I was there was the recent "breaking" of a detective who had been caught by his "partner detective" (a new man of firm character) taking bribes of tickets and money from the Lottery's chief agent, who keeps the office described above. The agent was made to admit his crime, and on December 19 he and his clerk, after long immunity, were fined \$100 each. In St. Louis I found the Lottery's agents active but sly. The office of the chief agent was a pretended cigar-store, a mere hole, six by fourteen, with a screen in front. Near by the whole interior of a vast block was given up to a labyrinth of pool-rooms, packed with motley crowds of men, youths, and negroes. All kinds of pools were being sold on horse-races in the East and South, and on base-ball games. There were counters where half-dollars could be staked, and to these youths who looked like clerks and mechanics were thronging in the noonday hour. Shortly after my visit, the Supreme Court of that State sustained the Missouri law against pool-selling, and that hive of industry has since been closed.

Though the people of this country have been strangely blind to the fact, the "Louisiana State Lottery" has been a national question for twenty years; the moral view aside, it remains a business and a political issue. A National Committeeman is authority for the statement that in the campaigns of 1884 and 1888, the Lottery made large and equal contributions to the fund of each party. What would it not give for a deaf, dumb, and blind Postmaster-General in Washington and a friendly postmaster in New Orleans, no matter of which party!

The Lottery is the farthest reaching of all the pestilent gambling enterprises of the Union. Saloons, barber-shops, and cigar-stands are the centers of its traffic. Even if the Lottery is stripped of the power of the State that it degrades, this kind of crime will of course be carried on by somebody in secret though on a smaller scale. But if the Lottery fastens itself anew on Louisiana, owning her, as it will, both body and soul, and if it secures control of Congress and the United States mail, as it is trying to do by its political contributions, then let the country be equally kind to her allies the gambling-houses and pool-rooms; establish them by constitutional amendments; let each State have its own lottery; and induce John A. Morris to extend his benevolence by teaching his own New York, as he has taught the Pelican State, how to feed her children off her own flesh, while she fattens him.

C. C. Buel.

TOPICS OF THE TIME.

Will an American State be Guilty of Suicide?

IN this number of *THE CENTURY* we present some of the results of a recent personal investigation made by one of the editors of the magazine into a subject of pressing national importance—namely, the Louisiana Lottery. We think that no fair-minded reader can go through this paper carefully without being amazed at the gradual revelation there made of unworthy and demoralizing habits and passions, fostered in the coldest blood by designing and greedy men, through all the various expedients of temptation, corruption, chicanery, and intimidation. Never was the livery of heavenly charity more flagrantly stolen “to serve the devil in” than by the beneficiaries of this far worse than mere gambling institution.

If the lottery should succeed, it is no mere figure of speech to say that the life of one of the fairest States of the Union would be crushed out of it for at least one generation, and those who mistakenly, weakly, or corruptly assist in the deed, and their children after them, will suffer dishonor and injury to an extent they now seem little to realize. But it is not merely a State question, or a national question having to do with one of the States of the Union: the Louisiana Lottery is a curse from one end of the country to the other. Its ramifications and evil designs are only half understood by the people at large. Unless it is crushed out it will ally itself with every sinister influence in the nation, and breed evil, and that continually, to the end of its pestilent days.

A “Cheap-Money” Hand-Book.

THE articles upon cheap-money experiments and delusions which have appeared in this department of *THE CENTURY* during the past year have been collected into a neat pamphlet of twelve chapters, which The Century Company has published at ten cents a copy, or five dollars a hundred. This publication has been fairly compelled by the wide-spread interest which the articles have aroused, and by the requests which have come to us for them in a convenient and cheap form, suitable for popular distribution.

As a sample of the interest awakened, evidences of which have reached us in almost innumerable letters and newspaper clippings, we cite the following voluntary and gratifying testimony from the editor of an important newspaper in Kansas:

We are finding *THE CENTURY* a most valuable aid in fighting the financial heresies that have taken possession of Kansas during the past year. Your articles on finance have furnished the backbone of thousands of campaign speeches and newspaper articles in our much-maligned State. Give us more of them and we will soon be restored to health and sense.

It was for the purpose of supplying material for such use as this Kansas editor says was made of the articles that we published the series. It seemed to us that the most effective way in which to meet and refute unsound financial theories of the present time was to show that they had been tried and found wanting in other times;

to show that, instead of being new, they were as old as economic science itself, and that, instead of being experimental, they had an unbroken record of human experience against their success in practice, extending over a period of nearly three hundred years. We began the demonstration with the history of the English Land Bank scheme of 1696, and ended it with the story of the Argentine Republic's experience with similar theories in our own day. In the twelve chapters of the pamphlet will be found the history of the more important of the cheap-money experiments of past and present times, including those of several of our State banks in the early part of the present century.

The material thus brought together is to be found in no other single publication. It has been obtained from many sources, some of them very difficult of access, and all of them entirely trustworthy and impartially accurate. The pamphlet is, therefore, a compact hand-book of exact information upon a branch of financial and economic history which is especially interesting and instructive for the American people. It will show them that all the schemes that are advanced in these later days for making money more plentiful and increasing everybody's prosperity have been tried in times past, and have, without exception, failed in practice, leaving behind them nothing but disaster and disgrace.

We are rejoiced to be able to say that since we began the publication of this series, a year ago, the danger that the United States might be misled into repeating as a nation some form or other of these financial blunders has been greatly lessened. The Farmers' Alliance, with its mischievous subtreasury scheme, the details of which are set forth in chapter VII of the pamphlet, was at that time in the height of its power. It had carried the State of Kansas in the preceding November election, and was making serious inroads upon the strength of the two great political parties in various Southern and Western States. The “silver craze” was also at its height, and had such powerful support in Congress that the country seemed destined at an early day to make a descent to the silver standard of value. To-day the outlook is much less ominous. The Farmers' Alliance was defeated as signally in the recent November election in Kansas as it had been successful in the election of a year earlier. In the Southern States, notably in Mississippi, the fallacies of the subtreasury scheme were taken up for public discussion by leading Democrats, and were argued with such fearlessness and ability as literally to be driven from the minds of the people. Even among the Alliance members themselves discussion of the subtreasury scheme has brought it so much into disfavor that a majority is to-day against it, and it is passing rapidly into the oblivion set apart for financial heresies. The silver craze has so far spent its force that there is now little danger of free-silver-coinage legislation by the present Congress, and if that should adjourn without action there is every reason to believe that the danger will have passed, never to return.

If *THE CENTURY* has contributed, as our Kansas

correspondent says it has in his State, to produce this healthier tone in public sentiment throughout the country, this sounder, because more intelligent, view of financial principles and economic laws, it has accomplished the purpose it had in view in publishing the series. The result is gratifying in many ways, but chiefly so in confirming the belief, profound and abiding, which we have always maintained in the intelligence and honesty of the American people. The history of all the financial delusions which have possessed this country from time to time shows that the duration of each of them has been short—that it has in fact kept its hold upon popular opinion only so long as was necessary for the people to inform themselves as to its real character. The duration of this hold would have been much shorter in every instance if the professed leaders of the people, the men whose duty it was to guide them aright in all such matters, had been worthy always of the positions they occupied. If, when a “craze” breaks out, such leaders, instead of yielding to it, for fear opposition might cost them votes and place, were to explain to the people its real nature and its powerlessness to bring to them any of its promised blessings, it would make very little headway. The leaders have opportunities which the masses of the people do not have for informing themselves upon these questions, and if they were true leaders instead of false, they would impart their information when it was most needed. No one who has studied the history of popular “crazes” can fail to be struck with the fact that all of them have received their death-blow from a few courageous men or journals that have had sufficient faith in the American people to tell them the truth without fear or favor.

The Metropolitan Museum.

NOTHING could bring to mind more forcibly the rapid growth of artistic expression, and of the interests of art generally, in this city within a short time, than to turn, as we did the other day, to what we said on the subject in these columns not quite eight years ago (April, 1884), and contrast our remarks with the present condition of affairs. We have not reached the millennium yet,—nor, to be sure, is there any immediate danger of its approach,—but how much there is in that article which we could not say to-day, even were we so inclined!

We said, while urging the importance of an architectural department in the museum, that in this city “more bad architecture has been perpetrated in the last thirty years than perhaps ever was accomplished elsewhere”; but hardly were the words out of our mouth when matters began to improve. The down-town buildings began to express the dignity and solidity of our wealth, where before they had illustrated only its less attractive characteristics; corporations straightway took unto themselves souls, and demanded that their structures should be more artistic, as well as bigger, than those of their neighbors; the Washington Arch, undreamed of then, is a well-nigh accomplished fact; and now the joyous beauty of the Madison Square Garden has come to teach that even the every-day places of amusement are not unworthy of the highest efforts of the architect.

We believe we mentioned “blue china, and Capodi-Monte and Limoges enamel” as the only kinds

of acquisitions to be expected from American millionaires, fearing that great masterpieces were hardly to be looked for from their generosity. Since that time one of these same millionaires has given the Metropolitan Museum a collection of old masters which any museum in Europe would be glad to possess, a gift of which a prince justly might be proud. Others have followed his example in giving or lending splendid pictures for the benefit of the public,—though the number of such benefactors is by no means as large as it might be,—and while it is still true, as we then said, that there is not in this country, to our knowledge, any really great Italian painting, the northern masters are worthily represented in quality, if not in numbers, in both public and private collections. The Sunday-afternoon opening, which, like many another good and Christian work, was accomplished only with toil and sorrow, has proved to hard-working people of all classes the greatest blessing which the trustees had it in their power to confer.

It was the Metropolitan Museum, its methods and its management, which formed the burden of our lament in the article we have in mind. More than once we have had occasion to say a serious word upon this topic, a duty which we felt the more imperative because of our interest in the institution itself, and our ambition to see it occupy the position it should in a community like that of the New York of to-day. For the same reason we hail with pleasure so much the keener every movement in the right direction, every endeavor to make its usefulness broader and more substantial; and our pleasure is no less genuine because the advances and reforms at the museum have been most conspicuous in the line of the program suggested in the editorial first referred to. In the light of recent events, we look back with peculiar satisfaction to what we said upon the subject of casts. It will be remembered that at the time we wrote the museum possessed no casts or plastic reproductions of whatever kind. The only conception of Greek sculpture which the visitor could acquire was that offered by the Cyprian statues; and even their most enthusiastic friends must admit that these suggest little of the glories of Pheidias and Praxiteles. They are hardly the examples which our sculptors would select for inspiration, and it amounted to a libel upon Greek art that these should be its chief representatives in a museum intended to be educational. It was with this fact in mind that we said: “It would seem natural that the first attention of a great American museum should be directed to such things as these; that one of the first acquisitions should be a collection of casts of all the great Greek sculptures. Sculpture has the immense advantage that it can be more adequately represented than any other art,” and so on. We will not quote our own wisdom, but notice what has happened since those words were written. In a most overwhelming manner have those been discredited who once despised the plaster cast as unworthy a place in an institution of the first rank. First, the president of the museum, with characteristic liberality, realizing the necessity of including reproductions in the museum collections, gave \$10,000 with which to form a nucleus. Then we began to reap the benefit of Mr. Willard’s magnificent bequest of \$75,000 for the purchase of architectural casts and models—a sum probably much larger than has ever been devoted to this purpose by any museum in Europe, with the ex-

ception of what the French government has done for the Trocadéro. Last, and best of all, comes this new committee of gentlemen, interested both in the subject and in the museum, who have already raised some \$100,000, a large part of which they have contributed themselves, for the purpose of presenting to the museum, on the part of the public, a collection which, supplementing those already mentioned, and devoted mainly to sculpture, will produce a museum of reproductions without a peer in the world. Is there not cause for rejoicing?

The composition of the committee shows that the desire for such a collection is not confined to any one class or profession; and the manner in which the project has been started is the best guarantee that it will be carried out satisfactorily. First of all, amateur knowledge has been discarded. From the beginning the committee have placed themselves under the guidance of experts. They began by inviting experts in this country to prepare for them lists of objects which it would be desirable to have in a collection intended to be illustrative of plastic art in all epochs. These lists, which were drawn up by Mr. Edward Robinson of the Boston Museum of Fine Arts, and Professors Allan Marquand and A. L. Frothingham of Princeton, were published in a sumptuous style as "Tentative Lists," for the purpose of inviting further suggestions. Copies were sent to the principal European authorities on the history of art, as well as to those of this country. As a result of the replies received, and of Mr. Robinson's visit to Europe in the interests of the committee, the final lists of the collection have been prepared, the or-

ders have been sent out, and we presume that there is hardly an important foundry of plaster casts in Europe which is not occupied with work of which our city is to enjoy the benefit. The prospect of so much that is good and valuable makes us impatient for the time when the ultimate hopes of the committee shall be realized, and all the casts of the Metropolitan collections be brought together in a separate building erected especially for them—a building in which all questions of effective arrangement and proper lighting can be settled without restrictions of space or regard to the needs of other departments. The present structure, even with the addition now being completed, will of course be far too small for all that is to be comprised in these collections, and if the intentions of the committee are fully carried out, we shall be able to boast of a museum which is absolutely unique—a place where students may find all the necessary materials for inspiration and instruction, where painters, sculptors, and architects may enjoy, not indeed a substitute for study in Europe, but a most delightful and useful reminder of treasures seen there, and where everybody may feel the quickening influence of great thoughts expressed in beauty of form and line.

There are other reforms and improvements still possible at the museum, which would bring the institution into still higher esteem throughout the world of art; but as this is a subject on which our views are well known, and as we desire to say only complimentary things at the present moment, we will not be specific on these points. Just now we heartily wish success to the liberal plans of the committee on casts.

OPEN LETTERS.

The Regular Army and the National Defense.

HOW to prepare the republic for war is a topic that has been quite frequently discussed of late in the public journals. The articles upon this subject have been unanimous only in one respect—they have all maintained that preparation is necessary. Each writer has his own theory as to how the preparation should be accomplished, and any one of them would be feasible with a central government that could enforce the measure. None, however, seem practicable under a republican government such as the United States, because our institutions are incompatible with the requirements of military service. We must have a military system adapted to our form of government, and any attempt to assimilate it to the methods of the European powers must fail for the want of an arbitrary power to enforce it. Our statutes have borne upon their pages for nearly a century some military laws that are fundamentally the same as those of the German empire to-day, but for half a century they have been a dead letter. They constitute every able-bodied man between the ages of eighteen and forty-five a soldier, and require of him certain services. These services are never rendered, and the laws are complied with in but few trifling particulars, and in their tendency to the national defense they amount to nothing.

The regular army of the United States is content

with trying in a feeble manner to imitate European methods in such details as the authorities are able to enforce. These imitations are limited mainly to matters of dress, drill, and exercises, and are usually patterned after that military power that was considered to be in the ascendant. So long as the French were victorious we wore the French uniform and taught French tactics, and when the Germans conquered the French we donned the helmet, and now gather our ideas of progress from the German ranks, regardless of the difference of environment. The conditions of our service are so very different that we are not justified in this humiliating imitation and importation of foreign military methods. We should have a purely American and republican army, adapted to our surroundings and our form of government. There are no conditions on this continent that call for anything approximating to the standing armies of Europe. Such preparation here would be a waste of energy and time.

On the continent of Europe the situation requires that the armies should be ever ready for immediate action, and no first- or second-class power can afford to neglect this precaution. No such condition exists on this side of the water. When we consider these facts, it is difficult to understand why we should imitate and adopt so many of the details of their vast preparation. Much of the duty these large armies are engaged in has been instituted to furnish occupation for the troops dur-

ing times of peace; otherwise they would much more frequently become an element of danger to their own government. Take the matter of drill. Very much the largest part of drill tactics has no practical application in actual warfare. There was a time when it did. When battles were won by the shock of compact bodies of men from three to six ranks deep, drill was an important factor in maintaining compact formations. Now, to conduct a compact formation, even at the regulation route-step, within range of the improved long-range arms would be fatal. Compact formations are justifiable only beyond range for the comfort of the men and to economize space. Then why should we on this side waste so much time on the minutiae of complicated drill tactics, repeating, from one year to another, what a soldier is able to acquire in a few weeks as well as he ever can, when, as will be shown hereafter, he might be so much better employed? All we need or use of drill in actual war is to pass from column into line and from line into column by the simplest possible methods.

The use of drill tactics constituted an insignificant factor in the war of the Rebellion. That a large proportion of the exercise of it can be dispensed with even in the European armies is evident from the fact that the German volunteer, when his means will enable him to do it at his own expense, can get through with the military duty the Government requires of him in one year, while the impecunious conscript must take three years, when it is possible that the latter may be endowed with natural abilities to do the same duty better and in half the time. Different conditions justify different tactics. The Indian has no use for Upton, and all the information we could acquire from that manual would be of little service in qualifying us to meet the wily savage in the use of his own tactics. Our great difficulty in fighting the Indian is to adapt our service to his tactics. Every nation endeavors to put its military establishment on a footing that will make it superior to the dangers which threaten it.

While we need not be wasting our strength and resources in preparation for immediate war, we cannot afford to ignore the necessity that exists that we should be organized and properly instructed for war, as the surest method of preventing it. It is in war above all other maladies that an ounce of prevention is worth a pound of cure. We should have a sufficient military system to enable us to keep pace with other countries in the knowledge of the art of war, and to be able to utilize our resources in the event of the misfortune of war coming upon us. This is the general character of the preparation to which the intelligence of the nation must be directed.

The first requirement for national defense is an army properly officered; that is, fully supplied with officers thoroughly informed in their duties and capable of instructing the rank and file in their duties. Our present army can be utilized to that end by making every military post a military school, for which the graduates of the academy would be the proper instructors, and could educate the enlisted man to that degree which would qualify him to serve as an officer in the event of a war. To this end, the age for enlistment should not be over twenty-one years, and reenlistments should be exceptional. The matter of reenlistment has grown into a serious detriment to the service. The rank and file

should be young men always, and for the subalterns youth is the first qualification also. War is the young man's opportunity to realize his dreams of greatness and the admiration of mankind. He has less to lose and more to gain than the man of maturer years, who has entered upon the career he has chosen, and assumed responsibilities that he cannot lightly forgo.

If, in addition to the condition of youth, the recruits be selected *pro rata* from all portions of the Union, we provide for the dissemination of military knowledge throughout the country where it will be needed when the nation calls upon its sons to defend it in the hour of danger.

By constituting the regular army an educational institution for the purpose of furnishing instructors for the available militia of the land in time of need, there would be little if any addition necessary to the annual appropriation to carry the measure into effect. The low social status of the enlisted man would be at once raised to a plane of the highest respectability. The character of the duties would be such as to exclude from the ranks that element which furnishes the deserters, the gamblers, and the drunkards of the service, who have thrown so much discredit upon the army in times of peace as to deter the respectable youth of the country from entering its ranks.

By making the army respectable and introducing as the fundamental principle of the service the education of the young soldier, and his preparation for a higher station in life, at the public expense, there would be no difficulty in keeping the army filled with the best and most energetic of the youth of the land. We have had ample proof in the history of the country, and the existence of the military organizations in every State and Territory, and the devotion with which the people worship their military heroes, to make it certain that there would be no difficulty in keeping our little army full of the right kind of material for the defense of the nation in case of danger. But the army must be made distinctively republican, and adapted to our form of government.

Our army is limited to 25,000 men. If the recruits were selected from the different sections of the Union *pro rata*, fifteen from each congressional district annually would keep the army full, and at the end of five years they would return in the same proportion to the districts which sent them, and after the system was fully established, it would supply, every five years, seventy-five young men graduates from the army, instructed in all the duties necessary, from which the officers could be selected to supply the quota that would be called into service from the district in the event of a war. This number would be ample, the supply would be continuous to replace casualties, and the knowledge which they would bring would be up to date as regards progress in military methods.

With such a source from which to draw instructors, the raw levies called for could be in a condition for defense in the shortest possible time, and if the war clouds were as slow in gathering as they would be in the event that our enemy came across the ocean, they might be sufficiently prepared to act on the offensive by the time the storm burst upon the country. It is self-evident that there is no method provided by which the forces of the Union can be utilized and made effective to meet an emergency; the nation would be subjected to

humiliation and disaster before her strength could be organized for defense, and it would be impossible to estimate the loss that must be endured before the military strength of the country could be in a condition to act on the offensive.

To carry these views into effect, nothing more is required than a resolution of Congress to the effect that the army in time of peace shall be conducted as an educational establishment, for the purpose of preparing officers and instructors in military duties, and to disseminate a military knowledge throughout the entire Union, so that every section may have means of defense in any emergency. The enlistment laws should be amended so that the recruits would be obtained from the various sections in proportion to the population, and only young men under twenty-one years of age should be enlisted. Reënlistment should be authorized only in special cases where men had shown themselves exceptionally qualified as instructors, and should be an honorary privilege attended with increased pay and distinction, to serve as a stimulant to all.

Should this system be adopted, it would take five years with the present period of enlistment before the supply of material for officers would begin, but at the end of ten years every section of the Union would be supplied with a sufficient number of army graduates to officer and prepare for the field any number of volunteers that would be likely to be called for or required in any emergency.

Should war fail to come,—and the fact that we had such a means of preparing for it would be a very effective method of warding it off,—the young men from the army would still be a valuable element of the communities to which they would return. Besides being good patriotic citizens, they would be valuable as instructors for the National Guard organizations, and would keep alive in the country the military spirit so essential to our existence as a nation.

The measures herein suggested are so simple and easy of execution, and so important in their object, with little if any additional cost to the Government, that their adoption should follow in view of the fact that there is so little preparation for the national defense. The plan is both democratic and republican, for it would make our army a representative institution, drawn from the people, for the people, and would be as beneficial during peace as in war, and would give a strength to the republic it has never had. The social and political status of the army would rise to be the pride of the nation, and as long as our enemies are as remote as at present, no other means for marshaling the troops would be required for the national defense.

August V. Kautz,
Brevet Maj.-Gen., U. S. Army.

A National Militia.

"Solon said to Cæsus, 'If another come whose iron is better than yours, he will take away all this gold.'"

THE United States is to-day the Cæsus of nations, but there are in Europe at least six great powers whose iron of war is better than our gold. Any one of these, by merely arranging a convention to secure the neutrality of the others, could extract indemnities from us, limited only by its cupidity and our wealth.

For some years there has been more or less friction in our relations with the German empire. Our relations with Canada and hence with England have been for some time decidedly strained. The same causes which brought about the Mexican war, in 1846, exist to-day, but in vastly increased ratio, viz.: the presence of a numerous colony of our people on Mexican territory and the investment of many millions of our capital in Mexican enterprises. China has repeatedly entertained against us a *casus belli* more strong and just than any which has led to the numerous wars of this century. Should the Panama canal ever be completed, we can look forward to it as a fruitful source of diplomatic discussion, if not of serious international contention. Some of our leading statesmen have asserted on the floor of the Senate that the mere existence of that canal as a European property, under foreign control, would constitute an infraction of the Monroe doctrine, which is at present our sole foreign policy, and which we cannot now abandon without losing national prestige and incurring national disgrace.

All history shows that the suggestions of a nation are respected and heeded only in proportion to the amount of organized, equipped force with which she is ready to emphasize them. If we expect our just and reasonable demands to be respected and heeded by the powers, we must have a navy and we must organize and train a national militia. We are to-day building ships, but we are without soldiers, and these cannot be made of the standard pattern in a day, or a week, or a month. But war may come upon us with giant strides. With the vast accumulations of wealth in our defenseless lake and sea-bound cities, we offer to any well-armed, first-class power the safest, richest picking which the earth has furnished since Pizarro sacked Peru.

Thé Constitution fully recognizes the vital importance of the subject, and invests Congress with ample powers to enact the necessary laws. In 1792 Congress passed a Militia Act which is to-day the militia law of the United States. Under its provisions must be drilled and trained, if they are to be trained according to law, the seven millions of able-bodied citizens between the ages of eighteen and forty-five who are to form the reserve to our little regular army.

Through the neglect of Congress, the whole nation is left without a practicable militia law. Hence the individual States are left to their own devices in providing a reënforcement to their various municipal police forces. This police reserve is a measure of necessity merely as an additional insurance on life and property where a dense population exists in proximity to vast accumulations of wealth.

For all the purposes for which it was intended, it would be difficult, without a vast increase of expenditure, to devise a more reliable or perfect organization than the New York State Guard. But when we come to look at these organizations from a national standpoint, they present a very different appearance. In fact, they do not exist at all so far as the United States is concerned. Let us suppose, by way of illustration, that Congress, acting within its constitutional powers, declares war and calls out the militia, and that the President then makes requisition on the governor, say of New York, for a certain number of militiamen. Of course the only militia which he has a right to call

for are the national militia, those existing by reason of and in accordance with the Constitution and the Act of 1792. The governor might truthfully reply that there was not a single national militiaman in his State, that the men at his disposal were the State Guard, organized and maintained by acts of its legislature, and that, as they were not the product of any national legislation, he did not recognize the right of the President of the United States to make requisition for them. This would be a very temperate and civil response for a governor to make compared with some recorded in our history. The President's only recourse then would be to issue calls for volunteers. He might get them and he might not, depending on whether or not his war was popular in that State. Thus it is evident that even the small number of militia in our country who are drilled and disciplined are entirely beyond the control of the President in time of war. Of course the individuals composing the State armies are at liberty to assist the President in his war, provided the governors do not interfere to prevent them. But there have been several instances where governors have so interfered. In short, the citizens accept or decline the invitation to attend the war, as best pleases them. When everything in the nation is staked on the chances of battle, the President of sixty millions of people should not be an issuer of invitations, but of orders.

Of late years there has been a growing and manifest desire on the part of the Government to disseminate military instruction among the people. This important question resolves itself into two parts: first, how shall the requisite number of men be disciplined and drilled; second, how shall the Government be guaranteed that in time of need it can command the services of the identical men upon whom it has spent its time and money. The Government would not be justified in arming and drilling men and yet leaving the matter in such shape that, when it called for soldiers, the State governors could give it either raw recruits or none at all, at their pleasure, which would be the state of affairs should it spend money on the so-called National Guards as they now stand. In short, the Government, in proposing to arm and train A. and B. to be soldiers, should have the power of insuring itself that when it asks for soldiers in an emergency, it shall get A. and B., whom it has trained, and not C. and D., who are ignorant of a soldier's business.

To attain this end, there is no more simple and practical method than to pursue our great national precedent of a subsidy; but always having it clearly understood and fully admitted by all concerned that the Government reserves the right to command, at any time, the services of the identical men whom it has trained. Next, let us establish a standard militiaman, and fix the price to be paid for him. On looking the world over, we will find that there is no commodity in its markets whose price varies so much as that of the soldier. A soldier costs Germany, per year, \$202; France, \$208; England, \$405; the United States, \$990. These figures represent the cost of regular soldiers, whose entire time is devoted to armies. In our own country, New York, which has the largest and perhaps the best State Guard, pays annually, per man, about \$35.00. All things considered, the United States Government could well afford to pay annually, per man, \$50.00 for standard United States militiamen. In this way Congress could

fix the number of men for whose military instruction it saw fit to provide by inserting a corresponding sum in the yearly appropriation bill. It could train twenty thousand men for one million dollars, forty thousand for two millions, and so on, according to the varying needs of the country.

The dual allegiance which every citizen owes the general and State governments should be recognized. The militia would be entirely under the control of the State for local purposes, except at such times as Congress might call them forth for the national defense. The States would furnish the men and the nation would pay the cost. The general Government, being the major power, should claim the right of precedence in commanding their services. A more just and equal copartnership cannot be devised. It is constitutional, rational, and practicable, and were it adopted by the States generally, it would have the effect of rendering the State National Guards constitutional and legal, which at present they are not.

Robt. Kennon Evans,

FORT LEAVENWORTH, KANSAS.

Lieut., U. S. A.

George De Forest Brush.

THE "Moose Hunt," by George De Forest Brush, engraved in this number of *THE CENTURY*, is probably his strongest picture; and one can hardly regard it without high admiration for the mental and technical equipment of the painter. It is like opening a window and looking out into another age, upon another race, almost into another world. To achieve this result a high resolve and an unflinching steadfastness of purpose are needful, and these qualities, combined with great technical skill, have been observable in Mr. Brush's work since 1880, when, at the exhibition of the Society of American Artists, he made his first appearance before the American public with a picture inspired by Bret Harte's "Miggles." Up to that time Mr. Brush had pursued the uneventful career of an art student, first at the Academy of Design in this city, from 1871 to 1873, and after that, from 1874 to 1880, in the studio of Gérôme in Paris. Returning to this country in the latter year, Mr. Brush, with the courage of his conviction that as an American he must paint subjects suggested by American life, has passed much time in the West and in Canada gathering the material for a large number of pictures of Indian subjects which have greatly increased his reputation.¹ In 1890, at the age of thirty-five (having been born in Shelbyville, Tennessee, in 1855), Mr. Brush returned to Paris, where he still remains. Rumors of a change in his opinions, a realization that art, to be American, need not necessarily be local, have reached his friends here, and may be true or not, though the classical subject which he is reported to be painting would bear out such a supposition. But whether his views remain fixed or change with the seasons, Mr. Brush will always be an important factor in our art, where we have too few men who think, and, thinking, execute with sureness born of knowledge.

¹ For Mr. Brush's individual views on his art, see *THE CENTURY* for May, 1885. Mr. Brush was elected member of the Society of American Artists in 1882. In 1888 he received the first Hallgarten prize at the National Academy Exhibition, and was elected an associate of that body the same year. He has also had charge of classes at the Art Students' League and the Women's Art School, Cooper Union.

IN LIGHTER VEIN.

IN AN ART-GALLERY.

A Valentine Villanelle to Kate.

ON this St. Valentine his day
The feathered songster woos his mate,
And each true lover chants his lay.

The lilting birds trill clear and gay,
And strive with song to pierce heaven's gate,
On this St. Valentine his day.

The swelling buds show green to-day,
For tardy spring they scarce can wait,
And each true lover chants his lay.

The coyest maid yields to love's sway
(As troubadours' old tales relate)
On this St. Valentine his day.

How easy "Yes" it were to say!
Let those sweet eyes consent to fate
While thy true lover chants his lay.

A word of cruel scorn like "Nay"
Should fall not from the lips of Kate
On this St. Valentine his day,
When each true lover chants his lay.

Mary C. Hungerford.

Yo te Amo.

"Yo te amo!" Would you know
What these words mean, you must go
Where eyes speak and lips are still.
There where sings the mountain-rill
"Yo te amo," in its flow
To the rushes bending low,
And the blushing cloudlets sigh
"Yo te amo" to the sky.

"Yo te amo!" 'T is a breath
Soft, but lingering till death—
Murmured by the moonlight fair,
O'er the perfumed grasses there.
E'en the flowers at your feet
Kiss them as they breathe it sweet,
And faint echo calls it low—
"Ah! I love thee, love thee so!"

Rosalie M. Jonas.

A Contrast.

CERTAIN it is, in ancient times,
That poetry was free from rhymes.
To-day, alas! most rhymes are free
From anything like poetry.

Frank Dempster Sherman.

Consistency.

REPROACH me not, though it appear,
While I true doctrines teach,
I wholly fail in my career
To practise as I preach.

Yon guide-post has, through countless days,
"To London" pointed on,
Nor once has quit the angled ways,
And up to London gone.

Doane Robinson.

Something Forgotten.

I MET her first on yesternight,
And rashly promised to indite —
For one so charming in her prime —
A tribute of most humble rime.
'T is almost finished, quite complete
In meter, cadence, verse, and feet;
But I forget, alas! alack!
If those dear eyes were blue or black,
While it would cost me several guesses
To hit the color of her tresses.
Ah, memory, treacherous and false,
Was it a polka or a waltz
In which the pleasing task was mine
To guide her breathing form divine?
And whether she was short or tall
Is something which I can't recall.

J. A. Macon.

Who lies as well as Truth?

WHY do men doubt me, since the truth I tell,
While Ananias prates to credulous ears?
Is it because his lie is plausible,
While my plain truth less credible appears?
Thus Hell itself from modern creeds is driven,
While all theologies unite on Heaven.

S. R. Elliott.

A Little Tory.

WHEN knickerbockers were the style,
She dwelt upon Manhattan Isle,
Where now a massive granite pile
Frowns grim and gloomy.
Her laugh was like the trill of bird;
A brook-note seemed her every word;
And it may rightly be inferred
Her cheeks were bloomy.

To storm those hostile to the king
Keen verbal missiles would she fling;
She deemed a patriot a "thing"
Without discretion.
The throngs of troopers clad in red
So turned the lovely maiden's head,
She *worshiped* Britons all, she said,
And *liked* a Hessian.

Her merry bosom thrilled with pride,
One evening at her mother's side,
When bowed before her, ardent-eyed,
A gay young captain:
And through the mazy minuet
She played the shy, demure coquette,
Till hopelessly her Cupid-net
She had him trapped in.

Alas! his lover-reign was brief;
He fell from grace as falls the leaf
When crisp October days bring grief,
And hills grow hoary;
For one appeared, of courtly suit,
With dashing air and spur on boot,
In war and love no raw recruit —
So runs the story.

And rumor said — that fickle dame
Who breasts the brunt of righteous blame —
That from the camp afar he came
On secret mission.
He told the maid of fields of fight;
She listened with a keen delight,
Until she dreamed a warrior knight
No vague tradition.

He wooed and won. The wedding-day
Was set, when he, before so gay,
Grew grave and gloomy as a gray
And sunless morning.
To all the mournful change was clear;
He paled at sudden sounds; his ear
In soft breeze-whispers seemed to hear
Some word of warning.

At last, one evening, as he pressed
The maiden to his martial breast,
His troublous secret he confessed,
By conscience smitten;
Declared he could no longer meet
The woman to his heart most sweet
With lying words and base deceit —
He was no Briton!

But love still beacons from her eyes,
Though she was silent with surprise;
And as he, free from all disguise,
Now bent above her,
He told her of the dangers rife,
And hinted at the laws of strife —
How, captured, he might lose his life,
And she her lover.

And since her tender heart was true,
What could this *loyal* maiden do,
When it was "all for love," she knew,
That he had tarried,
But join him in his hurried flight,
And cross the slumbering lines at night?
Kind Fortune led the lucky wight;
No plan miscarried.

When every danger had been passed,
And they had reached the camp at last,
The soldiers' arms aside were cast
To greet their idol.
Then, ere another day was done,
The chaplain came and made them one —
'T is said that General Washington
Danced at the bridal.

That is her picture hanging there
Behind the antique rocking-chair;
The painter e'en of all that 's fair
Could not divest her.
Would happy fate had made it mine
To see your eyes demurely shine,
And listen to your voice divine,
My sweet ancestor!

No. 5.

ST. PAUL'S.

It was hard to decide with what church an account of English cathedral-building should begin, but there can be no question as regards the one that must close the story. After the Norman or Romanesque period came the Gothic with its three successive styles — Lancet-pointed, Decorated, and Perpendicular. After these came the Renaissance period, which produced not a group or series of cathedrals, but, in magnificent isolation, the one great church of St. Paul's in London. And this is the end: St. Paul's is not the last large church that has been built in Great Britain, but it is the last which reveals an architect of genius, or illustrates a genuine phase of architectural development. It is rarely called the Cathedral of London. Many churches have been named for St. Paul, as for St. Peter and Our Lady. Yet every one knows that "St. Paul's" is in London, as "St. Peter's" is in Rome and "Notre Dame" in Paris.

I.

THE name of London possibly comes from the Celtic *Llyn-din* (meaning a lake fort), which, after the Roman conquest, was transformed into *Londinium*. At all events, a city stood in British times upon the spot, sixty miles from the sea, where the River Lea joined the River Thames, and the confluence of a third stream, the Wallbrook, supplied a harbor for the tiny vessels then in use. The legends which say that a temple of Diana first occupied the site

now covered by St. Paul's, that a British-Roman Christian church was built there, that King Lucius was converted, and that St. Helena was in some way concerned in the evangelizing of the place, are as unverifiable as the one which claims that Restitutius, a British bishop who was present at the Council of Arles in 314, took his seat as bishop of London. In short, little is known of British or of Roman London except the fact that they existed; and after the Saxon conquest the municipal record is still almost a blank for centuries, until King Alfred, when he had expelled the Danes in 886, rebuilt and fortified the town which lay a waste of ruins beneath his feet.

The ecclesiastical history of London begins further back than the municipal, although in disjointed fragments. In the year 604 St. Augustine consecrated Mellitus as Bishop of London; but after the death of Sæbeht, the Christian king of the East-Saxons, his flock relapsed into paganism and he was driven home to Kent. In 675 Erkenwald was placed in the reëstablished chair; and so great were his services to the town as well as to the church that he was sainted after death, and was held in particular reverence by the people of London till the Reformation swept such memories away. Then came a line of bishops who, with the exception of the great Dunstan, are now little more than names; and then, in 1044, Edward the Confessor, in accordance with his foreign leanings, appointed a Norman named William. "By reason of his goodness," say the chronicles, William was left in peace when, in the anti-Norman reaction of Edward's later

years, other alien bishops were turned out by the people; and after the Conquest he repaid the debt by persuading his namesake the Conqueror to confirm the city's ancient privileges. Therefore he too dwelt long in the affections of the London folk: until Queen Elizabeth's time at least they made an annual pilgrimage of gratitude to his tomb in the nave of St. Paul's.

But the St. Paul's where he had been buried, the first St. Paul's which we are sure existed, had perished very long before this, destroyed by fire in 1087, only a year after his own death. Bede declares that Mellitus founded it, and Erkenwald is said to have "bestowed great cost on the fabric thereof"; but it was probably a wooden church, often burned and repaired, and greatly changed between Erkenwald's time and that much later time when Ethelred the Unready was buried and his successor Edmund and the Danish Canute were crowned beneath its roof. The Confessor's preference for his great new abbey-church at Westminster threw its older claims into shadow. There, on ground which was not yet London ground at all, instead of in the cathedral church, Edward was buried and Harold and William received their crowns, and near by William Rufus built himself a palace. The practice then begun was resumed after London became the royal residence. No king since Ethelred has been buried in St. Paul's, none since Canute has been crowned there, and John of Gaunt's was the only princely sepulcher which adorned the cathedral that replaced the first one and existed until the great fire of 1666.¹

II.

THIS second church is the one that is commonly called "Old St. Paul's." It was begun in 1087, the last year of the Conqueror's life, by Maurice, the first bishop of his appointing, and was built, of course, after the Norman fashion. Its construction proceeded slowly, and, in the year 1139, was delayed by a ruinous fire. Later in this century William of Malmesbury spoke of it as a "most magnificent" edifice, but it had grown and altered much before it was described and pictured with greater definiteness. In 1221 the choir, which had been very short with a semicircular end, was replaced by a longer one in the Lancet-pointed style; and in 1225 a Lady-chapel, equal to the

choir in breadth and height, was added. Toward the end of the thirteenth century Old St. Paul's stood at last complete, and it was then the largest as well as the most famous church in England. Its length is estimated to have been 590 feet, and its width 104 feet; the spread of its transept was 290 feet; and its height was 93 feet in the nave, and 101 feet in the choir.² Wren calculated that the height of the spire had been 460 feet, and this means that its gilt ball and cross rested on a point fifty feet above the point of Salisbury's steeple; yet an even loftier altitude had been claimed for it by earlier historians. The nave and choir were of equal length, each consisting of twelve compartments or bays; and each transept-arm had two aisles and was five bays in length. The east end was flat, after the general English fashion; but French influence seems indicated by the great rose-window and the group of lights of equal size that stood beneath it, as well as by the unwonted altitude of the choir. The central tower was open as a lantern, perhaps even to the base of the spire. The southwestern tower was the famous "Lollards' Tower" or Episcopal prison, and, like its mate, was low and plain, while the front between them was poor and bald even for an English church. Doorways of exceptional size, however, opened into each transept-end, and there were other great doors into the north and south aisles of the nave.

Although kings and princes slept elsewhere, the interior of Old St. Paul's was crowded and gorgeous, for bishops, nobles, and especially the rich citizens of London vied with each other, through life and after death, in the sumptuousness of their gifts. Its most conspicuous feature was the elevated chapel of St. Paul which stood near one of the tower piers, and, with its winding stairway, was richly carved in wood. Its most costly and famous ornament was the shrine of St. Erkenwald, sculptured and gilded and sprinkled with jewels, holding the place of honor just back of the great reredos. The Lady-chapel was shut off from the retrochoir by a high screen. Before it was built a street ran close to the end of the choir, and here stood the Church of St. Faith. Afterward this name was given to the crypt which underlay the whole choir of the cathedral, as it was set apart for the use of the dispossessed congregation.

The walls of the close, or precinct, which surrounded Old St. Paul's and was much larger than the open space we see to-day, were pierced by six gates that were shut at night, the chief

¹ Even the town residence of the bishops of London, the modern "London House," is now at Westminster.

² Dugdale, copying from Stow, states that the length of Old St. Paul's was 690 feet; but the assertion is not confirmed by the measurements of separate portions which he gives, and the figure 6 was probably a printer's error for 5.

Winchester, now the longest church in England, measures about 560 feet. The only one as tall as Old St. Paul's is Westminster, where again we find a height of 101 feet, while York comes next with 90 feet.

ST. PAUL'S FROM CHEAPSIDE.

one standing opposite the west end of the cathedral at the top of Ludgate street. Behind the walls house-fronts and peaked roofs gathered themselves together, and even within the precinct were many buildings, some pressed close to the mighty fabric of the church itself. In fact, Old St. Paul's stood like a Continental, not like an English cathedral, architecturally as spiritually bone of the city's bone, with the life-blood of human activity centering in its mighty heart.

Close to its northern side, toward the west, lay the bishop's palace, "London House," with its gardens and private chapel and door of communication into the nave. Opposite rose the Church of St. Gregory, clinging to the wall of the south aisle and the Lollards' Tower, and lifting its steeple as high as the ridge of the cathedral roof. Behind St. Gregory's rose the octagonal chapter-house, placed in an unusual

long south side which were not half concealed by the cloisters and St. Gregory's were so built against by houses and shops that little save the upper stories and the great door in the transept could be seen.

An irreverent medley, modern taste may say; a motley, illiterate architectural crowd, intrusive at the best and in many of its parts distressingly plebeian. But how picturesque, how natural, how vital, how expressive of a cathedral's function as the soul of the city's life, as a temple of the people's God!

III.

EIGHTEEN years of work were needed to repair the injury when, in 1444, the spire of St. Paul's was struck by lightning. But another bolt which fell in 1561 did infinitely greater damage. Then the spire, which was of wood

W. J. Baer

(Reproduced from a restoration, prepared for Longman's "Three Cathedrals Dedicated to St. Paul," in which, for want of exact data, the western towers of the cathedral and the spire of St. Faith's were omitted.)

way in the center of the quadrangle formed by the cloisters. Just behind the palace lay another cloister, used for burial, and this too encircled a chapel first built by the father of Thomas Becket. Near the northeast corner of the choir stood the famous outdoor pulpit called "Paul's Cross," and opposite the east end soared a great belfry with a leaden spire. These were only the chief of the large buildings which in the early sixteenth century surrounded St. Paul's; and, moreover, all those parts of its

incased in lead, was wholly destroyed, and all the roofs fell in heaps of rubbish into the church. The spire was never rebuilt, and though the other portions were at once repaired, it must have been in a slovenly fashion; for, sixty years later, "the princely heart" of James I., says Stow, "was moved with such compassion to this decayed fabrick" that he made a state pilgrimage to the cathedral to hear a sermon of appeal in its behalf, and appointed a Royal Commission to consider means for restoring it. The cor-

roding of "coal-smoak," by the way, was even in those days cited as one perpetual source of trouble.

The foremost architect of the time was Inigo Jones, and to him the repairs were intrusted. He renewed the sides in a "Gothic manner" which must have been very bad; added a "Grecian portico" which was very good of its kind, but wholly out of place at the west end of such a church; and then was prevented by the explosion of the Civil War from confounding confusion further. Before the year 1640 as much as £10,000 had been contributed toward his work in a single year, but in 1643 the entire amount was only £15.

As early as the fourteenth century there had been clerical protests against the desecration of the nave of St. Paul's by "people more intent on buying and selling than on prayers." As time advanced the scandal grew till the church became a veritable fair-ground. "Paul's Walk," of which we read in many an old play and pamphlet, was the space between the north and south doors of the nave. Here horses and mules were led through the church, fops displayed their clothes and consulted their tailors, lawyers met their clients, and maids and children romped, while near a certain pillar servants regularly stood for the inspection of intending masters. "I bought him in Paul's," exclaims Falstaff of Bardolph. A letter written by a London gossip in the year 1600 says, "Powles is so furnish that it affords whatsoever is stirring in France, and I can gather there at first hand sufficient to serve my purpose." A tract of this period is called, "How a Gallant should behave himself in Paul's Walk," and a little later Bishop Earle declares that the place is "the great exchange of all discourse, and no business whatsoever but is here stirring and afoot. . . . It is the synod of all pates politick . . . the thieves' sanctuary."

When we charge Calvinism and republicanism with the damage they did to English churches, it is well to remember that reverence for sacred buildings was on the wane even in late Catholic days, and had almost wholly departed while the heads of kings were still unthreatened and Anglicanism was still supreme. I have merely hinted at the abuses practised in St. Paul's, and they were only a type of those which, to a greater or less extent, prevailed in

DRAWN BY W. J. BAER.

PAUL'S CROSS, FROM AN OLD PRINT.
(FROM MURRAY'S "HANDBOOK TO THE CATHEDRALS OF ENGLAND.")¹

every English cathedral of the time. Surely there was some excuse for the Puritans when they ordered Paul's Cross removed in 1642, confiscated the houses and revenues of the dean and chapter and likewise everything in stock for the use of the repairers of the church, and, finding it too big to be pulled down, employed it as a cavalry barrack, and built two stories of hucksters' booths into the new Grecian portico. They but carried a step further the desecration and damage that had been going on for centuries. It was only in part their fault that when Charles II. got back "to enjoy his own again" the special possession which he called Paul's Church was a mere mangled mass of masonry. Stow spoke only of the final stage in a long process when he wrote that "by the votes of Parliament . . . the very foundation of this famous cathedral was utterly shaken to pieces."

In 1663 feeble and futile efforts were begun to bring back its life to St. Paul's; and in 1666 Dr. Wren, whom we know as the great Sir Christopher, was asked to suggest a more efficient scheme. His answer showed that he would have proceeded like Inigo Jones, modifying "the Gothick rudeness of the old design"

¹ The folly of seeking exact information in old pictures is shown by this print, where, to make a "nice

picture," the artist has calmly reduced the length of the choir of Old St. Paul's from twelve to four bays.

with casings, additions, and alterations "after a good Roman manner." Indeed, his accompanying drawings prove that, had he got to work, he would have been a much more radical innovator than Jones. But less than a week after they were approved his plans and estimates were set at naught by the "Great Fire," which broke out on September 2. Pepys tells us how, on September 7, he had "a miserable sight of Paul's Church, with all the roof fallen in and the body of the quire fallen into St. Faith's."

Can we much regret that Wren was thus enabled to leave us a church wholly in a "good Roman manner"? Had there been no fire in 1666, our legacy would not have been Old St. Paul's in any adequate sense. It would have been a mongrel structure, where the last of England's great architects would have done gross injustice to the work of his forerunners, and small justice to the style of his time or to his own immense ability.

IV.

EVERY one who has seen Westminster Abbey knows that, when Henry VII. built his chapel, Gothic architecture still ruled in England. But long before Tudor times the great movement we call the Renaissance of Art and Letters had begun in Italy.

A vague reverence for the traditions of antiquity had never wholly perished on Italian soil, but no real knowledge of what they meant illumined the medieval period. The Greek language had been entirely forgotten by Petrarch's Italy; she despised the ruins of Rome, and her architects were building Gothic structures, although the difference between their work and northern Gothic proves that, all unconscious of the fact themselves, their native sympathies were with the structural ideals of antiquity. It is true that, long before, in the first half of the thirteenth century, Niccolò Pisano had fed his talent on the beauty of ancient sarcophagi. But he was ahead of his time; his own works are Gothic in form if often classic in feeling, and the blooming season of Italian Gothic architecture stretched all through the fourteenth century. The revival of secular learning, the rise of what is called "humanistic scholarship," began with Petrarch and Boccaccio in the middle of this century. It gradually excited an interest in the art as well as in the literature of the past, and the renaissance of classic architecture may be dated from the year 1403, when, amid the long-neglected ruins of Rome, Brunelleschi caught the inspiration which soon lifted into the Florentine sky the enormous dome of Santa Maria del Fiore. The succeeding years, up to about 1500,

form the experimenting, growing stage of Italian Renaissance architecture, and its noblest, finest time was during the next half-century.

Meanwhile the Renaissance movement, with all that it implied in all domains of thought, had been spreading further and further north. As regarded art, England was the last country to be swayed, and her old architectural manner died very hard. Henry VII.'s chapel, finished about 1516, is altogether Gothic in conception and in treatment. Even as late as the reign of his granddaughter, Gothic art still clung to the skirts of the church; the square casements and classic details of many a great Elizabethan manor-house group with the tall pointed windows of its chapel. But the fight was then practically over, and in the days of Charles I. and Inigo Jones Gothic art (it sounds much more out of date with the contemporary *art*) was quite dead and almost altogether despised. Wren heartily despised it, and rejoiced that it was dead. If left to himself, he never would have built with its bones except when he saw, as at Westminster Abbey, that "to deviate from the old form would be to run into a disagreeable mixture which no person of taste could relish"; and even Old St. Paul's did not seem to him a case like this, perhaps because Inigo Jones had already begun the mixture. It was outside influence that forced him to Gothicize the plan of St. Paul's and, in some of his parish churches, to "deviate from a better form" and to give them a mediæval outline curiously at variance with the classic character of their details.

It is foolish to ask whether Wren "ought" to have felt as he did, whether England and the world "ought" to have abandoned Gothic for Renaissance art. They had no choice in the matter. Even before the new forms of the south were arrayed against it, Gothic art was dying from internal causes. Its constructional and its ornamental schemes had arrived at a point whence they could develop no further. Truth and dignity in construction, charm and appropriateness in ornament, had alike been lost. There was no longer any feeling for beautiful proportions or for features which should explain their purpose while they gratified the eye. Nothing new could grow out of the elements which, beginning with the sturdy walls and piers and arches of the Norman, had passed through varying phases of strength and loveliness into the mechanical fantasticality of late Perpendicular Gothic, with misshapen windows, shrunken traceries, and flattened arches, with stalactite vaults, reed-like bundles of shafts which almost denied their columnar origin, and gridiron patterns for decoration. And an architectural style never stands still: when it ceases to grow it decays and makes room for something else.

DRAWN BY JOSEPH PENNELL.

ENGRAVED BY W. H. MORSE.

THE FRONT OF ST. PAUL'S FROM FLEET STREET.

But even if Gothic art had still been vigorous, it would have given way to Renaissance art. The change of style expressed a change in esthetic temper, and this itself was only a part of the great general change which had come over the mental attitude of Europe. Medievalism in religion, in the pursuit of knowledge, in morals, and in manners, had been swept away; how could it survive in art? The new world had gained intellectual liberty by basing itself upon a combination of Christian and classic learning; its art could not be anything but a Christianizing of classic elements. The century which had buried Bacon and Raleigh, which had given birth to Newton, to Milton, and to Cromwell, to Hobbes and Locke, to Bunyan and Burnet, which had cut off the heads of King Charles and his archbishop, and had driven King James from the throne, could not express itself in the forms of Gothic art. Sir Christopher Wren, who was a Protestant to the backbone, and who wrote the preamble which explains that the Royal Society was founded to make provision for the study of "Natural Experimental Philosophy," could no more have chosen to build like Alan of Walsingham or William of Wykeham than like Erkenwald himself. The seed that Brunelleschi sowed grew as naturally, as inevitably, as that which was dispersed with Wyclif's ashes. The dome of St. Paul's followed as logically after the spire of Salisbury as the Royal Society after the medieval schoolman's lecture.

It matters nothing whether abstract criticism thinks dome or spire the finer, prefers the Gothic or the Renaissance ideal; Wren lived in a creative age and could not doubt that, to work well, he must use the style then alive and developing. Like all great architects, he had small regard for mere antiquarianism or sentiment when they stood in the way of his own success. Yet, like all great architects, he did not think of styles merely from the esthetic point of view. He knew that changes in style resulted from changes in construction, that these were brought about by new practical needs, and that, in consequence, the style which looked most beautiful to him was also the best for his clients' service. Practical requirements were uppermost in his mind. The most radical alteration he proposed before the fire was to cut off the inner corners of the four interior arcades of St. Paul's where they met beneath the tower, so as to "reduce this middle part into a spacious dome or rotunda, with a cupola or hemispherical roof," by which means the church "would be rendered spacious in the middle, which may be a very proper place for a vast auditory." He was ruled, in short, by the wish to fit the old Catholic edifice for the new Protestant form of worship. The days of vica-

rious services, of gorgeous long processions, of relic-worship, and of constant private prayer at a score of minor altars had departed; the days of congregational worship had come with their new necessity for massing an audience within clear sight and hearing of the ministrant and preacher. The old cathedral type was no longer appropriate; the new architectural manner of the Renaissance stood ready with a new type promising greater convenience.

v.

THE fire had prepared a path for Wren, but antiquarians, churchmen, and bureaucrats hampered his advance. In consequence, St. Paul's is inferior in many ways to what it might have been. The story of its building, could I tell it in detail, would give much sad comfort to modern architects who think that the buffets they meet and the bonds they must wear are an invention of our own degenerate days.

Immediately after the fire Dr. Wren was named surveyor and principal architect for the rebuilding of London, and one of the commissioners "for the reparation of St. Paul's." He saw that it could not be repaired, but others refused to agree with him and began to patch up the nave. Soon, however, Dean Sancroft wrote him: "What you whispered in my ear at your last coming hither is come to pass. Our work at the west end of St. Paul's is fallen about our ears. . . . What we are to do next is the present deliberation, in which you are so absolutely and indispensably necessary that we can do nothing, resolve nothing, without you." In July, 1668, an order was given to remove the ruins of the eastern part of the church; but fresh attempts were made to restore the nave, and only in 1670 was it "fully concluded that, in order to a new Fabrick, the Foundations of the old Cathedral, thus made ruinous, should be totally cleared." This work was practically finished by the spring of 1674, and meanwhile Wren had been discussing with himself the plans for a new cathedral, and making drawings and models for the eye of the king and commissioners.

Of course, now that a wholly new church was required, he offered designs in which no trace of the medieval cathedral scheme survived. First he drew "several sketches merely for discourse sake to find out what might satisfy the world." Then, having observed "that the generality were for grandeur, he endeavored to gratify the taste of the Connoisseurs and Critics with something coloss and beautiful, conformable to the best stile of the Greek and Roman architecture," and in various drawings and a model (which is still preserved at South Kensington), he presented the church of which

THE FRONT OF ST. PAUL'S FROM LUDGATE HILL.

PLAN OF ST. PAUL'S AS FIRST DESIGNED BY WREN.
(FROM MURRAY'S "HANDBOOK.")

the plan is here reproduced. This plan suggests a magnificent interior most intelligently carried out. In this huge octagonal space, and in the symmetrical arrangement of the four arms, convenience has been well secured, yet ecclesiastic dignity has been preserved. Despite the presence of the eight immense piers needed to support the dome, the area thus provided is far better for congregational services than the long narrow limbs and serried colonnades of medieval churches, while the short nave (which is really more like a large vestibule) provides for an overflowing assembly, gives place for entrances of fitting grandeur, and supplies a point of view whence the magnificence of the great octagon can be fully appreciated.

The exterior of this favorite design of Wren's¹ is far less satisfactory. Whether judged for beauty or for ecclesiastic feeling, nothing could be worse than the curved walls which form the angles between the four limbs of the cross, and the small dome which rises over the nave groups most inharmoniously with the larger one. This larger dome, evidently studied from St. Peter's, is the best feature of the design; but Wren improved upon it when he actually came to build, and so, we may believe, he would have improved upon the rest of the design had he been allowed to keep to the general scheme which it indicates.

¹ Wren's grandson, who is our authority for most of his beliefs and experiences, says in the "Parentalia" that Sir Christopher "always seemed to set a higher value on this design than any he had made before or since, as what was labored with more study and success, and,

The hindrance came from "the chapter and some others of the clergy," who thought his model "not enough of a Cathedral fashion, to instance particularly, in that the Quire was designed circular," and that there were no extended limbs with aisles. Drawings in which the choir was enlarged were then presented; but the "Criticks" were still dissatisfied, and Wren was obliged to begin afresh, using the old "Cathedral form," but, as he said, trying so to rectify it "as to reconcile the Gothick to a better form of Architecture." Several designs resulted, one of which was approved by Charles II., who, in the warrant immediately issued for beginning the work, explained that he had "particularly pitched" upon it, "as well because we found it very artificial, proper and useful, as because it was so ordered that it might be built and finished by parts." The architect was directed to commence with the choir, and the king gave him "liberty in the prosecution of his work to make some variations, rather Ornamental than Essential, as from time to time he should see proper." Whereupon Wren did begin, took the liberty to vary essentials in the most fundamental way, and erected a church almost incredibly unlike the one that his royal master had approved. The drawing which bears Charles's signature is still preserved. It is a front elevation showing a portico with fourteen columns, a low body with transepts having plainly treated windows, tiny turrets instead of western towers, and the most astonishing substitute for a dome. Fancy a very low spherical roof supporting a very tall drum with large windows between its groups of pilasters; above this a narrow, elongated, fluted dome, not so tall as the drum that bears it; and above this again a spire composed of six arcaded stories, each encircled by a railing, which gradually decrease in diameter toward the top, where the finial shows a series of diminishing balls—a spire that can almost be likened to an unusually slender Chinese pagoda. This was the chief feature of the design which King Charles preferred to all others. Who can regret that Wren did not regard it as "essential," but went boldly back to the dome he had first conceived? The clients of that day, we see, were no wiser than the clients of ours. May architects of our day justify their own occasional lapses from the conscientious fulfilment of a definite commission by citing Sir Christopher's example? Perhaps—if they are very sure they are Sir Christophers and are working for the nation and posterity rather than for an individual who, as we can fancy was the had he not been overruled by those whom it was his duty to obey, what he would have put into execution with more cheerfulness and satisfaction to himself than the latter."

case with King Charles, cares but little one way or the other. At all events, Charles had been long in his grave before the dome was built. The first foundation stone of the new church was laid at the southeast corner of the choir on the 21st of June, 1675. The top stone of the lantern on the dome was placed in 1710, in the days of Good Queen Anne. Not only King Charles, but King James, and King William, and Queen Mary had died as St. Paul's was growing. But, on the other hand, not only Wren himself, but Strong, his master-mason, and Henry Compton, the bishop of London, saw it begun and saw it finished. Its total cost, including subsequent decorations, was £736,752 2s. 3¼d., and was largely covered by a grant to the commissioners of the tax on coal.

VI.

THE length of St. Paul's is 500 feet, exclusive of the steps of the portico; the spread of its transepts is 250 feet, and the breadth of each of its arms is 125 feet. In plan it is a Latin cross of the typically English kind, with nave and choir of equal extent.

As soon as we enter it, we feel the impropriety of choosing such a plan for a church whose main feature is a lofty dome. At first we scarcely see that there is a dome; it does not reveal its importance until we come almost underneath it, and then it seems to have little relationship with the long perspectives behind and before us. Their lines do not lead the eye up to its lines. Their narrow horizontal vistas are in discord with the vast sweep of its base and its broadly soaring sphere. They cry out for some form of central ceiling which would unite instead of separating them. It cries out for a substructure which would everywhere predict its character and confess its preëminence.

Many other domed churches in western Europe have extended naves, but in none of them are the other three limbs nearly as long as in St. Paul's; and in the case of the two which are most famous, the designer of the dome was not responsible for the nave.

During the Gothic period Arnolfo was directed by the city of Florence to build a cathedral of exceptional grandeur; so he designed Santa Maria del Fiore with a long nave, but with a very short choir and transept, and a central area of unprecedented size. At his death, about the year 1300, this area was still unroofed; no one knew how he had meant to cover it, for probably he had not known himself; and no one dared suggest a method until, in 1420, Brunelleschi proposed to revive the

dome as the Romans had used it in their Pantheon and their baths. Under Byzantine influence Romanesque architects had erected many small domes, notably those of St. Mark at Venice and of St. Front at Périgueux. But after the development of the Gothic style domes were less often used, were constructed with a system of ribs, like vaulted ceilings of other kinds, and, except in the case of one or two Italian structures, were domical as regarded the interior only. Brunelleschi naturally sought counsel of the Romans when he wished to build an enormous roof, domical inside and out; and he naturally adopted their ribless system of construction and their decorative details.

Thus we see why there is architectural discord in Santa Maria del Fiore. And thus

PLAN OF ST. PAUL'S.
(FROM MURRAY'S "HANDBOOK.")

we learn once more that great architectural innovations are not inspired by mere changes of taste, but by new constructional needs. As, however, these needs make themselves felt in times of general change, mental plasticity, and development, the new scheme naturally meets a nascent taste, or turns wavering preferences in its own direction. Brunelleschi's dome, fathered by a practical necessity, was at once acclaimed as an esthetic triumph. Its success led architecture into a new path; and its offspring are not only all the other domes, but all the Renaissance buildings of every kind with which the Western World is covered.

When St. Peter's was projected, in the beginning of the sixteenth century, Bramante designed it in the Renaissance style with an enormous dome; but he clung to the long

by the wishes of the clergy,—always tender of tradition and averse to novelty,—later Italian architects often combined a long perspective with a swelling dome. The first domed church built in Paris, the one attached to the Convent of Val-de-Grâce, shows the same arrangement. The chapel royal of the Hôtel des Invalides is the first Renaissance church, on northern soil at all events, where we find a scheme comparable in architectural unity and logic to those which Oriental builders had elaborated many centuries before. It is square in plan, and its dome rests on an octagon the four greater arches of which open into four short and equal limbs, while the four smaller ones open into chapels occupying the corners of the square and covered with low domes.

It would be rash to say that the combination of a dome and a long nave cannot be well effected.

DRAWN BY JOSEPH PENNELL.

THE CHOIR.

ENGRAVED BY K. C. ATWOOD.

medieval nave, and so too did his immediate successors, San Gallo, Fra Giocondo, and Raphael. Then came Peruzzi, who suggested a Greek cross for the plan, and then the younger San Gallo, who went back to the Latin cross. When Michael Angelo was appointed architect, he too preferred the more compact plan, and his design was carried on by his successors, Vignola, Della Porta, and Fontana. But before the church was quite finished Pope Paul V. bade Carlo Maderna increase its size by the prolongation of the nave.

Influenced by these two famous churches, and doubtless also, like Sir Christopher Wren,

But certainly the most successful domed interiors are those where we find the most compact and symmetrical disposition of parts, while next in excellence come those where choir and transept are very short and, as is the case at St. Peter's, the nave's immense breadth supports its length and predicts the presence of the dome. If the nave of St. Paul's were wider, we should be less distressed by its length; but the chief defect of the interior is the vast length of the choir, which leaves the dome poised upon stretching colonnades, unsustained to the eye by any massive bulk of wall. Even the transept is too long for good effect; and all this

DRAWN BY JOSEPH PENNELL.

ENGRAVED BY H. E. SYLVESTER.

INTERIOR OF ST. PAUL'S, LOOKING FROM THE NAVE INTO THE CHOIR.

deference to medieval precedent has not really increased the commodiousness of the church, except from a superficial point of view. I mean that more people can enter it than can profit by their entrance. I have seen Canon Liddon preaching beneath the dome when I could not hear him, although I stood at a considerable distance from the transept door; and of course I was still more entirely excluded from the rest of the service.

However, all things considered, we marvel less that Wren should have been forced to plan his church in this way than that he should have preferred a more compact plan himself; for he knew little or nothing of the Orient, and could not have been helped by the chapel of the Hôtel

des Invalides, as this was begun in the same year as St. Paul's.

VII.

BRUNELLESCHI'S dome was built in the simple Roman way, its shape and the diameter of its base being the same as those of the area inscribed by its supports. Eight piers and eight connecting arches bear a wall or "drum" in the shape of an octagon, and from this wall spring the eight sides of the dome. But the dome of St. Peter's is a polygon of sixteen sides, and only four piers sustain it; so its builders employed what architects call "pendentives" — curving surfaces of wall which, filling the spaces between the arches, unite above in a con-

DRAWN BY JOSEPH PENNELL.

THE DOME FROM ST. PAUL'S WHARF PIER.

tinuous wall of the shape desired for the base of the dome; and the picture on this page shows how, by the use of pendentives, the circular drum of St. Paul's was accommodated to the octagon formed by the eight supporting piers. Above the plinth at the base of the drum is a plain surface of wall with a balustraded gallery, and above this a tall colonnade pierced with windows; and then the dome curves in to its open central "eye."

The dome of the Val-de-Grâce was begun by Leduc about 1655 and finished in 1685. It would be interesting to know how far it had progressed by 1665, the year before the fire, when Wren wrote, "I have busied myself in surveying the most esteemed Fabrics of Paris and the country round"; for in a very important point it presents a strong contrast to the domes of Italian churches, and a close likeness to those of the Invalides and St. Paul's.

The solid brick wall which forms the lower portion of Brunelleschi's dome divides, about half-way up, into two shells with a space of several feet between them; but the expedient was purely constructional, as distinguished from architectural, for the walls have the same curve, and so, inside and out, the form of the dome is the same and its dimensions are practically alike. St. Peter's dome — inside of brick and outside of stone — is constructed in a similar way. But at the Val-de-Grâce there are two distinct and different domes — a comparatively low spherical vault of stone and, starting from a much taller drum and therefore rising much higher, an external dome of wood covered with lead; and at St. Paul's we find the same arrangement. But whether Wren learned this from Leduc or not, one feature of his dome was all his own, a third wall rising between the other two, a cone-shaped dome of brick which helps to solidify the whole structure but was specially designed to support the stone lantern, ninety feet in height and immensely heavy.

This intermediate cone, like the doubled walls of Santa Maria and St. Peter's, was a purely constructional expedient. But the separation of the inner from the outer dome was an architectural idea in the most fundamental sense of the term. If original with Wren, this idea proves that he possessed creative power of the noblest sort, and, in any case, his conception and execution of it are his highest titles to fame. Yet it has often led to his condemnation as an "untruthful" and "insincere" architect by those who do not understand the meaning of the words as thus applied.

His purpose, of course, was to make his dome as beautiful as possible both inside and out. In pursuing such an aim, an architect must respect broad structural veracity. He must not build a dome outside where there is none within, or cover a domed ceiling with, for instance, a square external tower. His exterior must interpret his interior; but the interpretation need not be a detailed explanation. Over their stone vaults Gothic architects raised wooden roofs of far higher pitch; and above their central lanterns they carried square towers to a much loftier height, and crowned them with stone or timber spires which certainly expressed no interior feature. Wren's two domes are the legitimate successors of forms like these, and his intermediate cone is a fine constructional expedient, as lawful as the timber framework with which Gothic architects braced and tied their spires of stone.

There can be no question with regard to the esthetic advantage of the diverging domes, since they give the architect perfect freedom, enabling him to care in a special way for interior and for exterior effect. It was no new discovery that a given set of proportions may not look equally well inside and outside a building. Gothic architects could not carry a great church too high for increase of majesty and charm in the interior; but the higher they carried it, the harder was the task of preserving grace in the exterior. Compromise offered the only relief from this difficulty. But there was another way out of the opposite difficulty, the one which dome-builders had to meet, and the seventeenth century was intelligent enough to find it.¹ We wish Byzantine builders had found it when we see the most beautiful ceiling in the world, the wide hemispherical vault of St. Sophia in Constantinople, appearing outside the church as a flat saucer-like roof, quite devoid of dignity and of grace. The dome of St. Peter's is very beautiful both within and without; yet within it seems almost too tall despite its enormous span; and outside it can be fully appreciated only from a point so distant that the body of the church sinks into comparative insignificance beneath it. The desire of Sir Christopher and his French contemporaries was to raise their outer domes so that they might produce their full effect from near as well as from distant points of view, and surely it was a lawful ambition. We cannot think the great gilded sphere of the Invalides or the fluted gray cupola of St. Paul's a foot too high; but fancy them revealed as ceilings up to the base of their lanterns!

¹ Although Renaissance architects were probably not helped by the fact, this solution had already been found some time before by certain Oriental builders. The beautiful outer dome of the mosque at Ispahan, which dates from the fifteenth century, is a shell of wood covered

with lead, rising far above the inner dome; and of similar form and fabric are now the domes of St. Mark's in Venice, originally built low and solid, but covered in the fourteenth or fifteenth century with tall wooden shells.

DRAWN BY JOSEPH PENNELL.

THE NORTH AISLE OF THE NAVE.

ENGRAVED BY J. W. EVANS.

Increase of height was secured, not by elongating the sphere itself, but by making the drum more prominent. Brunelleschi, like the Romans and all Oriental builders, used a very low drum; Michael Angelo raised his much higher, saying that he wished to "swing Brunelleschi's dome in the air." But Wren, with his doubled cupola in mind, could be much bolder still; and we cannot too greatly admire his design where, though the drum has two stories and one is immensely tall, unity is perfectly preserved and the proportions are so beautiful that the dignity of the dome itself is merely increased by the magnificence of its base. Naturally the drum of the interior dome is not nearly so high, being proportioned to its own altitude. Indeed, the height of the outer drum is almost as great as that of the ceiling as a whole.

In the chapel of the Invalides the "eye" of the domed ceiling is very wide, and through it we look up at an immense painting which covers the surface of an intermediate dome of flattened shape. At St. Paul's, through a much smaller opening, we look up into the mysterious area of the tall brick cone. The chance to secure effects like these should not be forgotten in weighing the merits of the system of divergent domes, nor the many ways in which such domes permit the builder to lighten his fabric on the one hand, to brace and support it on the other. The lantern on St. Peter's could not be built as large as at first intended, yet the dome has had to be strengthened by iron bands; the dome of St. Paul's is still as firm and steady as at first. Never in St. Paul's, I may add, do we receive a more tremendous impression than when, stand-

ing in the gallery that surrounds the "eye," we look downward into the church, upward into the lofty cone.¹

Far though it falls below the outer dome, Wren's great ceiling is still too high. Its aspect speaks of mystery and grandeur rather than of beauty. Of course it seems even taller than it is because of the smoky air which fills it—thick almost as an actual cloud; and it will seem lighter, more graceful, more beautiful, if it is ever properly decorated. But the outer dome is and always will be Wren's greatest triumph. Can we study such a work as this, look back to its origin in the dome of the Pantheon, and then say that Renaissance art is only a "copy" of antique art? or, as actually has been said, that it is worse than a copy, being a "corruption"?

VIII.

WE are often told that the beauties of St. Paul's are due to Wren, and its faults to his employers. But this is true only in part. Wren did as well as one could with the plan he was forced to Gothicize, especially excellent being the way in which he arranged the supports of his dome so as to leave, from end to end of the church, a clear vista through all the aisles. He rightly asked for brilliant mosaics in the dome, but was forced to see it painted in dark, heavy tones, while all the rest of the interior was left cold and bare. In spite of his actual tears of protest, the Duke of York, intent upon bringing back some day the Catholic form of worship, insisted upon the chapels at the western end, which greatly injure the external effect. And the building commissioners insisted upon the balustrade which crowns the external walls, although Wren showed them that a plain plinth above the entablature formed a sufficient finish, and

compared them to ladies who "think nothing well without an edging."

But Wren was himself responsible for the weak way in which the vaulted ceilings of the four limbs spring from a low Attic order, and also for the ugliest features in the whole church—

¹ The dome of the Invalides was designed by the younger Mansard shortly before the year 1700. Its intermediate dome is chiefly a decorative, not a con-

structional, feature like the cone at St. Paul's. The lantern is borne by the outer dome, and, like this, is of wood.

DRAWN BY JOSEPH PENNELL.

those superimposed arches which, alternating with the great arches that open into the four limbs, help them to support the dome. These features show in the pictures on p. 655 and p. 659. We are glad to know that after they were built Wren disliked them extremely. But the remedy he proposed does not strike us as quite happy: he suggested that groups of statues be placed in the upper window-like openings and backed with make-believe curtains of plaster! As a whole the interior of St. Paul's lacks unity and repose, while the choice and proportioning of its features do not reveal a very delicate artistic sense, and its scheme of sculptured decoration shows neither the fertility in invention, the exquisite taste, nor the skilful touch which characterize the contem-

porary work of France. Even as a compromise between two architectural ideals it might, we feel, have been a little better managed.

The exterior is much more successful, although here again we cannot give unstinted praise. A want of unity between the dome and the church is still apparent, the one standing on the other almost like an independent structure raised on a lofty platform; yet in itself this platform is superb in mass and silhouette. If we examine the construction of the lateral façades, we find a want of truthfulness which may be criticized with much more justice than the bold divergence of the inner and outer domes. The real walls of the exterior end with the entablature of the lower range of pilasters which defines the altitude of the aisles. Above this

DRAWN BY JOSEPH PENNELL.

THE FONT.

ENGRAVED BY ALLEN IRWIN.

point the wall, with its second range of pilasters, is a mere screen, standing free and hiding the true clearstory wall as well as the flying buttresses which spring to this from the top of the true aisle wall. I do not say the device was a worthy one; but a frank confession of the long aisles Wren was forced to build would have injured that effect of monumental unity and simplicity which is the essence of Renaissance as compared with Gothic art, and would have resulted in a mass far less well adapted than the one we see to form a pedestal for the mighty dome. And, after all, if Gothic architects did

not build screen walls, they were not ashamed, in England at least, to hide their flying buttresses under the roofs of their aisles.

The semicircular porches which finish the transept-ends are not very harmonious features; and, despite its dignity, the western front has patent faults. Wren proved himself a true descendant of English Gothic builders when he misrepresented the breadth of his church by placing the towers outside the line of the lateral walls; and he sinned in another way by making the upper colonnade of his portico shorter than the lower one—unity of effect is dis-

turbed, and the second story looks heavier than the first, whereas it might well have been lighter.

Yet the merits of this exterior far outweigh its defects, for though we may object to certain features and arrangements, the church as a whole never fails to impress in the profoundest way both the eye and the imagination. It

it could hardly have been as imposing as to-day, when great streaks and patches of inky black accentuate the pallor of more sheltered portions.

IX.

Of course we ought to say more about the character of Renaissance architecture and the

DRAWN BY JOSEPH PENNELL.

ST. PAUL'S FROM WATERLOO BRIDGE—A FOGGY MORNING.

ENGRAVED BY H. E. SYLVESTER.

is a magnificent building, and we cannot always say as much of buildings in which we discover fewer special faults. People who have no eye for the picturesque sometimes complain of its color or, rather, of the way in which smoke and soot have altered its color. But fresh in the first whiteness of its Portland stone,

way in which it is illustrated by St. Paul's. But how, in a single chapter, could we attempt to do for this great style what, in a dozen chapters, we found it impossible to do completely for the medieval styles? Now we can make room merely for one or two historical facts of another sort.

Few churches as great as St. Paul's have

been built in so short a time ; and I think no architect but Wren has been able to say of such a church that it was all his own. But in some ways Wren paid very high for his long life and noble opportunity. Constantly thwarted in his work, he was also constantly assailed by jealousy and slander, and, at the age of eighty-six, when the fabric of St. Paul's had long been complete but there was still much to do in minor matters, he was dismissed from the office he had held during forty-nine years to make room for a favorite of King George's. He must have felt, as we feel, that the disgrace of this act did not rest upon him. He soon retired to Hampton Court, and there, says his grandson, "free from worldly cares, he passed the greater part of the five last following years of his life [he died at ninety-two] in contemplation and studies, and principally in the consolation of the Holy Scriptures, cheerful in solitude, and well-pleased to die in the shade as in the light."

A vast crypt stretches beneath the whole of St. Paul's, and here lie the bodies of most of those whose monuments appear in the church above. Sir Christopher himself lies at the east end of the south aisle. In the place where he ought to have rested, under the center of his dome, lies Lord Nelson, who ought not to have been buried in St. Paul's at all—if it is true that he cried to fate to give him "Victory or Westminster Abbey." Near Wren sleeps our countryman Benjamin West, with Reynolds, Turner, Lawrence, and other artists of less renown ; near Nelson sleep Wellington, Collingwood, and other great soldiers and sailors ; and of course noted churchmen are not wanting.

The best works of sculpture which St. Paul's can show are the beautiful choir-stalls carved in wood by Grinling Gibbons, under the eye of Wren. Among all the monuments there is only one of high artistic merit. This is Wren's, and, as we have often heard, it is simply the church itself. The famous inscription which ends, *Lector, si Monumentum requiris, circumspice*, was written by his son and placed on his tomb, but is now repeated over the door of the north

THE DOME FROM THE RIVER.

transept-arm. A full translation runs: "Beneath is laid the builder of this church and city, Christopher Wren, who lived more than ninety years, not for himself but for the good of the State. Reader, if thou askest for a monument, look around thee." And I think the epitaph is as fine in its way as the monument.

Except for a brief period, when the fiery light of the struggles which introduced and assured the Reformation threw a few figures into heroic relief, the bishops of London have not often been conspicuous men. Their power as bishops

DRAWN BY JOSEPH PENNELL.

THE WEST DOOR.

ENGRAVED BY W. H. MORSE.

was not commensurate with the power of their town. The metropolis of England in every other sense, London has ranked ecclesiastically with towns as small as Ely and Wells. Pope Gregory intended that it should be the archiepiscopal seat, but St. Augustine decided otherwise, and his arrangement has never been disturbed. To rise as high as he could in the church, to have the best chance for rising in the state, a bishop of London had to get himself transferred to the tiny city of Canterbury. But Bon-

ner and Ridley, Grindal and Sandys, and John Aylmer, the tutor of Lady Jane Grey, were bishops of London in the sixteenth century, and in the seventeenth Laud and Judson and Compton; while among the deans of the chapter in these troublous times were John Colet, the friend of Erasmus; Richard Pace, the friend of Wolsey; Alexander Nowell, whom Queen Elizabeth rebuked for "papacy" in his cathedral; John Donne, the poet; and William Sancroft, who, after he had helped much toward

the rebuilding of St. Paul's, was raised by King Charles to the throne of Canterbury. Among recent names those of Bishop Tait, afterward archbishop too, and of Dean Milman and Dean Church, are the ones which the world will remember longest.

X.

SEEING the dome of St. Paul's afar off or close at hand, lighted by the faint city sunshine, wrapped in banks of mist like a mountain's shoulder, or outlined against a midnight heaven, who can deny that, despite all the beauty of Gothic spires and towers, a dome is the noblest crown that a great aggregate of human homes can carry? In the measureless panorama of London what are the towers of Westminster, what would be the spire of Salisbury, compared with its titanic bulk, so majestically eternal in expression, yet so buoyant, so airy, that when the clouds float past it we can fancy it soars and settles like a living thing?

The dome of St. Paul's rising above a town like Salisbury would indeed be out of place. But it is not in such towns that the world now puts its noblest buildings. More than at any time since the imperial days of Rome men are now dwellers in cities, and cities grow to enormous size. The dome which the Romans bequeathed us and the form of art which its use first developed, now better express our needs and tastes, and better meet our executive artistic powers than the Gothic spire and the art it typifies. Medievalism has passed out of life; is it not an anachronism to attempt its perpetuation in art? Our true sympathies lie where lay those of Brunelleschi, Michael Angelo, and Christopher Wren. We teach our children from the books of the Greeks and Romans, not of the schoolmen, and teach them intellectual freedom, not subservience to king or priest or rigid creed. We should be glad enough to sit at dinner with Pericles or Cicero, with Wren or Brunelleschi; should we like the food, the table, the manners or the talk of a thirteenth-century bishop? Could he ever grow to be one of ourselves, as Cicero might, as Brunelleschi might, did they come back to try? Of course we admire the churches he built, and in a very different way from the temples of Rameses or the mosques of the Arabs, for his blood is in our veins and the history he helped to make is ours. But lineage and material history are not the only things which control artistic development. Modern English architecture, trying to be "national" again, has interpreted the term as meaning "medieval." But even medieval architecture was really born in France, imported into England; and even St. Paul's is English, though

derived from Italian sources. The wind that sways and fertilizes the mind blows whence it listeth, infusing new qualities into the purest strain of blood; and it is these qualities—mental qualities—which express themselves in art. Not unless Englishmen themselves become medievalized can they hope to build really noble Gothic structures.

"But," some one is sure to object, "Renaissance art is pagan. We may use it for our secular buildings; we want Romanesque or Gothic for our churches." "No," another is sure to protest, "Renaissance art is papistical. Rome may use it, Protestantism should not." Each of these objections contradicts the other, and neither has the least excuse in fact. The "Grecian temple style," which for a time flourished in England and was fostered in this country by Thomas Jefferson, may be charged with paganism; but not the true Renaissance styles which Christian architects, in truly creative times, developed out of the elements of antique art. And this development took place just as the power of Rome was breaking. Renaissance art is really the art of Protestantism. It is the expression of that spirit which, amid other emancipations, wrought freedom in religious faith. St. Peter's and the countless Renaissance churches which Catholic hands have since erected simply prove that even Rome herself could not escape the influence of the great movement which produced the Reformation.

It seems impossible to-day to start quite fresh in any intellectual path. It certainly is impossible to hark back to a path, however sacred, noble, and attractive, from which, four centuries ago, our ancestors naturally and inevitably diverged. To build truthfully, spontaneously, modern men must build in the fashion that was evolved when the modern world was born. Frenchmen have remembered this truth, and it shows in the difference between modern Paris and London or New York. We may admire the forms of Gothic art more than any others, but with them no progressive nation can make a garment to cover all the needs of the twentieth century; with the forms of Renaissance art such a garment can be made; and it is doubly important for us in America to realize these facts. Reflecting that we have a fresh soil, a peculiar climate, new material needs and resources, an inventive turn of mind, an ambitious temper, and a heritage of mingled blood, we feel that we may some day arrive at a new phase of art, distinctively our own. But this can happen, in some distant to-morrow, only if we meet as well as we possibly can the practical necessities of to-day.

M. G. Van Rensselaer.

THE NAULAHKA.¹

A STORY OF WEST AND EAST.

BY RUDYARD KIPLING AND WOLCOTT BALESTIER.

XII.

WHEN he left the King's side, Tarvin's first impulse was to set the Foxhall colt into a gallop, and forthwith depart in search of the Naulahka. He mechanically drove his heels home, and shortened his rein under the impulse of the thought; but the colt's leap beneath him recalled him to his senses, and he restrained himself and his mount with the same motion.

His familiarity with the people's grotesque nomenclature left him unimpressed by the Cow's Mouth as a name for a spot, but he gave some wonder to the question why the thing should be *in* the Cow's Mouth. This was a matter to be laid before Estes.

"These heathen," he said to himself, "are just the sort to hide it away in a salt-lick, or bury it in a hole in the ground. Yes; a hole is about their size. They put the state diamonds in cracker-boxes tied up with boot-laces. The Naulahka is probably hanging on a tree."

As he trotted toward the missionary's house, he looked at the hopeless landscape with new interest, for any spur of the low hills, or any roof in the jumbled city, might contain his treasure.

Estes, who had outlived many curiosities, and knew Rajputana as a prisoner knows the bricks of his cell, turned on Tarvin, in reply to the latter's direct question, a flood of information. There were mouths of all kinds in India, from the Burning Mouth in the north, where a jet of natural gas was worshiped by millions as the incarnation of a divinity, to the Devil's Mouth among some forgotten Buddhist ruins in the furthest southern corner of Madras.

There was also a Cow's Mouth some hundreds of miles away, in the courtyard of a temple at Benares, much frequented by devotees; but as far as Rajputana was concerned, there was only one Cow's Mouth, and that was to be found in a dead city.

The missionary launched into a history of wars and rapine, extending over hundreds of years, all centering round one rock-walled city

in the wilderness, which had been the pride and the glory of the kings of Mewar. Tarvin listened with patience as infinite as his weariness—ancient history had no charm for the man who was making his own town—while Estes enlarged upon the past, and told stories of voluntary immolation on the pyre in subterranean palaces by thousands of Rajput women who, when the city fell before a Mohammedan, and their kin had died in the last charge of defense, cheated the conquerors of all but the empty glory of conquest. Estes had a taste for archæology, and it was a pleasure to him to speak of it to a fellow countryman.

By retracing the ninety-six miles to Rawut Junction, Tarvin might make connection with a train that would carry him sixty-seven miles westward to yet another junction, where he would change and go south by rail for a hundred and seven miles; and this would bring him within four miles of this city, its marvelous nine-storied tower of glory, which he was to note carefully, its stupendous walls and desolate palaces. The journey would occupy at least two days. At this point Tarvin suggested a map, and a glance at it showed him that Estes proposed an elaborate circus round three sides of a square, whereas a spider-like line ran more or less directly from Rhatore to Gunnaur.

"This seems shorter," he said.

"It's only a country road, and you have had some experience of roads in this state. Fifty-seven miles on a *kutch* road in this sun would be fatal."

Tarvin smiled to himself. He had no particular dread of the sun, which, year by year, had stolen from his companion something of his vitality.

"I think I'll ride, anyhow. It seems a waste to travel half round India to get at a thing across the road, though it *is* the custom of the country."

He asked the missionary what the Cow's Mouth was like, and Estes explained archæologically, architecturally, and philologically to such good purpose that Tarvin understood that it was some sort of a hole in the ground—an ancient, a remarkably ancient, hole of peculiar sanctity, but nothing more than a hole.

Tarvin decided to start without an hour's delay. The dam might wait until he returned. It was hardly likely that the King's outburst of generosity would lead him to throw open his jails on the morrow. Tarvin debated for a while whether he should tell him of the excursion he was proposing to himself, and then decided that he would look at the necklace first, and open negotiations later. This seemed to suit the customs of the country. He returned to the rest-house with Estes's map in his pocket to take stock of his stable. Like other men of the West, he reckoned a horse a necessity before all other necessities, and had purchased one mechanically immediately after his arrival. It had been a comfort to him to note all the tricks of all the men he had ever traded horses with faithfully reproduced in the lean, swarthy Cabuli trader who had led his kicking, plunging horse up to the veranda one idle evening; and it had been a greater comfort to battle with them as he had battled in the old days. The result of the skirmish, fought out in broken English and expressive American, was an unhandy, doubtful-tempered, mouse-colored Kathiawar stallion, who had been dismissed for vice from the service of his Majesty, and who weakly believed that, having eaten pieces of the troopers of the Deo Li Irregular Horse, ease and idleness awaited him. Tarvin had undeceived him leisurely, in such moments as he most felt the need of doing something, and the Kathiawar, though never grateful, was at least civil. He had been christened Fibby Winks in recognition of ungentlemanly conduct and a resemblance which Tarvin fancied he detected between the beast's lean face and that of the man who had jumped his claim.

Tarvin threw back the loin-cloth as he came upon Fibby drowsing in the afternoon sun behind the rest-house.

"We're going for a little walk down-town, Fibby," he said.

The Kathiawar squealed and snapped.

"Yes; you always were a loafer, Fibby."

Fibby was saddled by his nervous native attendant, while Tarvin took a blanket from his room and rolled up into it an imaginative assortment of provisions. Fibby was to find his rations where Heaven pleased. Then he set out as light-heartedly as though he were going for a canter round the city. It was now about three in the afternoon. All Fibby's boundless reserves of ill temper and stubborn obstinacy Tarvin resolved should be devoted, by the aid of his spurs, to covering the fifty-seven miles to Gunnaur in the next ten hours, if the road were fair. If not, he should be allowed another two hours. The return journey would not require spurs. There was a moon that night, and Tarvin knew enough of native roads in Gokral Seetaron, and rough

trails elsewhere, to be certain that he would not be confused by cross-tracks.

It being borne into Fibby's mind that he was required to advance, not in three directions at once, but in one, he clicked his bit comfortably in his mouth, dropped his head, and began to trot steadily. Then Tarvin pulled him up, and addressed him tenderly.

"Fib, my boy, we're not out for exercise—you'll learn that before sundown. Some galoot has been training you to waste your time over the English trot. I'll be discussing other points with you in the course of the campaign; but we'll settle this now. We don't begin with crime. Drop it, Fibby, and behave like a man-horse."

Tarvin was obliged to make further remarks on the same subject before Fibby returned to the easy native lope, which is also a common Western pace, tiring neither man nor beast. By this he began to understand that a long journey was demanded of him, and, lowering his tail, buckled down to it.

At first he moved in a cloud of sandy dust with the cotton-wains and the country-carts that were creaking out to the far distant railroad at Gunnaur. As the sun began to sink, his gaunt shadow danced like a goblin across low-lying volcanic rock tufted with shrubs, and here and there an aloe.

The carters unyoked their cattle on the roadside, and prepared to eat their evening meal by the light of dull-red fires. Fibby cocked one ear wistfully toward the flames, but held on through the gathering shadows, and Tarvin smelt the acrid juice of bruised camel's-thorn beneath his horse's hoofs. The moon rose in splendor behind him, and, following his lurching shadow, he overtook a naked man who bore over his shoulder a stick loaded with jingling bells, and fled panting and perspiring from one who followed him armed with a naked sword. This was the mail-carrier and his escort running to Gunnaur. The jingling died away on the dead air, and Fibby was ambling between interminable lines of thorn-bushes that threw mad arms to the stars, and cast shadows as solid as themselves across the road. Some beast of the night plunged through the thicket alongside, and Fibby snorted in panic. Then a porcupine crossed under his nose with a rustle of quills, and left an evil stench to poison the stillness for a moment. A point of light gleamed ahead, where a bullock-cart had broken down, and the drivers were sleeping peacefully till daylight should show the injury. Here Fibby stopped, and Tarvin, through the magic of a rupee, representing fortune to the rudely awakened sleepers, procured food and a little water for him, eased the girths, and made as much of him as he was disposed to permit.

On starting again, Fibby found his second wind, and with it there woke the spirit of daring and adventure inherited from his ancestors, who were accustomed to take their masters thirty leagues in a day for the sacking of a town, to sleep by a lance driven into the earth as a picket, and to return whence they had come before the ashes of the houses had lost heat. So Fibby lifted his tail valiantly, neighed, and began to move.

The road descended for miles, crossing the dry beds of many water-courses and once a broad river, where Fibby stopped for another drink, and would have lain down to roll in a melon-bed but that his rider spurred him on up the slope. The country grew more fertile at every mile, and rolled in broader waves. Under the light of the setting moon the fields showed silver-white with the opium-poppy, or dark with sugar-cane.

Poppy and sugar ceased together, as Fibby topped a long, slow ascent, and with distended nostrils snuffed for the wind of the morning. He knew that the day would bring him rest. Tarvin peered forward where the white line of the road disappeared in the gloom of velvety scrub. He commanded a vast level plain flanked by hills of soft outline—a plain that in the dim light seemed as level as the sea. Like the sea, too, it bore on its breast a ship, like a gigantic monitor with a sharp bow, cutting her way from north to south; such a ship as man never yet has seen—two miles long, with three or four hundred feet free-board, lonely, silent, mastless, without lights, a derelict of the earth.

"We are nearly there, Fib, my boy," said Tarvin, drawing rein, and scanning the monstrous thing by the starlight. "We'll get as close as we can, and then wait for the daylight before going aboard."

They descended the slope, which was covered with sharp stones and sleeping goats. Then the road turned sharply to the left, and began to run parallel to the ship. Tarvin urged Fibby into a more direct path, and the good horse blundered piteously across the scrub-covered ground, cut up and channeled by the rains into a network of six-foot ravines and gulches.

Here he gave out with a despairing grunt. Tarvin took pity on him, and, fastening him to a tree, bade him think of his sins till breakfast-time, and dropped from his back into a dry and dusty water-hole. Ten steps further, and the scrub was all about him, whipping him across the brows, hooking thorns into his jacket, and looping roots in front of his knees as he pushed on up an ever-steepening incline.

At last Tarvin was crawling on his hands and knees, grimed from head to foot, and

hardly to be distinguished from the wild pigs that passed like slate-colored shadows through the tangle of the thickets on their way to their rest. Too absorbed to hear them grunt, he pulled and screwed himself up the slope, tugging at the roots as though he would rend the Naulahka from the bowels of the earth, and swearing piously at every step. When he stopped to wipe the sweat from his face, he found, more by touch than by eye, that he knelt at the foot of a wall that ran up into the stars. Fibby, from the tangle below, was neighing dolefully.

"You're not hurt, Fibby," he gasped, spitting out some fragments of dry grass; "you are n't on in this scene. Nobody's asking *you* to fly to-night," he said, looking hopelessly up at the wall again, and whistling softly in response to an owl's hooting overhead.

He began to pick his way between the foot of the wall and the scrub that grew up to it, pressing one hand against the huge cut stones, and holding the other before his face. A fig-seed had found foothold between two of the gigantic slabs, and, undisturbed through the centuries, had grown into an arrogant, gnarled tree, that writhed between the fissures and heaved the stonework apart. Tarvin considered for a while whether he could climb into the crook of the lowest branch, then moved on a few steps, and found the wall rent from top to bottom through the twenty feet of its thickness, allowing passage for the head of an army.

"Like them, exactly like them!" he mused. "I might have expected it. To build a wall sixty feet high, and put an eighty-foot hole in it! The Naulahka must be lying out on a bush, or a child's playing with it, and—I can't get it!"

He plunged through the gap, and found himself amid scattered pillars, slabs of stone, broken lintels, and tumbled tombs, and heard a low, thick hiss almost under his riding-boots. No man born of woman needs to be instructed in the voice of the serpent.

Tarvin jumped, and stayed still. Fibby's neigh came faintly now. The dawn wind blew through the gap in the wall, and Tarvin wiped his forehead with a deep sigh of relief. He would do no more till the light came. This was the hour to eat and drink; also to stand very still, because of that voice from the ground.

He pulled food and a flask from his pocket, and, staring before him in every direction, ate hungrily. The loom of the night lifted a little, and he could see the outline of some great building a few yards away. Beyond this were other shadows, faint as the visions in a dream—the shadows of yet more temples and lines of houses; the wind, blowing among them, brought back a rustle of tossing hedges.

The shadows grew more distinct: he could see that he was standing with his face to some decayed tomb. Then his jaw fell, for, without warning or presage, the red dawn shot up behind him, and there leaped out of the night the city of the dead. Tall-built, sharp-domed palaces, flushing to the color of blood, revealed the horror of their emptiness, and glared at the day that pierced them through and through.

The wind passed singing down the empty streets, and, finding none to answer, returned, chasing before it a muttering cloud of dust, which presently whirled itself into a little cyclone-funnel, and laid down with a sigh.

A screen of fretted marble lay on the dry grass, where it had fallen from some window above, and a gecko crawled over it to sun himself. Already the dawn flush had passed. The hot light was everywhere, and a kite had poised himself in the parched blue sky. The day, new-born, might have been as old as the city. It seemed to Tarvin that he and it were standing still to hear the centuries race by on the wings of the purposeless dust.

As he took his first step into the streets, a peacock stepped from the threshold of a lofty red house, and spread his tail in the splendor of the sun. Tarvin halted, and with perfect gravity took off his hat to the royal bird, where it blazed against the sculptures on the wall, the sole living thing in sight.

The silence of the place and the insolent nakedness of the empty ways lay on him like a dead weight. For a long time he did not care to whistle, but rambled aimlessly from one wall to another, looking at the gigantic reservoirs, dry and neglected, the hollow guard-houses that studded the battlements, the time-riven arches that spanned the streets, and, above all, the carven tower with a shattered roof that sprang a hundred and fifty feet into the air, for a sign to the country-side that the royal city of Gunnaur was not dead, but would one day hum with men.

It was from this tower, incrusting with figures in high relief of beast and man, that Tarvin, after a heavy climb, looked out on the vast sleeping land in the midst of which the dead city lay. He saw the road by which he had come in the night, dipping and reappearing again over thirty miles of country, saw the white poppy-fields, the dull-brown scrub, and the unending plain to the northward, cut by the shining line of the rail. From his airy perch he peered forth as a man peers from a crow's-nest at sea; for, once down there below in the city, all view was cut off by the battlements that rose like bulwarks. On the side nearest to the railroad, sloping causeways, paved with stone, ran down to the plain under many gates, as the gangway of a ship when it is let down, and

through the gaps in the walls—time and the trees had torn their way to and fro—there was nothing to be seen except the horizon, which might have been the deep sea.

He thought of Fibby waiting in the scrub for his breakfast, and made haste to descend to the streets again. Remembering the essentials of his talk with Estes as to the position of the Cow's Mouth, he passed up a side-lane, disturbing the squirrels and monkeys that had taken up their quarters in the cool dark of the rows of empty houses. The last house ended in a heap of ruins among a tangle of mimosa and tall grass, through which ran a narrow foot-track.

Tarvin marked the house as the first actual ruin he had seen. His complaint against all the others, the temples and the palaces, was that they were not ruined, but dead—empty, swept, and garnished, with the seven devils of loneliness in riotous possession. In time—in a few thousand years perhaps—the city would crumble away. He was distinctly glad that one house at least had set the example.

The path dropped beneath his feet on a shelf of solid rock that curved over like the edge of a waterfall. Tarvin took only one step, and fell, for the rock was worn into deep gutters, smoother than ice, by the naked feet of millions who had trodden that way for no man knew how many years. When he rose he heard a malignant chuckle, half suppressed, which ended in a choking cough, ceased, and broke out anew. Tarvin registered an oath to find that scoff when he had found the necklace, and looked to his foothold more carefully. At this point it seemed that the Cow's Mouth must be some sort of disused quarry fringed to the lips with rank vegetation.

All sight of what lay below him was blocked by the thick foliage of trees that leaned forward, bowing their heads together as night-watchers huddle over a corpse. Once upon a time there had been rude steps leading down the almost sheer descent, but the naked feet had worn them to glassy knobs and lumps, and blown dust had made a thin soil in their chinks. Tarvin looked long and angrily, because the laugh came from the bottom of this track, and then, digging his heel into the mold, began to let himself down step by step, steadying himself by the tufts of grass. Before he had realized it, he was out of reach of the sun, and neck-deep in tall grass. Still there was a sort of pathway under his feet, down the almost perpendicular side. He gripped the grass, and went on. The earth beneath his elbows grew moist, and the rock where it cropped out showed rotten with moisture and coated with moss. The air grew cold and damp. Another plunge downward revealed to him what the

trees were guarding, as he drew breath on a narrow stone ledge. They sprung from the masonry round the sides of a square tank of water so stagnant that it had corrupted past corruption, and lay dull-blue under the blackness of the trees. The drought of summer had shrunk it, and a bank of dried mud ran round its sides. The head of a sunken stone pillar, carved with monstrous and obscene gods, reared itself from the water like the head of a tortoise swimming to land. The birds moved in the sunlit branches of the trees far overhead. Little twigs and berries dropped into the water, and the noise of their fall echoed from side to side of the tank that received no sunlight.

The chuckle that had so annoyed Tarvin broke out again as he listened. This time it was behind him, and, wheeling sharply, he saw that it came from a thin stream of water that spouted fitfully from the rudely carved head of a cow, and dripped along a stone spout into the heavy blue pool. Behind that spout the moss-grown rock rose sheer. This, then, was the Cow's Mouth.

The tank lay at the bottom of a shaft, and the one way down to it was that by which Tarvin had come—a path that led from the sunlight to the chill and mold of a vault.

"Well, this is kind of the King, anyhow," he said, pacing the ledge cautiously, for it was almost as slippery as the pathway on the rocks. "Now, what's the use of this?" he continued, returning. The ledge ran only round one side of the tank, and, unless he trusted to the mud-banks on the other three, there was no hope of continuing his exploration further. The Cow's Mouth chuckled again, as a fresh jet of water forced its way through the formless jaws.

"Oh, dry up!" he muttered impatiently, staring through the half light that veiled all.

He dropped a piece of rock on the mud under the lip of the ledge, then tested it with a cautious foot, found that it bore, and decided to walk round the tank. As there were more trees to the right of the ledge than to the left, he stepped off on the mud from the right, holding cautiously to the branches and the tufts of grass in case of any false step.

When the tank was first made its rock walls had been perfectly perpendicular, but time and weather and the war of the tree roots had broken and scarred the stone in a thousand places, giving a scant foothold here and there.

Tarvin crept along the right side of the tank, resolved, whatever might come, to go round it. The gloom deepened as he came directly under the largest fig-tree, throwing a thousand arms across the water, and buttressing the rock with snake-like roots as thick as a man's body. Here, sitting on a bole, he rested and looked at

the ledge. The sun, shooting down the path that he had trampled through the tall grass, threw one patch of light on the discolored marble of the ledge and on the blunt muzzle of the cow's head; but where Tarvin rested under the fig-tree there was darkness, and an intolerable scent of musk. The blue water was not inviting to watch; he turned his face inward to the rock and the trees, and, looking up, caught the emerald-green of a parrot's wing moving among the upper branches. Never in his life had Tarvin so acutely desired the blessed sunshine. He was cold and damp, and conscious that a gentle breeze was blowing in his face from between the snaky tree roots.

It was the sense of space more than actual sight that told him that there was a passage before him shrouded by the roots on which he sat, and it was his racial instinct of curiosity rather than any love of adventure that led him to throw himself at the darkness, which parted before and closed behind him. He could feel that his feet were treading on cut stone overlaid with a thin layer of dried mud, and, extending his arms, found masonry on each side. Then he lighted a match, and congratulated himself that his ignorance of cows' mouths had not led him to bring a lantern with him. The first match flickered in the draft and went out, and before the flame had died he heard a sound in front of him like the shivering backward draw of a wave on a pebbly beach. The noise was not inspiring, but Tarvin pressed on for a few steps, looking back to see that the dull glimmer of the outer day was still behind him, and lighted another match, guarding it with his hands. At his next step he shuddered from head to foot. His heel had crashed through a skull on the ground.

The match showed him that he had quitted the passage, and was standing in a black space of unknown dimensions. He fancied that he saw the outline of a pillar, or rows of pillars, flickering drunkenly in the gloom, and was all too sure that the ground beneath him was strewn with bones. Then he became aware of pale emerald eyes watching him fixedly, and perceived that there was deep breathing in the place other than his own. He flung the match down, the eyes retreated, there was a wild rattle and crash in the darkness, a howl that might have been bestial or human, and Tarvin, panting between the tree roots, swung himself to the left, and fled back over the mud-banks to the ledge, where he stood, his back to the Cow's Mouth and his revolver in his hand.

In that moment of waiting for what might emerge from the hole in the side of the tank Tarvin tasted all the agonies of pure physical terror. Then he noted with the tail of his eye that a length of mud-bank to his left—half the

mud-bank, in fact — was moving slowly into the water. It floated slowly across the tank, a long welt of filth and slime. Nothing came out of the hole between the fig-tree roots, but the mud-bank grounded under the ledge almost at Tarvin's feet, and opened horny eyelids, heavy with green slime.

The Western man is familiar with many strange things, but the alligator does not come within the common range of his experiences. A second time Tarvin moved from point to point without being able to explain the steps he took to that end. He found himself sitting in the sunshine at the head of the slippery path that led downward. His hands were full of the wholesome jungle-grass and the clean, dry dust. He could see the dead city about him, and he felt that it was home.

The Cow's Mouth chuckled and choked out of sight as it had chuckled since the making of the tank, and that was at the making of time. A man, old, crippled, and all but naked, came through the high grass leading a little kid, and calling mechanically from time to time, "*Do, bhai! Do!*" ("Come, brother! Come!") Tarvin marveled first at his appearance on earth at all, and next that he could so unconcernedly descend the path to the darkness and the horror below. He did not know that the sacred crocodile of the Cow's Mouth was waiting for his morning meal, as he had waited in the days when Gunnaur was peopled, and its queens never dreamed of death.

XIII.

FIBBY and Tarvin ate their breakfast together, half an hour later, in the blotched shadows of the scrub below the wall. The horse buried his nose into his provender, and said nothing. The man was equally silent. Once or twice he rose to his feet, scanned the irregular line of wall and bastion, and shook his head. He had no desire to return there. As the sun grew fiercer he found a resting-place in the heart of a circle of thorn, tucked the saddle under his head, and lay down to sleep. Fibby, rolling luxuriously, followed his master's example. The two took their rest while the air quivered with heat and the hum of insects, and the browsing goats clicked and pattered through the water-channels.

The shadow of the Tower of Glory lengthened, fell across the walls, and ran far across the plain; the kites began to drop from the sky by twos and threes; and naked children, calling one to another, collected the goats and drove them to the smoky villages before Tarvin roused himself for the homeward journey.

He halted Fibby once for a last look at Gunnaur as they reached the rising ground.

The sunlight had left the walls, and they ran black against the misty levels and the turquoise-blue of the twilight. Fires twinkled from a score of puts about the base of the city, but along the ridge of the desolation itself there was no light.

"Mum's the word, Fibby," said Tarvin, picking up his reins. "We don't think well of this picnic, and we won't mention it at Rhatore."

He chirruped, and Fibby went home as swiftly as he could lay hoof to stone, only once suggesting refreshment. Tarvin said nothing till the end of the long ride, when he heaved a deep sigh of relief as he dismounted in the fresh sunlight of the morning.

Sitting in his room, it seemed to him a waste of a most precious opportunity that he had not manufactured a torch in Gunnaur and thoroughly explored the passage. But the memory of the green eyes and the smell of musk came back to him, and he shivered. The thing was not to be done. Never again, for any consideration under the wholesome light of the sun, would he, who feared nothing, set foot in the Cow's Mouth.

It was his pride that he knew when he had had enough. He had had enough of the Cow's Mouth; and the only thing for which he still wished in connection with it was to express his mind about it to the Maharajah. Unhappily, this was impossible. That idle monarch, who, he now saw plainly, had sent him there either in a mood of luxurious sportiveness or to throw him off the scent of the necklace, remained the only man from whom he could look for final victory. It was not to the Maharajah that he could afford to say all that he thought.

Fortunately the Maharajah was too much entertained by the work which Tarvin immediately instituted on the Amet River to inquire particularly whether his young friend had sought the Naulahka at the Gye Mukh. Tarvin had sought an audience with the King the morning after his return from that black spot, and, with the face of a man who had never known fear and who lacks the measure of disappointments, gaily demanded the fulfilment of the King's promise. Having failed in one direction on a large scale, he laid the first brick on the walls of a new structure without delay, as the people of Topaz had begun to build their town anew the morning after the fire. His experience at the Gye Mukh only sharpened his determination, adding to it a grim willingness to get even with the man who had sent him there.

The Maharajah, who felt in especial need of amusement that morning, was very ready to make good his promise, and ordered that the long man who played pachisi should be granted all the men he could use. With the

energy of disgust, and with a hot memory of the least assured and comfortable moments of his life burning in his breast, Tarvin flung himself on the turning of the river and the building of his dam. It was necessary, it seemed, in the land upon which he had fallen, to raise a dust to hide one's ends. He would raise a dust, and it should be on the same scale as the catastrophe which he had just encountered — thorough, business-like, uncompromising.

He raised it, in fact, in a stupendous cloud. Since the state was founded no one had seen anything like it. The Maharajah lent him all the convict labor of his jails, and Tarvin marched the little host of leg-ironed *kaidies* into camp at a point five miles beyond the city walls, and solemnly drew up his plans for the futile damming of the barren Amet. His early training as a civil engineer helped him to lay out a reasonable plan of operations, and to give a semblance of reality to his work. His notion was to back up the river by means of a dam at a point where it swept around a long curve, and to send it straight across the plain by excavating a deep bed for it. When this was completed the present bed of the river would lie bare for several miles, and if there were any gold there, as Tarvin said to himself, then would be the time to pick it up. Meanwhile his operations vastly entertained the King, who rode out every morning and watched him directing his small army for an hour or more. The marchings and countermarchings of the mob of convicts with baskets, hoes, shovels, and pannier-laden donkeys, the prodigal blasting of rocks, and the general bustle and confusion, drew the applause of the King, for whom Tarvin always reserved his best blasts. This struck him as only fair, as the King was paying for the powder, and, indeed, for the entire entertainment.

Among the unpleasant necessities of his position was the need of giving daily to Colonel Nolan, to the King, and to all the drummers at the rest-house, whenever they might choose to ask him, his reasons for damming the Amet. The great Indian Government itself also presently demanded his reasons, in writing, for damming the Amet; Colonel Nolan's reasons, in writing, for allowing the Amet to be dammed; and the King's reasons for allowing anybody but a duly authorized agent of the Government to dam the Amet. This was accompanied by a request for further information. To these inquiries Tarvin, for his part, returned an evasive answer, and felt that he was qualifying himself for his political career at home. Colonel Nolan explained officially to his superiors that the convicts were employed in remunerative labor, and, unofficially, that the Maharajah had been so phenomenally good for some time past (be-

ing kept amused by this American stranger), that it would be a thousand pities to interrupt the operations. Colonel Nolan was impressed by the fact that Tarvin was the Hon. Nicholas Tarvin, and a member of the legislature of one of the United States.

The Government, knowing something of the irrepressible race who stride booted into the council-halls of kings, and demand concessions for oil-boring from Arracan to the Peshin, said no more, but asked to be supplied with information from time to time as to the progress of the stranger's work. When Tarvin heard this he sympathized with the Indian Government. He understood this thirst for information; he wanted some himself as to the present whereabouts of the Naulahka; also touching the time it would take Kate to find out that she wanted him more than the cure of any misery whatever.

At least twice a week, in fancy, he gave up the Naulahka definitely, returned to Topaz, and resumed the business of a real-estate and insurance agent. He drew a long breath after each of these decisions, with the satisfying recollection that there was still one spot on the earth's surface where a man might come directly at his desires if he possessed the sand and the hustle; where he could walk a straight path to his ambition; and where he did not by preference turn five corners to reach an object a block away.

Sometimes, as he grilled patiently in the river-bed under the blighting rays of the Indian sun, he would heretically blaspheme the Naulahka, refusing to believe in its existence, and persuading himself that it was as grotesque a lie as the King's parody of a civilized government, or as Dhunpat Rai's helpful surgery. Yet from a hundred sources he heard of the existence of that splendor, only never in reply to a direct question.

Dhunpat Rai, in particular (once weak enough to complain of the new lady doctor's "excessive zeal and surplusage administration"), had given him an account that made his mouth water. But Dhunpat Rai had not seen the necklace since the crowning of the present King, fifteen years before. The very convicts on the works, squabbling over the distribution of food, spoke of millet as being as costly as the Naulahka. Twice the Maharaj Kunwar, babbling vaingloriously to his big friend of what he would do when he came to the throne, concluded his confidences with, "And then I shall wear the Naulahka in my turban all day long."

But when Tarvin asked him where that precious necklace lived, the Maharaj Kunwar shook his head, answering sweetly, "I do not know."

The infernal thing seemed to be a myth, a

word, a proverb—anything rather than the finest necklace in the world. In the intervals of blasting and excavation he would make futile attempts to come upon its track. He took the city ward by ward, and explored every temple in each; he rode, under pretense of archæological study, to the outlying forts and ruined palaces that lay beyond the city in the desert, and roved restlessly through the mausoleums that held the ashes of the dead kings of Rhatore. He told himself a hundred times that he knew each quest to be hopeless; but he needed the consolation of persistent search. And the search was always vain.

Tarvin fought his impatience when he rode abroad with the Maharajah. At the palace, which he visited at least once a day under pretense of talking about the dam, he devoted himself more sedulously than ever to pachisi. It pleased the Maharajah in those days to remove himself from the white marble pavilion in the orange-garden, where he usually spent the spring months, to Sitabhai's wing of the red-stone palace, and to sit in the courtyard watching trained parrots firing little cannons, and witnessing combats between fighting quail or great gray apes dressed in imitation of English officers. When Colonel Nolan appeared the apes were hastily dismissed; but Tarvin was allowed to watch the play throughout, when he was not engaged on the dam. He was forced to writhe in inaction and in wonder about his necklace, while these childish games went forward; but he constantly kept the corner of an eye upon the movements of the Maharaj Kunwar. There, at least, his wit could serve some one.

The Maharajah had given strict orders that the child should obey all Kate's instructions. Even his heavy eyes noted an improvement in the health of the little one, and Tarvin was careful that he should know that the credit belonged to Kate alone. With impish perversity the young Prince, who had never received an order in his life before, learned to find joy in disobedience, and devoted his wits, his escort, and his barouche to gambling in the wing of the palace belonging to Sitabhai. There he found gray-headed flatterers by the score, who abased themselves before him, and told him what manner of king he should be in the years to come. There also were pretty dancing-girls, who sang him songs, and would have corrupted his mind but that it was too young to receive corruption. There were, besides, apes and peacocks and jugglers,—new ones every day,—together with dancers on the slack rope, and wonderful packing-cases from Calcutta, out of which he was allowed to choose ivory-handled pistols and little gold-hilted swords with seed-pearls set in a groove along the middle, and running musically up and down as he waved

the blade round his head. Finally, the sacrifice of a goat in an opal and ivory temple in the heart of the women's quarters, which he might watch, allured him that way. Against these enticements Kate, moody, grave, distracted, her eyes full of the miseries on which it was her daily lot to look, and her heart torn with the curelessness of it all, could offer only little childish games in the missionary's drawing-room. The heir apparent to the throne did not care for leap-frog, which he deemed in the highest degree undignified; nor yet for puss-in-the-corner, which seemed to him overactive; nor for tennis, which he understood was played by his brother princes, but which to him appeared no part of a Rajput's education. Sometimes, when he was tired (and on rare occasions when he escaped to Sitabhai's wing it was observable that he returned very tired indeed), he would listen long and intently to the stories of battle and siege which Kate read to him, and would scandalize her at the end of the tale by announcing, with flashing eye:

"When I am king I will make my army do *all* those things."

It was not in Kate's nature—she would have thought it in the highest degree wrong—to refrain from some little attempt at religious instruction. But here the child retreated into the stolidity of the East, and only said:

"All these things are very good for you, Kate, but all my gods are very good for me; and if my father knew, he would be angry."

"And what *do* you worship?" asked Kate, pitying the young pagan from the bottom of her heart.

"My sword and my horse," answered the Maharaj Kunwar; and he half drew the jeweled saber that was his inseparable companion, returning it with a resolute clank that closed the discussion.

But it was impossible, he discovered, to evade the long man Tarvin as he evaded Kate. He resented being called "bub," nor did he approve of "little man." But Tarvin could draw the word "Prince" with a quiet deference that made the young Rajput almost suspect himself the subject of a jest. And yet Tarvin Sahib treated him as a man, and allowed him, under due precautions, to handle his mighty "gun," which was not a gun, but a pistol. And once, when the Prince had coaxed the keeper of the horse into allowing him to bestride an unmanageable mount, Tarvin, riding up, had picked him out of the depths of the velvet saddle, set him on his own saddle-bow, and, in the same cloud of dust, shown him how, in his own country, they laid the reins on one side or the other of the neck of their cattle-ponies to guide them in pursuit of a steer broken from the herd.

The trick of being lifted from his saddle, ap-

pealing to the "circus" latent in the boy breast even of an Eastern prince, struck the Maharaj as so amusing that he insisted on exhibiting it before Kate; and as Tarvin was a necessary figure in the performance, he allured him into helping him with it one day before the house of the missionary. Mr. and Mrs. Estes came out upon the veranda with Kate and watched the exhibition, and the missionary pursued it with applause and requests for a repetition, which, having been duly given, Mrs. Estes asked Tarvin if he would not stay to dinner with them since he was there. Tarvin glanced doubtfully at Kate for permission, and, by a process of reasoning best known to lovers, construed the veiling of her eyes and the turning of her head into assent.

After dinner, as they sat on the veranda in the starlight, "Do you really mind?" he asked.

"What?" asked she, lifting her sober eyes and letting them fall upon him.

"My seeing you sometimes. I know you don't like it; but it will help me to look after you. You must see by this time that you need looking after."

"Oh, no."

"Thank you," said Tarvin, almost humbly.

"I mean I don't need looking after."

"But you don't dislike it?"

"It's good of you," she said impartially.

"Well, then, it will be bad of you not to like it."

Kate had to smile. "I guess I like it," she replied.

"And you will let me come once in a while? You can't think what the rest-house is. Those drummers will kill me yet. And the coolies at the dam are not in my set."

"Well, since you're here. But you ought not to be here. Do me a real kindness, and go away, Nick."

"Give me an easier one."

"But *why* are you here? You can't show any rational reason."

"Yes; that's what the British Government says. But I brought my reason along."

He confessed his longing for something homely and natural and American after a day's work under a heathen and raging sun; and when he put it in this light, Kate responded on another side. She had been brought up with a sense of responsibility for making young men feel at home; and he certainly felt at home when she was able to produce, two or three evenings later, a Topaz paper sent her by her father. Tarvin pounced on it, and turned the flimsy four pages inside out, and then back again.

He smacked his lips. "Oh, good, good, good!" he murmured relishingly. "Don't the advertisements look nice? What's the matter with Topaz?" cried he, holding the sheet from

him at arm's-length, and gazing ravenously up and down its columns. "Oh, *she's* all right." The cooing, musical singsong in which he uttered this consecrated phrase was worth going a long way to hear. "Say, we're coming on, are n't we? We're not lagging nor loafing, nor fooling our time away, if we *have n't* got the Three C.'s yet. We're keeping up with the procession. Hi-yi! look at the 'Rustler Root-lets'—just about a stickful! Why, the poor old worm-eaten town is going sound, sound asleep in her old age, is n't she? Think of taking a railroad there! Listen to this:

"Milo C. Lambert, the owner of 'Lambert's Last Ditch,' has a car-load of good ore on the dump, but, like all the rest of us, don't find it pays to ship without a railroad line nearer than fifteen miles. Milo says Colorado won't be good enough for him after he gets his ore away.

"I should think not. Come to Topaz, Milo! And this:

"When the Three C.'s comes into the city in the fall we sha'n't be hearing this talk about hard times. Meantime it's an injustice to the town, which all honest citizens should resent and do their best to put down, to speak of Rustler as taking a back seat to any town of its age in the State. As a matter of fact, Rustler was never more prosperous. With mines which produced last year ore valued at a total of \$1,200,000, with six churches of different denominations, with a young but prosperous and growing academy which is destined to take a front rank among American schools, with a record of new buildings erected during the past year equal if not superior to any town in the mountains, and with a population of lively and determined business men, Rustler bids fair in the coming year to be worthy of her name.

"Who said 'afraid'? We're not hurt. Hear us whistle. But I'm sorry Heckler let that into his correspondence," he added, with a momentary frown. "Some of our Topaz citizens might miss the fun of it, and go over to Rustler to wait for the Three C.'s. Coming in the fall, is it? Oh, dear! Oh, dear, dear, dear! This is the way they amuse themselves while they dangle their legs over Big Chief Mountain and wait for it:

"Our merchants have responded to the recent good feeling which has pervaded the town since word came that President Mutrie, on his return to Denver, was favorably considering the claims of Rustler. Robbins has his front windows prettily decorated and filled with fancy articles. His store seems to be the most popular for the youngsters who have a nickel or two to spend.

"I should murmur! Won't you like to see the Three C.'s come sailing into Topaz one of these fine mornings, little girl?" asked Tarvin,

suddenly, as he seated himself on the sofa beside her, and opened out the paper so that she could look over his shoulder.

"Would you like it, Nick?"

"Would I!"

"Then, of course, I should. But I think you will be better off if it does n't. It will make you too rich. See father."

"Well, I'd put on the brakes if I found myself getting real rich. I'll stop just after I've passed the Genteel Poverty Station. Is n't it good to see the old heading again—Heckler's name as large as life just under 'oldest paper in Divide County,' and Heckler's fist sticking out all over a rousing editorial on the prospects of the town? Homelike, is n't it? He's got two columns of new advertising; that shows what the town's doing. And look at the good old 'ads.' from the Eastern agencies. How they take you back! I never expected to thank Heaven for a castoria advertisement; did you, Kate? But I swear it makes me feel good all over. I'll read the patent inside if you say much."

Kate smiled. The paper gave her a little pang of homesickness too. She had her own feeling for Topaz; but what reached her through the "Telegram's" lively pages was the picture of her mother sitting in her kitchen in the long afternoons (she had sat in the kitchen so long in the poor and wandering days of the family that she did it now by preference), gazing sadly out at white-topped Big Chief, and wondering what her daughter was doing at that hour. Kate remembered well that afternoon hour in the kitchen when the work was done. She recalled from the section-house days the superannuated rocker, once a parlor chair, which her mother had hung with skins and told off for kitchen service. Kate remembered with starting tears that her mother had always wanted her to sit in it, and how good it had been to see from her own hassock next the oven the little mother swallowed up in its depths. She heard the cat purring under the stove, and the kettle singing; the clock ticked in her ear, and the cracks between the boards in the floor of the hastily built section-house blew the cold prairie air against her heels.

She gazed over Tarvin's shoulder at the two cuts of Topaz which appeared in every issue of the "Telegram,"—the one representing the town in its first year, the other the town of today,—and a lump rose in her throat.

"Quite a difference, is n't there?" said Tarvin, following her eye. "Do you remember where your father's tent used to stand, and the old section-house, just here by the river?" He pointed, and Kate nodded without speaking. "Those were good days, were n't they? Your father was n't as rich as he is now, and

neither was I; but we were all mighty happy together."

Kate's thought drifted back to that time, and called up other visions of her mother expending her slight frame in many forms of hard work. The memory of the little characteristic motion with which she would shield with raised hand the worn young old face when she would be broiling above an open fire, or frying doughnuts, or lifting the stove-lid, forced her to gulp down the tears. The simple picture was too clear, even to the light of the fire on the face, and the pink light shining through the frail hand.

"Hello!" said Tarvin, casting his eye up and down the columns, "they've had to put another team on to keep the streets clean. We had one. Heckler don't forget the climate either. And they are doing well at the Mesa House. That's a good sign. The tourists will all have to stop over at Topaz when the new line comes through, and we have the right hotel. Some towns might think we had a little tourist traffic now. Here's Loomis dining fifty at the Mesa the other day—through express. They've formed a new syndicate to work the Hot Springs. Do you know, I should n't wonder if they made a town down there. Heckler's right. It *will* help Topaz. We don't mind a town that near. It makes a suburb of it."

He marked his sense of the concession implied in letting him stay that evening by going early; but he did not go so early on the following evening, and as he showed no inclination to broach forbidden subjects, Kate found herself glad to have him there, and it became a habit of his to drop in, in the evenings, and to join the group that gathered, with open doors and windows, about the family lamp. In the happiness of seeing visible effects from her labors blossoming under her eyes, Kate regarded his presence less and less. Sometimes she would let him draw her out upon the veranda, under the sumptuous Indian night—nights when the heat-lightning played like a drawn sword on the horizon, and the heavens hovered near the earth, and the earth was very still. But commonly they sat within, with the missionary and his wife, talking of Topaz, of the hospital, of the Maharaj Kunwar, of the dam, and sometimes of the Estes children at Bangor. For the most part, however, when the talk was among the group, it fell upon the infinitesimal gossip of a sequestered life, to the irritation and misery of Tarvin.

When the conversation lagged in these deeps he would fetch up violently with a challenge to Estes on the subject of the tariff or silver legislation, and after that the talk was at least lively. Tarvin was, by his training, largely a newspaper-educated man. But he had also

been taught at first hand by life itself, and by the habit of making his own history; and he used the hairy fist of horse-sense in dealing with the theories of newspaper politics and the systems of the schools.

Argument had no allurements for him, however; it was with Kate that he talked when he could, and oftenest, of late, of the hospital, since her progress there had begun to encourage her. She yielded at last to his entreaties to be allowed to see this paragon, and to look for himself upon the reforms she had wrought.

Matters had greatly improved since the days of the lunatic and the "much-esteemed woman," but only Kate knew how much remained to be done. The hospital was at least clean and sweet if she inspected it every day, and the people in their fashion were grateful for kinder tending and more skilful treatment than they had hitherto dreamed of. Upon each cure a rumor went abroad through the country-side of a new power in the land, and other patients came; or the convalescent herself would bring back a sister, a child, or a mother with absolute faith in the power of the White Fairy to make all whole. They could not know all the help that Kate brought in the train of her quiet movements, but for what they knew they blessed her as they lay. Her new energy swept even Dhunpat Rai along the path of reform. He became curious in the limewashing of stonework, the disinfecting of wards, the proper airing of bed-linen, and even the destruction by fire of the bedsteads, once his perquisite, on which smallpox patients had died. Native-like, he worked best for a woman with the knowledge that there was an energetic white man in the background. Tarvin's visit, and a few cheery words addressed to him by that capable outsider, supplied him with this knowledge.

Tarvin could not understand the uncouth talk of the out-patients, and did not visit the women's wards; but he saw enough to congratulate Kate unreservedly. She smiled contentedly. Mrs. Estes was sympathetic, but in no way enthusiastic; and it was good to be praised by Nick, who had found so much to blame in her project.

"It's clean and it's wholesome, little girl," he said, peering and sniffing; "and you've done miracles with these jellyfish. If you'd been on the opposition ticket instead of your father I should n't be a member of the legislature."

Kate never talked to him about that large part of her work which lay among the women of the Maharajah's palace. Little by little she learned her way about such portions of the pile as she was permitted to traverse. From the first she had understood that the palace

was ruled by one Queen, of whom the women spoke under their breath, and whose lightest word, conveyed by the mouth of a grinning child, set the packed mazes humming. Once only had she seen this Queen, glimmering like a tiger-beetle among a pile of *kinco* cushions—a lithe, black-haired young girl, it seemed, with a voice as soft as running water at night, and with eyes that had no shadow of fear in them. She turned lazily, the jewels clinking on ankle, arm, and bosom, and looked at Kate for a long time without speaking.

"I have sent that I may see you," she said at last. "You have come here across the water to help these cattle?"

Kate nodded, every instinct in her revolting at the silver-tongued splendor at her feet.

"You are not married?" The Queen put her hands behind her head and looked at the painted peacocks on the ceiling.

Kate did not reply, but her heart was hot.

"Is there any sickness here?" she asked at last sharply. "I have much to do."

"There is none, unless it may be that you yourself are sick. There are those who sicken without knowing it."

The eyes turned to meet Kate's, which were blazing with indignation. This woman, lapped in idleness, had struck at the life of the Maharaj Kunwar; and the horror of it was that she was younger than herself.

"*Achcha*," said the Queen, still more slowly, watching her face. "If you hate me so, why do you not say so? You white people love truth."

Kate turned on her heel to leave the room. Sitabhai called her back for an instant, and, moved by some royal caprice, would have caressed her, but she fled indignant, and was careful never again to venture into that wing of the palace. None of the women there called for her services, and not once but several times, when she passed the mouth of the covered way that led to Sitabhai's apartments, she saw a little naked child flourishing a jeweled knife, and shouting round the headless carcass of a goat whose blood was flooding the white marble. "That," said the women, "is the gipsy's son. He learns to kill daily. A snake is a snake, and a gipsy is a gipsy, till they are dead."

There was no slaughter of goats, singing of songs, or twangling of musical instruments in the wing of the palace that made itself specially Kate's own. Here lived, forgotten by the Maharajah and mocked by Sitabhai's maidens, the mother of the Maharaj Kunwar. Sitabhai had taken from her—by the dark arts of the gipsies, so the Queen's adherents said; by her own beauty and knowledge in love, they sang in the other wing of the palace—all honor and consideration due to her as the Queen Mother.

There were scores of empty rooms where once there had been scores of waiting-women, and those who remained with the fallen Queen were forlorn and ill-favored. She herself was a middle-aged woman, by Eastern standards; that is to say, she had passed twenty-five, and had never been more than ordinarily comely.

Her eyes were dull with much weeping, and her mind was full of superstitions—fears for every hour of the night and the day, and vague terrors, bred of loneliness, that made her tremble at the sound of a footfall. In the years of her prosperity she had been accustomed to perfume herself, put on her jewels, and with braided hair await the Maharajah's coming. She would still call for her jewels, attire herself as of old, and wait amid the respectful silence of her attendants till the long night gave way to the dawn, and the dawn showed the furrows on her cheeks. Kate had seen one such vigil, and perhaps showed in her eyes the wonder that she could not repress, for the Queen Mother fawned on her timidly after the jewels had been put away, and begged her not to laugh.

"You do not understand, Miss Kate," she pleaded. "There is one custom in your country and another in ours; but still you are a woman, and you will know."

"But you know that no one will come," Kate said tenderly.

"Yes, I know; but—no, you are not a woman, only a fairy that has come across the water to help me and mine."

Here again Kate was baffled. Except in the message sent by the Maharaj Kunwar, the Queen Mother never referred to the danger that threatened her son's life. Again and again Kate had tried to lead up to the subject—to gain some hint, at least, of the nature of the plot.

"I know nothing," the Queen would reply. "Here behind the curtain no one knows anything. Miss Kate, if my own women lay dead out there in the sun at noon,"—she pointed downward through the tracery of her window to the flagged path below,—"*I should know nothing. Of what I said I know nothing; but surely it is allowed,*"—she lowered her voice to a whisper,—"*oh, surely it is allowed to a mother to bid another woman look to her son. He is so old now that he thinks himself a man, and wanders far, and so young that he thinks the world will do him no harm. Ahi! And he is so wise that he knows a thousand times more than I: he speaks English like an Englishman. How can I control him with my little learning and my very great love? I say to you, Be good to my son. That I can say aloud, and write it upon a wall, if need were. There is no harm in that. But if I said more, look you, the plaster between the stones be-*

neath me would gape to suck it in, and the wind would blow all my words across to the villages. I am a stranger here—a Rajputni from Kulu, a thousand thousand coss away. They bore me here in a litter to be married—in the dark they bore me for a month; and except that some of my women have told me, I should not know which way the home wind blows when it goes to Kulu. What can a strange cow do in the byre? May the gods witness."

"Ah, but tell me what you think?"

"I think nothing," the Queen would answer sullenly. "What have women to do with thinking? They love and they suffer. I have said all that I may say. Miss Kate, some day you will bear a little son. As you have been good to my son, so may the gods be good to yours when that time comes, and you know how the heart is full of love."

"If I am to protect him, I must know. You leave me in the dark."

"And I also am in the dark—and the darkness is full of danger."

TARVIN himself was much about the palace, not only because he perceived that it was there he might most hopefully keep his ear to the ground for news of the Naulahka, but because it enabled him to observe Kate's comings and goings, and with his hand ready for a rapid movement to his pistol-pocket.

His gaze followed her at these times, as at others, with the longing look of the lover; but he said nothing, and Kate was grateful to him. It was a time, as it seemed to him, to play the part of the Tarvin who had carried water for her long ago at the end of the section; it was a time to stand back, to watch, to guard, but not to trouble her.

The Maharaj Kunwar came often under his eye, and he was constantly inventing amusing things for him to do remote from Sitabhai's courtyard; but the boy would occasionally break away, and then it was Tarvin's task to go after him and make sure that he came to no harm. One afternoon when he had spent some time in coaxing the child away, and had finally resorted to force, much to the child's disgust, a twelve-foot balk of teak-wood, as he was passing out under an arch in process of repair, crashed down from the scaffolding just in front of Fibby's nose. The horse retired into the courtyard on his hind legs, and Tarvin heard the rustle of the women behind the shutters.

He reflected on the incurable slackness of these people, stopped to swear at the workmen crouched on the scaffolding in the hollow of the arch, and went on. They were no less careless about the dam,—it was in the blood, he supposed,—for the head man of a coolie-gang,

who must have crossed the Amet twenty times, showed him a new ford across a particularly inviting channel, which ended in a quicksand; and when Tarvin had flung himself clear, the gang spent half the day in hauling Fibby out with ropes. They could not even build a temporary bridge without leaving the boards loose, so that a horse's hoof found its way between; and the gangs seemed to make a point of letting bullock-carts run down the steep embankments into the small of Tarvin's back, when, at infrequent intervals, that happened to be turned.

Tarvin was filled with great respect for the British Government, which worked on these materials, and began to understand the mild-faced melancholy and decisive views of Lucien Estes about the native population, as well as to sympathize more keenly than ever with Kate.

This curious people were now, he learned with horror, to fill the cup of their follies by marrying the young Maharaj Kunwar to a three-year-old babe, brought from the Kulu hills, at vast expense, to be his bride. He sought out Kate at the missionary's, and found her quivering with indignation. She had just heard.

"It's like them to waste a wedding where it is n't wanted," said Tarvin, soothingly.

Since he saw Kate excited, it became his part to be calm.

"Don't worry your overworked head about it, Kate. You are trying to do too much, and you are feeling too much. You will break down before you know it, from sheer exhaustion of the chord of sympathy."

"Oh, no!" said Kate. "I feel quite strong enough for anything that may come. I must n't break down. Think of this marriage coming on. The Maharaj will need me more than ever. He has just told me that he won't get any sleep for three days and three nights while their priests are praying over him."

"Crazy! Why, it's a quicker way of killing him than Sitabhai's. Heavens! I dare n't think of it. Let's talk of something else. Any

papers from your father lately? This kind of thing makes Topaz taste sort of good."

She gave him a package received by the last post, and he fell silent as he ran his eye hastily over a copy of the "Telegram" six weeks old; but he seemed to find little comfort in it. His brows knitted.

"Pshaw!" he exclaimed with irritation, "this won't do!"

"What is it?"

"Heckler bluffing about the Three C.'s, and not doing it well. That is n't like Jim. He talks about it as a sure thing as hard as if he did n't believe in it, and had a private tip from somewhere that it was n't coming after all. I've no doubt he has. But he need n't give it away to Rustler like that. Let's look at the real-estate transfers. Ah! that tells the story," he exclaimed excitedly, as his eye rested on the record of the sale of a parcel of lots on G street. "Prices are going down—away, 'way down. The boys are caving. They're giving up the fight." He leaped up and marched about the room nervously. "Heavens! if I could only get word to them!"

"Why—what, Nick? What word do you want to send them?"

He pulled himself up instantly.

"To let them know that I believe in it," he said. "To get them to hold on."

"But suppose the road does n't come to Topaz, after all. How can you know, away off here in India?"

"Come to Topaz, little girl!" he shouted. "Come to Topaz! It's coming if I have to lay the rails!"

But the news about the temper of the town vexed and disconcerted him notwithstanding, and after he left Kate that night he sent a cable to Heckler, through Mrs. Mutrie, desiring her to forward the despatch from Denver, as if that were the originating office of the message.

HECKLER, TOPAZ.—*Take a brace, for God's sake! Got dead cinch on Three C.'s. Trust me, and boom like —.* TARVIN.

(To be continued.)

"I SAW THE CLOUDS AT MORNING'S HOUR."

I SAW the clouds at morning's hour
Toward the horizon swiftly throng;
A power impelled them, but a power
Invisible as it was strong.

And still they move, they will not stay,
But with one impulse and one speed
Serenely do they hold their way;
Their course is known, the path decreed.

And even with such an impulse move
These absent thoughts that now I bear;
Bright are they, for they are of love,
And fair they are, for thou art fair.

Langdon Elwyn Mitchell.

THE UNITED STATES FISH COMMISSION.

SOME OF ITS WORK.

THE discovery of America was quickly followed by marvelous stories of its fishery wealth, which attracted the covetous eyes of Europe, and made the Grand Bank a favorite resort for fishing-vessels nearly a century before the Pilgrims landed. Proving a veritable El Dorado during the strife and speculation then prevailing, it was mainly that source of industry which directed the early tide of immigration toward the rugged coasts now comprised within New England and the British provinces. Settlements were established to assist in the preparation of the catch, and those who sought political and religious freedom in the untried land were confident of at least this means of gaining sustenance. The industry developed rapidly under foreign hands, but its management has gradually shifted from the Old World to the New, leaving only the French in active competition at the present time.

From its favorable location, New England readily became the leader in this movement as regards the United States, but the fishery interests of this country have long since spread beyond those narrow limits. Important grounds stretch southward into the Gulf of Mexico, and northward, on the Pacific side, from San Diego to the icy belt. The large inland lakes and river systems constitute, moreover, a vast storehouse of resources from which is drawn a good percentage of the food-supply. No other country in the world has such varied and productive fisheries, and nowhere else has the fishing business been more actively carried on or more systematically promoted. It has kept pace with the rapid increase of population, and no pains have been spared to bring it to its present standing.

The phenomenal progress thus exhibited has been due, however, entirely to private enterprise, through which the industry has prospered after its own fashion and without restraint. It was, therefore, only natural that the insidious decay which threatens every enterprise in proportion as its growth is uncontrolled, should finally attack the fishing-grounds and spread to all localities where persistent efforts had prevailed. These grounds became depleted to a

greater or less extent in different places, the amount of injury done not being measurable by any precise standards. The reasons assigned were mainly avaricious or injudicious fishing, but other causes have tended toward the same result, and sometimes in a marked degree. For the first, however, it is scarcely just to lay the weight of blame upon the fishermen themselves. The conditions which surround their calling are peculiar, and they are gifted with at least the average ambition of the human race. With few exceptions, their fields of work are public grounds, which they can neither fence nor plant, nor can they give to them the benefits of individual protection. Why, therefore, should not each strive for the greatest gain, regardless of his neighbor or of his own distant future?

While the farmer makes provision for successive crops, the fisherman is almost wholly limited to those supplies which nature has contributed. A moderate amount of fishing may have no appreciable effect upon the grounds, or may even prove beneficial to them; but harm results as soon as the balance of life has been disturbed, or some constraint has been placed upon the habits of the fishes. Such occurrences have been common in the later history of this country, and have been the cause of wide-spread suffering.

How to protect and maintain the fisheries is, therefore, an important problem, deeply affecting the welfare of every civilized nation, but its solution has been long delayed through the imperfect means taken to consider it. It remained for the United States to introduce the first extensive measures for relief, founded upon a thoroughly rational and comprehensive basis, and thenceforward to take the lead in all such matters. This innovation required that the causes of the trouble be first determined by careful observations, in order that the remedies applied might be entirely appropriate and successful. At the beginning of the inquiry there was nothing to suggest the broad proportions which the present Fish Commission afterward assumed. A specific survey was proposed, which might have terminated within a year or two, had not the time been propitious for greater efforts, and the future welfare of the fisheries been confided to a master mind. Circumstances favored an expansion of the work, and led finally to the establishment of a new

branch of government, the benefits of which extend to every part of the country.

The inception of the commission resulted from certain depleted fisheries along the southern New England coast, with which the adjoining States found themselves incompetent to deal. Upon the assumption that the damage had occurred in navigable waters, the matter was taken in hand by Congress during the winter of 1870-71, and a bill was passed providing for a scientific study of the subject. It authorized the appointment, from among the civilian officers of the Government, of a commissioner of fish and fisheries, who should possess the requisite attainments and should serve without additional pay. His duties were to investigate the alleged decrease of fishes both on the sea-coast and in the great lakes, and to report the results to Congress, with such recommendations for relief as seemed advisable.

Professor Spencer F. Baird, then the assistant secretary of the Smithsonian Institution, was selected for this important post, and his administration of the same, continued for more than sixteen years upon a wise and liberal policy, has not only given to the many fishing interests greater unity and strength, but has assured them such prosperity for the future as lies within the power of human efforts. To accomplish so great a task required, however, that the scope and purpose of the commission be rapidly enlarged, with a corresponding increase in the personnel and in the duties of its director. The cause of decrease having been determined, it became essential to devise effective measures for preventing further loss, and for repairing, so far as possible, the damage already done. This led the commission into fish-culture and to a consideration of the ways and means of fishing, by which its scheme of work was rounded out, and thoroughly practical results were attained.

Professor Baird's strong personality was manifested in every branch of the commission, and his later years were almost wholly occupied in the promotion of its interests. But scientific investigations, for which he was best suited by training and inclination, received, however, the greater share of his attention, and bear most strongly the impress of his untiring energy and genius. The remarks which follow have reference chiefly to his favorite subject.

The greatest decrease among food-fishes had been reported from southern Massachusetts and Rhode Island, where, therefore, it was most appropriate that the explorations should begin. One of the most extensive sheets of water in this region is Vineyard Sound, the favorite resort for many fishes, and the common thoroughfare for all vessels passing

up and down the coast. On the east it reaches Monomoy, and on the west communicates directly with Buzzard's Bay and the waters off Rhode Island. Upon the mainland at its upper western end is a little fishing-village called Wood's Holl, a vantage-point for the entire area whose fisheries were in immediate distress. Here it was that, in June, 1871, Professor Baird began his investigations, aided by a small party of scientific men specially qualified to take up the different problems which the inquiry had suggested. Among its members were some of the most distinguished naturalists of the country, acting as volunteer assistants, and accepting the splendid opportunities for study as compensation for their services, a practice which has continued to the present time.

A small building on the lighthouse wharf in the little harbor was converted into a rude laboratory, and a floating establishment, comprising a sloop-yacht, a steam-launch, and several rowboats, was quickly brought together. This simple equipment furnished the means for a careful and comprehensive exploration, which was carried seaward as far as the stability of the little fleet permitted. It was a season of hard work and of important and enduring results. The fishermen and the dealers in fish were closely questioned regarding the methods and statistics of their trade; the gill-nets and fish-traps near at hand were visited every day; seines, dredges, and surface-nets were in constant use to gather materials bearing upon the aquatic life of the region; and observations were made upon the physical and chemical conditions of the sea, as to its temperature, density, and composition.

It had previously been the custom, both in this and in other countries, to consider the matter of decreasing fisheries through the conflicting testimony of interested persons. Professor Baird, however, was not satisfied to follow this example. The scientific methods of research which had insured the stability of his zoological work were, in his opinion, just as applicable to the present subject, even though the results desired were of a practical nature. The decrease, if one had actually occurred, might have been produced by injudicious practices, or it might have been the outcome of natural conditions, or, possibly, of both combined. In any case there were many facts requiring investigation. Had man been the agent of destruction? Was it due to his fishing through the spawning-season, to the use of large nets of fine texture, or to his lining the shores and passageways with fixed appliances of capture? If nature itself were responsible, was it caused by changes in physical conditions affecting the habitats of certain fishes,

DRAWN BY J. C. BEARD.

THE BAT-FISH.

ENGRAVED BY F. S. KING.

had the food upon the grounds become exhausted, or were new predaceous species exterminating the older and better-known kinds?

In carrying out this new policy, it was necessary to examine directly the different fishing-grounds and to determine their characteristics and the nature and relations of their inhabitants, as well as their conditions past and present; to study the growth and the habits of fishes, with special reference to their migrations, schooling, and spawning; to observe the influence of temperature, salinity, and other physical conditions upon their general welfare and upon their movements from place to place. It was also essential to consider with equal thoroughness all artificial constructions having a pernicious influence upon natural laws, such as the more destructive forms of fishing-apparatus and the barriers erected in watercourses.

During the second and third summers the

work was carried to the coast of Maine, with headquarters at Eastport and Portland. Thence the party returned southward to Noank, Connecticut, and to Wood's Holl for a second time. Salem and Halifax were visited in 1877, and Gloucester, Provincetown, and Newport during the three succeeding years. While the vessels of the commission were still unsuited for making long cruises, these annual changes were required in order to reach the different fishing-regions. The working-quarters were never elaborate affairs, but some convenient building near the water was hastily adapted to the purpose and furnished with only the simplest character of outfit. Pine tables were placed in front of each of the windows for the separate accommodation of the assistants, and the intervening walls were covered with open shelving for the books and specimens. The center of the room was occupied by

larger tables, and the aquariums were sandwiched in wherever the space permitted. Such was the customary arrangement of the laboratory proper, but the coarser work was usually provided for in a basement room or in a separate structure.

The daily occupations varied with the weather and with the tastes and qualifications of each assistant. Severe storms might keep them indoors, but it rarely happened that some field-work was not in progress. The party was practically divided into squads, changing more or less in composition from time to time, one charged with seining and other modes of fishing, another with the general collecting along the shore and in shallow water, while the more

During the first two years the Fish Commission dredging was done entirely by hand, and generally from a sail-boat or steam-launch. The outfit consisted of a small dredge with its coil of rope, and many accessories in the way of sieves and surface-nets, thermometers and other instruments, and the bottles and tanks of alcohol. The dredge was usually lowered from the bow, where the rope was also fastened if the tide was running strong. In a gentler current a broadside was presented to the stream by carrying the rope around a thole-pin amidships, but in still water the sails would be resorted to. During the intermission which then followed, attention was paid to surface-collecting and to testing the temperature and density of the water. The hauling of the dredge devolved upon the entire ship's company, and was tiresome in the extreme. The dead weight at the lower end had none of the qualities of a gamy fish, and yielded only to the methodical pulling of the trained sailor. The excitement began with the dump-

CRESTED SOLE AND BEARDED FLYING-FISH.

daring ones were usually assigned to vessel service. The seiners' duties are most arduous. Trained to an amphibious existence, tugging incessantly at the heavily loaded net which catches now and then upon a rough spot, handling many thousand captives every day, and tramping sometimes for miles along the beaches, their outdoor labors are excessive, and yet the vigorous exercise conduces to sound health and hardened muscles. There have, however, been no easy places in any part of this exploring work. Whether with the dip-net along the shores, the towing-net dragged at the surface by rowing, or the dredging-apparatus from the larger boats, the earnest student has ample opportunities to test his physical endurance, as a prelude to his actual observations. Improved and more expeditious methods are fast relieving the so-called drudgery, but, while they add to the conveniences of the seaside laboratory and increase the facilities for turning out results, they are certainly not so beneficial to the general welfare of the naturalist.

ing of the contents of the net into the long, shallow box athwartships, where the overhauling and washing could be done without scattering the sand and mud about the deck. One man was made recorder, while the others carefully examined the material and noted its characteristics and condition. A certain number of specimens were saved in alcohol or by drying, and the balance was cleared away to make ready for the next haul.

This manual dredging was continued rapidly, and as many casts were made each season as with the modern methods; but nothing larger than a hand-dredge could readily be employed from the small boats, and the work was mainly limited to comparatively shallow water. With the acquisition of a small steamer,

contributed from 1873 to 1879 by the navy, came improved facilities, especially in the way of steam-power, which permitted the examination of deeper water and the convenient use of larger dredges, tangle-bars, beam-trawls, and other useful implements. The beam-trawl of the English fishermen was first employed for scientific purposes by the Fish Commission in 1872, and has since been widely adopted by explorers.

After dark the laboratory became the rendezvous of all the members of the party, and the duration of their night's labor was measured by the day's success. It was the rule to close up current observations before retiring, to leave as little as possible for the morrow, except in the case of special studies requiring greater deliberation. The proper time to visit this building was, therefore, in the evening, when every table had its occupant and every one was busily employed. The cross-shadows resulting from the scattered lamps added to the general confusion of the scene, and lent an air of mystery to the many objects covering the floor and tables. The day's catch was, for the most part, still in the large receptacles, as it had been brought in from the field, and each worker was occupied in trying to produce order out of chaos. Transferring the specimens to smaller dishes, he assorted them into groups or species,

making such observations as the time permitted, and then finally disposed of them in alcohol or placed them in an aquarium for future life-studies. It was frequently after midnight when the task was finished, as notes had to be compared and the results discussed before planning further operations.

It rarely happens that so many branches of research are represented at a single field-station as was the case in those above described. The assemblage was composed of both scientific and practical investigators, jointly interested in securing the same ends, but separately engaged on different topics—the general naturalist, with his knowledge of habits and distribution, the embryologist, who could explain the origin and growth of fishes, the hydrographer, whose specialty is the physics of the sea and of the ocean-bottom, and the professional fisherman, expert in the handling of apparatus and acquainted with their effects upon the several species. While the results obtained in each of these subjects had a particular significance apart, to subserve the purposes of the fisheries required that all should be combined and carefully correlated, a task which fell upon the few leaders who alone were qualified to make deductions.

The migratory habits of the summer party terminated in 1881, the year following the building of the steamer *Fish Hawk*, and when the first

A CORNER OF THE SIEVE.

experiments upon the breeding of marine fishes had also been successfully concluded. The continuance of the latter work upon a sufficient scale to give appreciable results required more extensive and complicated machinery than could readily be brought together in the temporary structures previously provided. It was, therefore, necessary to determine upon a proper site and to construct new buildings specially adapted to the purpose. The claims of several localities to such distinction were considered, but the choice was finally given to Wood's Holl, as meeting the combined requirements of the service more fully than any other place. The fishes to be propagated, like the cod, mackerel, and lobsters, were entirely oceanic, and demanded pure sea-water for the development of their eggs and embryos. The biological studies had reference also to the same class of fishes, and a convenient station was desired for the vessels of the commission. No fresh-water streams enter Vineyard Sound or Buzzard's Bay within a considerable distance of Wood's Holl, and its surroundings are essentially marine in all particulars. The little harbor in which the first building had been placed was inadequate to the increased operations, and recourse was therefore had to the larger one near by. A narrow strip of land along the center of this

harbor, having a shore frontage of about a quarter of a mile, was obtained for this purpose in 1882, partly by subscriptions and partly by direct gift from the owner.

While the planning and building of the new station were in progress, the summer party retained possession of its old laboratory, where it was destined to remain until 1885. The new quarters add a prominent and attractive feature to the little village, as much taste and skill have been displayed in their grouping and construction. They cover a small point of land, which has been extended outward in the form of a stone pier, affording greater protection to the inner foreshore and serving as a mooring-place for Government vessels. This pier is rectangular in shape, inclosing an area of water about 250 by 150 feet square. It is capped by a wooden wharf, which divides it near the middle into two basins, the outer one intended exclusively for living fishes taken for their spawn or for study, the inner one serving also as a landing-place for small boats and steam-launches. The buildings, five in number, comprise a hatchery and laboratory combined, a quarters building, a water-tower, a coal-shed, and a storehouse.

On account of the scanty accommodations afforded by the town, the commission has furnished shelter for its assistants in what is called the quarters building, the one nearest to the railroad station, and most noticeable from an architectural point of view. Next beyond it is the water-tower, smaller yet somewhat taller than any of the adjacent buildings, and important as controlling the entire supply of fresh and salt water used about the premises. The third building is deserving of more minute attention, as here it is that the proper functions of the station are carried out. The facilities for fish-culture and for scientific purposes are provided in a single large structure, 120 feet long by 40 feet wide, and three stories high. Al-

THE MARINE STATION AT WOOD'S HOLL, MASSACHUSETTS.

though extremely plain in all its details, nothing has been omitted that is essential to the proper conduct of operations, and it ranks as one of the most complete establishments of its kind. The lower floor is divided into two nearly equal rooms, devoted to propagation and to the aquarian exhibit. The southern room opens directly upon the wharf adjoining the inner basin, and contains a complete outfit for the hatching of cod and lobsters, devised and first made use

buckets from the wharf, can nearly everywhere be drawn from faucets at intervals of only a few feet, and the oil-lamps have been replaced by electric lights. The scientific staff has also increased in size, and the inquiry has been so differentiated that each one has his particular duty to perform, and the hours have become more regular in consequence. Summer continues to be the principal season for these scientific studies, as it is only then that the vol-

of at this station. Many aquariums, arranged in double rows, are utilized for the embryos during the hatching period, but at other times serve for the preservation of living animals, in connection with the scientific work. On the second floor there is a large general laboratory at the northern end, and many small apartments for biological investigations. The physical laboratory, and the photographic and other small workrooms, are located on the floor above, which also furnishes several dormitories to accommodate the overflow from the quarters building. Salt and fresh water are distributed to all the rooms where they could possibly be needed, and in this, as in many other respects, the advantages for study are unexcelled. Each student has a separate supply of salt water at his disposal, and a little aquarian stand beside his ordinary work-table. If these are not sufficient for his demands, he has recourse to larger aquariums in the middle of the laboratory, and to those in the hatching-room below.

There is little about this building to remind one of the older laboratories. The cramped quarters, rickety floors, and worn-out tables have disappeared. The water, formerly brought in

untee assistants can be obtained; but some branches of the inquiry are in progress through the entire year, and the building is always open on account of the hatching work.

During the past four years the marine inquiries of the Fish Commission have been extended to all the sea-coasts of the country, and Wood's Holl has ceased to be the only rendezvous for its vessels, the latter also having convenient laboratories on board, where special researches can readily be carried on. Many problems, moreover, require to be investigated in particular localities, where the conditions are especially favorable, and for that reason the study of the habits and development of the oyster, the shad, the salmon, the Spanish mackerel, and many other species has been conducted elsewhere. The headquarters of the scientific branch are in Washington, where suitable workrooms have been established, and where the collections are brought together.

While seaside laboratories are indispensable to the study of fishery problems, they cannot, unless supplemented by convenient means for reaching distant points, have more than a local value and significance. It was the lack of such

SHARKING.

facilities during the first ten years of the commission that made it necessary to move its summer station from place to place. The construction of the steamer *Fish Hawk* in 1880 rendered this habit less obligatory, while the addition of the *Albatross* soon afterward made a permanent station very desirable in connection with the North Atlantic work.

The *Fish Hawk* was the first large vessel built by any nation expressly for the promotion of the fisheries. The steamers previously employed for this character of investigation had been adapted to the work by only such few additions and alterations as were deemed essential. They were inconvenient at the best, but were made to answer the requirements with the crude appliances then available. A new era as regards the

methods of exploration and of fish-culture was, however, rapidly approaching, and the building of the *Fish Hawk* happened opportunely with respect to the improvements made in both. The clumsy, old-fashioned sounding-line gave place to a slender wire, and the hempen dredging-cable to a small iron rope. The physical and collecting apparatus was also greatly modified, and the hatching meth-

ods were materially perfected in many ways. The *Fish Hawk* was designed to assist in both these branches. Her services were demanded for the propagation of shad in the shallow bays and river-mouths, and she was also needed in connection with the sea-coast work described above. It was, therefore, necessary that her draft should not exceed seven or eight feet when loaded; but, being high above the water, this renders her unwieldy in a rough sea, and her behavior is sometimes disagreeable during heavy weather.

During 1880 the summer party was established at Newport, Rhode Island, in the old abandoned lead-works, whose adjacent shot-tower formed an excellent lookout from which the coming of the new ship was first announced. The previous year a Gloucester fishing-smack, trawling for cod and hake some eighty miles off No Man's Land, had encountered a peculiar fish, which proved, upon examination, to be an entirely new species. A large quantity was captured, and, being of good flavor, several specimens were sent to Fulton Market, New York, where they were well received. Its many golden-yellow spots and stripes had gained for it the name of "leopard-fish" among the sailors, but, being objectionable from a gastronomic standpoint, this term was soon discarded for "tile-fish," having reference to the final syllables of its scientific designation, *Lopholatilus*. Although without significance, this name was thought to grate less harshly on the palate, and to favor the introduction of the fish as an article of food. The discovery of this product within a few hours' sailing of the great metropolis suggested the development of a new and important fishery, and it therefore became advisable to determine, for the benefit of the public, the range and abundance of the species. In assigning the *Fish Hawk* to this undertaking, the commissioner initiated the aggressive offshore operations which have

DRAWN BY W. TABER.

AROUND THE SIEVE BY THE ELECTRIC LIGHT.

ENGRAVED BY W. MOLLIER.

since then been conducted upon so large a scale and with so much success. The tile-fish investigation was prosecuted with great vigor during two summers, and some of the incidents connected with the first cruise are worthy of recording, as illustrating, in a measure, the general methods of the work.

The tile-fish taken in 1879 had been found in about one hundred fathoms. To reach the same place would require a night's steaming, and by spending only a single day upon the grounds, the entire trip could be accomplished within a period of thirty-six hours, as long a cruise as it was considered expedient to make at that distance from the shore. A time was finally selected, upon advices from the Signal Office that no storms were coming up the coast, and with that assurance little difficulty was experienced in obtaining from the shore laboratory the volunteers required for this interesting search. The start was made at sundown, and by daylight on the following morning the steamer had passed within the influence of the Gulf Stream. The air was softened by the tropical current, and the deep blue water, smooth and glassy at the surface, was thickly strewn with many delicate and transparent forms. The first sensation was more conducive to indolent pleasure than to vigorous efforts, but the hours were far too precious for idleness of any kind, and the workers were summoned from their bunks before the sun was fairly up.

The instruments were taken from their places, and the sounding work was at once begun. For the fishing trial a trawl-line of the pattern used on the northern banks for cod and halibut had been selected, measuring several hundred fathoms long, and with hooks at intervals of three or four feet. This had been baited with fresh menhaden the previous evening, and was now coiled in the regulation tub. A brief examination having disclosed the proper depth of water, and the indications being otherwise propitious, the heavy tub was lifted into a small boat which had been lowered from the davits, and was manned by the champion fisherman and

two experienced sailors. Pulling away to give the steamer a clear berth, they began their work by throwing over the upper end of the trawl, an anchor carrying it to the bottom, and a keg-buoy marking its position at the surface. The entire line was then paid out, its further end being secured and indicated in the same manner as the first. Several hundred hooks were thus distributed along the bottom, each with its tempting morsel to attract the fish.

DRAWN BY W. TABER.

ENGRAVED BY P. AITKIN.

LANDING THE BEAM-TRAWL ON DECK.

Time was now given to insure a full catch, and, leaving the little boat fastened to the trawl-buoy, the steamer took up its regular course of work in determining, by other methods, the character of the bottom and its inhabitants. A few successful hauls with the collecting-apparatus showed what animals are peculiar to the region, while the sounding-wire, with thermometer and water-bottle attached,

fibers, arranged in swabs, or bunches, which catch upon all spiny objects and hold them fast. Their range is somewhat limited, but on bottoms where the dredge and the trawl would soon be torn to pieces their utility is recognized.

The *Fish Hawk* is thoroughly adapted to the handling of all appliances of this character. The dredging- and sounding-apparatus are on the upper deck, and are managed by the officers and crew. That part of the main deck directly underneath forms a single large room, having a row of continuous square ports, or windows, on each side, two of which are open to the floor and placed conveniently to receive the dredge or trawl as it is hoisted from the water. This apartment, removed from the annoying features of the heavier operations, constitutes the working-quarters of the naturalists. All the necessary equipment for their study is here provided, and here their time is chiefly spent.

A sounding is made to determine the depth of water, and its temperature and density at the bottom. Then the beam-trawl is bent to the iron rope projecting from the boom-end over the star-board bow, and rapidly lowered, being held for a few moments at the surface to insure the floating of the

DRAWN BY W. TABER.

ENGRAVED BY K. C. ATWOOD.

TANGLES FROM THE SEA-LILY GROUNDS, GULF OF MEXICO.

developed its physical features. It was decided to run a line of dredgings directly seaward. The ground was smooth and well suited to the beam-trawl, the big conical net of which had a much greater scope than either the dredge or the tangles, and secured much larger and more active prey. Held widely open at the mouth by a long beam and sled-shaped runners, and supplemented by a free towing-net on each side, this has become the most formidable instrument in the outfit of the deep-sea naturalist, and has led the way to many wonderful discoveries. The dredge is better fitted for digging in the bottom, and may be used in rather rough places, but on the latter always at the risk of being lost. The tangles are composed of tough hempen

net. Anticipating a fair catch, the large sieve is pushed in front of the outer doorway, a number of pails and tubs are filled with water, and the swinging tables are covered with dishes of many sorts and sizes. The naturalists are a study in themselves. Discarding the spotless linen which distinguishes the naval officer from the ordinary seaman, they have attired themselves in flannel shirts and other garments no longer suited to polite usage. The work is hard, and the material which they handle is decidedly uncleanly in its crude state. Rank is indicated by the application and intelligence of the student, and his garb, however elegant and refined, would bring him no distinction among his colleagues.

The time allotted for the haul varies from twenty minutes to an hour or more, according to the circumstances, and the sound of the reeling-engine overhead is a signal to prepare for action. First the bridle appears, then the beam and runners cut the surface, and the dark-brown net is lifted high in air, giving out a heavy shower of mud and water. Many curious creatures, partly discernible through the meshes, show that the drag has been successful and the bottom is rich in life. A bight of rope is thrown around the bulging net to draw it inboard, when the lower end is opened, and the contents slide rapidly into the hopper-frame forming the upper part of the table-sieve. A soft, oozy mud is the chief constituent of the mass,

also evident among the different members of the staff, each striving to discover the most important features of the catch. Fishes, crabs, shell-fish, serpent-stars, corals, sponges, and hosts of other forms are mingled in confusion, and each specialist has the wherewithal to please his fancy; but in the first scramble he is apt to take whatever is nearest to him, regardless of its final destination. In this manner the principal contents of the sieve are soon transferred to clear water, but some portions demand more patient and deliberate sorting. After a second examination, the specimens are placed in alcohol to preserve them for future study, and to prepare for the next batch of treasures.

The trip may furnish rich results or be only

DRAWN BY J. C. BEARD.

ON THE GULF STREAM SLOPE, FROM ONE TO TWO MILES BELOW THE SURFACE.

covering and concealing for the time its many distinctive objects. This mud forms the deep-ocean bottom, and is composed of the shells of the *Foraminifera* and of other minute animals, some still fresh and living, but the majority more or less disintegrated and fast changing to a powder. Several minutes' diligent washing with the hose is necessary to force this yielding matrix through the meshes of the sieve and to bring its larger occupants to light. During this operation the naturalists give strict attention that the stream of water shall not harm the delicate specimens, which, one by one, are hastily examined and then dropped into a clean receptacle. It is a time of great excitement, which, however, only the initiated can thoroughly appreciate and enjoy. Much pleasant rivalry is

moderately successful, according to the character of the region; but on the day in question the rewards were greater than they had ever been before. The steamer went quickly from one station to another, securing at each cast much more material than could conveniently be cared for. The water deepened rapidly to one hundred, two hundred, and even more fathoms. The descent was gradual from the shore to the point of beginning work, and there the true continental edge was found, the commencement of the real ocean, the depths of which in this vicinity reach nearly three thousand fathoms.

Each specimen was carefully scrutinized as it was taken up, but the usual questions, What is it? and, What is its significance? were diffi-

DRAWN BY J. C. BEARD.

THE MARBLED ANGLER ON ITS GULFWEEED RAFT.

ENGRAVED BY H. WOLF.

cult to answer on this particular day. The complexion of the fauna was different from any that previously had been discovered by the Fish Commission. The region was a new one, and not a member of the party was prepared to find so rich and varied an assemblage in the deeper waters of this northern latitude. A number of the species had been taken in other places, some in the far south and others toward the north, but a large percentage was wholly new. The record greatly exceeded that of any former dredging expedition, and was the equivalent of many an entire season's work. According to subsequent investigations, the conditions here displayed extend a considerable distance up and down the coast, bordering the inner margin of the Gulf Stream and tempered by its presence. Here also, in depths of from 85 to 150 fathoms, the tile-fish

was nourished by the rich diet, and through the influence of the warmer waters retained the tropical brilliancy of its markings.

Notwithstanding the attractive nature of the dredging work, the little boat which had been left to watch the fishing-gear was never for a moment lost sight of, and after a few hours the steamer again came up to it. While it is customary among the fishermen to tend their lines entirely from the small boats, it was determined in the present case to do the overhauling directly from the steamer's deck, in order that any specimens obtained might be handled carefully and every opportunity afforded for making observations. Taking the buoy-line through the port gangway, the anchor was raised on board, immediately followed by the main line, which required the united strength of several sailors to keep it go-

ing. A moment of suspense ensued, and then a noble specimen of the tile-fish lay struggling on the deck. Many more were soon added, and several other species, of no less interest to the naturalists, were also captured. The success of the expedition had been assured, and the report of the fishing-schooner fully verified. No previous cruise had given such positive results and promised immediate returns of so much practical value. It now remained to determine the range and abundance of the species, an investigation which was continued with much profit during the same and the following summer, the largest single catch amounting to 73 tile-fish, weighing from 3 to 32 pounds apiece, and aggregating 550 pounds. During this period, however, the *Fish Hawk* was also employed in many other kinds of work, both in the line of exploration and of fish-culture.

During March and April, 1882, a number of vessels arriving at New York and other ports reported large shoals of dead and dying fishes at the surface, through which they sometimes sailed for many miles. They were first described as cod, but, after specimens had been properly identified, they proved to be none other than the tile-fish, together with occasional examples of some of the rarer species associated with them on the same bottoms. Some calamity had overtaken them, but its character and causes have never positively been determined. There were no marks of violence or disease on any of the specimens, and many still seemed to have a spark of life remaining when lifted from the surface. The period of their destruction was immediately preceded by severe storms, which may possibly have agitated the inshore waters sufficiently to force a colder stratum from the arctic current over and upon their grounds. A sudden change of temperature, however it may have been produced, offers the most plausible theory for the accident, and is the one now generally accepted. The extent of the destruc-

tion may be appreciated from careful estimates, which placed the number of dead fish at several hundred millions, and their total weight at over a billion pounds. During 1883 it was impossible to take any tile-fish upon the old grounds, and several other fishes and invertebrates formerly living with them had also disappeared. Repeated search during subsequent years has proved equally unavailing, and if any survived to repopulate the region, the fact remains to be determined.

The exploration of the tile-fish grounds broke the barrier which had previously confined the work along the coast, and showed that, even with so frail a vessel as the *Fish Hawk*, valuable results could be accomplished at some distance from the shore. No one doubted the utility of an examination of the deep-water grounds, but it needed a practical demonstration to give it the necessary impetus and support. Direct observations had never been undertaken to determine if the varying abundance of such important fishes as the mackerel and menhaden was due to natural causes or resulted from man's interference. The cod and halibut banks resorted to were chiefly accidental discoveries, and no systematic researches had been made to ascertain their full resources or to develop new regions. South of New England the offshore waters were scarcely known, and those of the Pacific coast were still a mystery, even to the fishermen. The *Fish Hawk* was evidently unsuited to the study of this class of problems, which required a more continuous sea service, regardless of the conditions of the weather. A larger and stronger vessel of a totally different type was urgently demanded, and was soon provided.

The *Albatross* was built in 1883, making her trial trip on December 30 of that year. She is entirely novel in construction as well as in the character of her work, having no counterpart among the other nations of the world. Her

SOUNDING THE ABYSS WITH PIANO-WIRE.

plans were based upon the experience of the Fish Commission, and also of the coast survey and naval service, adapting her to every kind of exploration from which the ocean fisheries could derive a benefit. As the name implies, her home is on the open waters, whether upon the shallow banks or over the most profound depths, and her conduct under trying circumstances has been extremely gratifying. It was only natural, however, that great difficulty should have been experienced in bringing so many new features within the narrow compass of a single craft. The addition of a civilian scientific staff, of laboratory quarters on a large scale, and of coal facilities for long cruises, were among the matters which it was necessary to consider and adjust; but all perplexities were finally settled in a satisfactory manner.

The *Albatross* bears no resemblance to the *Fish Hawk*, either externally or in her interior arrangements. Her lines are graceful, and her depth is proportioned to her height above the water. The total length is 234 feet, and the displacement 1074 tons. Besides the steam-power, acting through twin screws, she is rigged like a brig, and is provided with high bow and stern, the latter being modeled with special reference to her backing against sea and wind when dredging. The main deck is partly

covered by the topgallant-forecastle, the main house amidships, and the poop-cabin, but the space required for the working-apparatus is ample and conveniently arranged. These appliances are chiefly forward of the pilot-house, among the more conspicuous being two machines for sounding with piano-wire, and the heavy dredging-engine with its accumulator and long boom. The iron rope is stored below upon a large reel capable of holding over five miles of this tenacious cable. The methods of operating the apparatus are essentially the same as on the *Fish Hawk*, but, having no large openings at the sides, the dredge and trawl must be lifted over the rail, and the washing of their contents is conducted on the upper deck.

The scientific quarters have been placed together amidships, where the motion is least perceptible. The upper laboratory occupies the middle portion of the deck-house, and is lighted by means of windows instead of ports, and by a skylight overhead. Although only about fourteen feet square, it is well equipped for certain branches of investigation, and contains the library and medical dispensary. A stairway leads directly to the main laboratory on the lower deck, and this, in turn, communicates with the scientific store-room in the hold. The former extends entirely across the ship, and includes facilities for detailed physical and biological inquiries, a photographic dark room, and large series of drawers and sliding-trays for specimens and instruments. The steamer is lighted throughout by means of the Edison incandescent electric system, in connection with which there is a powerful arc-

lamp for illuminating the deck at night, and several search-lights for submarine use.

The *Albatross* represents the final stage in the development of exploring methods applicable to the study of the sea, and, having suitable means for elaborating the results on board, she is, moreover, a perfect floating workshop. Every appropriate device for collecting and for scientific observation has been provided, not omitting even the simplest forms of fishing-gear. Officered from the navy, as is the *Fish Hawk* also, experts in hydrography and seamanship have been enlisted in her service, and many young civilians and naval men have received from her most efficient and useful training.

The explorations of the *Albatross* and of her more humble predecessors have afforded a golden harvest for the naturalists, apart from their results of economic value. While the dredges, nets, and tangles are searching for

pearance are unusually common, and among invertebrates extravagant shapes and odd structures are just as frequently encountered. The surface waters contribute also a great wealth of life, especially in the pathway of the Gulf Stream or along its borders, where countless tropical forms, like the physalia, paper-nautilus, and marbled angler, are slowly drifted northward. The surface-nets and gigs furnish an enjoyable occupation from the vessel's rail, and at night, with the electric lights submerged a few inches, the catch is much increased. Then it is that the swift-darting squid appears in schools, and, dazzled by the glare, impales his long arms upon the cluster of sharp hooks, moved gently up and down to attract his notice. Fully as active, and far more difficult to capture, is the surly shark, bent on large prey, the sworn enemy of the sailor, and duly made to suffer for his supposed crimes when in the latter's power.

the food species, and determining the essential features of their environment, they must necessarily disclose the curious forms as well. Nowhere have the zoölogical discoveries of recent times been richer, both in number and in variety, than in the deep sea, a province which successfully defied intrusion until within a comparatively few years. Fishes of remarkable ap-

More recently a third addition has been made to the little fleet of Fish Commission vessels, a schooner of eighty-three tons, having a deep draft and good speed. Combining the best features of the American and English fishing-vessels, she was specially designed for the offshore banks, but that has not prevented her employment in both the ex-

ploring and fish-cultural branches of the work, for which she is well adapted. The *Grampus*, as she is called, has already attracted much attention, and her lines are frequently copied in the modern smack.

Having described the methods suited to the scientific study of the fisheries, it remains to explain the manner in which they may be utilized for the public good, and the extent of their application up to the present time.

It has been the principal office of the steamer *Albatross* to develop the resources naturally existing along the sea-coasts, the fishing-grounds which are little known or have never been

habitants of the favored spot. The soundings are brought closer together until its area and contour have been defined, and its limits accurately plotted upon the chart. The temperatures and currents are observed, the dredge or the trawl vigorously employed, and frequent trials made with the fishing-gear best adapted to the circumstances.

The value of the information thus obtained is direct and pertinent. It gives the fisherman the precise position of a fishing-ground of the very existence of which he may formerly have been ignorant. The outlines are printed on a map, from which he learns its bearings from

discovered by the fishermen. To achieve this object in a thoroughly comprehensive manner requires a detailed examination of the bottom over extensive regions. Lines of soundings, run near together, determine its character and the depth of water. The beam-trawl or the dredge makes known the richness of the life, and the food on which the fishes subsist; oftentimes the fishes themselves are taken by the same means. With hooks and lines, with the more effective cod-trawls, and with various forms of nets, a better knowledge is obtained of the presence and abundance of those fishes, and of the means to be suggested for their capture upon a commercial scale. As a matter of fact, the sounding-lead in the hands of an experienced sailor is, in many places, a comparatively good criterion of the value of the bottom, and by its constant use a large area may rapidly be eliminated from the field, as consisting of barren sand or soft, sticky mud, or as having too great a depth. As soon as a change for the better is perceived, efforts are at once redoubled to ascertain the peculiarities and in-

any given point, or its latitude and longitude. Instructed as to the species which resort to it, and their abundance, he has the means of determining for himself whether it warrants his attention, and, if the habitat of a rich growth of animals, he has the additional assurance that the ground is permanent, being frequented for feeding purposes. Many grounds, however, are at the surface, where the conditions are generally less uniform and the problems presented more difficult of solution, the fishes concerned being chiefly migratory in the widest sense. The study of these grounds has scarcely passed the experimental stage, and yet some good results have already been accomplished in respect to them.

The *Albatross* began her first work in April, 1883, and several months were spent in tracing the movements of the mackerel and menhaden, and in developing the tile-fish region south of Martha's Vineyard. During the three succeeding years she was almost continuously at sea, and her operations were extended from Newfoundland to South America. Two cruises were

made across the great eastern banks, the Bahama region was examined in a vain search for the winter home of certain pelagic food-fishes, and a hydrographic survey of the Caribbean Sea was successfully conducted in the interest of the navy. An appreciation of the value of these researches soon led to a demand for simi-

ing an extent of nearly forty degrees of latitude, the western coast-line presents a great diversity of climate, which is favorable to prolonged operations, and, notwithstanding that its hydrography was little known, the survey has been pushed ahead with great rapidity, and yet with greater thoroughness than any previous ex-

lar investigations on the Pacific side, and the importance of the latter was justly recognized. Certain changes in the machinery of the steamer, deemed necessary before sending her upon so long a voyage, delayed her transfer, however, until the autumn of 1887, a short time subsequent to Professor Baird's death.

It was May, 1888, when the *Albatross* reached San Francisco, and in the mean time the office of Commissioner of Fisheries had been conferred on Colonel Marshall McDonald, a distinguished assistant in the service. Although resolved to carry out the policy established by Professor Baird, it seemed to him expedient to institute some changes in the conduct of the scientific work, with the view of securing more immediate benefits for the practical fisheries. The plans drawn up for the future guidance of the *Albatross* accordingly restricted her inquiries almost entirely to the submerged continental platform, the seat of nearly all the "ground" fisheries, as above explained. Hav-

ploration of a similar kind. The area covered up to the present time amounts to over one hundred thousand square geographical miles, and includes the coast from San Diego to Vancouver Island, the submerged border south of the Alaskan peninsula, and the southeastern part of Bering Sea.

Investigations of the same character are illustrated by much of the early work of the commission, particularly on the New England coast. Of more recent date have been the explorations of the *Fish Hawk* on the tile-fish grounds and oyster-beds, and of the *Grampus* on the red-snapper banks of the Gulf of Mexico and in the mackerel region. The inquiry last mentioned has been one of the most interesting as well as difficult and puzzling studies that have yet been taken up. The mackerel and menhaden, together with other pelagic species, and the anadromous fishes, like the shad and salmon, are regulated in their movements by changes in the temperature of the water. The condi-

DRAWN BY J. C. BEARD.

SQUID AND DEVIL-FISH.

ENGRAVED BY H. WOLF.

tions which control the latter species in the rivers have been comparatively well determined, but such is not the case with the pelagic forms, whose distance from the shores generally prevents convenient access to their haunts. During nearly every season since her building the *Grampus* has followed the mackerel northward from their point of appearance on the coast, her cruise extending on one occasion as far as Labrador. Although making all the customary observations, as did the *Albatross* in the same field, they were naturally too remote from one another, too disconnected, to furnish a basis for deductions. In order, therefore, to ascertain with more exactness the laws of temperature in the body of water which these fishes traverse, the *Grampus* has spent three summers in studying this single problem, with every suitable appliance known to science, having the assistance also, during one season, of the coast-survey steamer *Blake*. Through a wide section of the sea, extending 150 miles off Martha's Vineyard and Block Island, parallel lines of stations have been run at intervals of ten miles in both directions. At each of these points the temperature and density were observed at many intermediate depths between the surface and the bottom, and the same was repeated as often as the season would allow. The results give numerous vertical sections through the water, which indicate the thickness and distribution of the different bands of temperature and currents, and show their variations from time to time. It now remains to determine their relations to the atmosphere

and to the bodies of moving fishes, and to ascertain if the migrations of the latter may thereby be predicted.

The deterioration of fishing-grounds, as previously described, is the subject which led primarily to the organization of the Fish Commission. The occurrence of a decrease is established by statistics, its causes and remedies are determined by scientific investigations, and its replenishment is accomplished by fish-culture or legislation. The first few volumes devoted to the annual operations of this service show how thoroughly the matter has been treated, and how applicable are the modern methods of research to problems of this kind. The causes may be due to natural or to human agencies, often readily observed; the remedies are more perplexing, and require the judicious consideration of many questions which the survey proper does not reveal. The manner of conducting the inquiries does not differ essentially from the study of new grounds, but necessitates a greater attention to details, including the fishery methods of the region, and has been limited chiefly to coastal waters and to the lakes and rivers.

Subsidiary to this problem is the study of the life-history of fishes from their earliest stages to mature age, and of their habits under all conditions. These studies are necessary, in order that efficient steps may be taken for the formation of new fishing-areas, and for the protection and improvement of those already known. Aside from their development, with which the embryologist has to deal, carrying

on his work at one of the stations of the commission, or at some other convenient point, there are many grave questions for consideration. It is well known that shad and salmon return with astonishing regularity to the rivers where they spawn. Many other useful fishes are landlocked or inhabit small streams; but how is it with those marine species which never leave the salt water? Within a few years it has been decided to attempt the restoration of the inshore fisheries for cod, once affording a profitable occupation, but now depleted nearly everywhere. Is it practicable to reestablish fishing-grounds where no defined boundaries exist, where the entire ocean is before them? The case varies with the species, and must be determined separately for each. All have their special habits, some favorable to human influences and others equally opposed to them. Certain bodies of the cod, spending their summers in the open sea, return each autumn to their chosen spawning- and feeding-grounds in shallow water, while others prefer the rocky shores at all seasons. To increase the numbers of either kind is to enlarge the schools which assemble periodically within the reach of the smaller fishing-boats, or live continuously at their mercy. This fact, first proved by observations of the adult fish, has been confirmed by the hatching work of five years past, the young, in countless multitudes, now filling every favored spot from Narragansett Bay to Maine. What is possible with the cod may be repeated with many other species, and has been done with some; but until their habits had been studied, it would have been a waste of time and money to undertake their breeding. It is still an open question as to whether the artificial propagation of either the mackerel or the menhaden could be carried on with profit, but the lobster is even more restricted in its movements than the cod, and the oyster may be brought entirely within control. Both of these species are good subjects for careful nursing, and both are receiving much attention.

Fishery legislation, whether applied to ex-

hausted or to prosperous grounds, should be based upon the principles which this inquiry has demonstrated, and fishery methods should be guided by its teachings. The older system, still generally prevailing, makes no provision for the future, and to its workings is chiefly due the present need of cultivation.

Another promising field in which a remarkable progress may be recorded is the transplanting of useful species, the formation of new fisheries. By this means a food-supply has been created in many regions, and its variety and abundance have been increased in others. To accomplish this successfully requires a knowledge of all the conditions natural to the fishes, and a thorough study of the waters where their planting is proposed. In the interest of this division, as of that relating to depletion, a systematic survey of the inland waters is now in progress. Every river-basin is made the subject of an exhaustive investigation, which discloses its physical characteristics, the different kinds of fishes—useful, predaceous, or otherwise—concerned in its economy, and the lower forms of life constituting the basis of the food-supply.

Science stands, therefore, between nature and the fisheries as a willing and helpful agent, powerful in its influence to promote the general good. From the experimental stage its progress has been gradual but decisive to the higher plane, where its benefits are no longer problematical. Whether in the discovery of new wealths or in the reparation of former industries, its services are acknowledged to be essential. It teaches the principles of fish-culture, and leads the way to proper legislation and judicious fishery methods. The policy so liberally supported in this country has no stronger advocates at present than the selfsame people who first taught Americans how to fish, but who are now content to follow in their footsteps. The warm indorsement of Berlin, in 1880, and of London in 1883, was a tribute fairly earned and well deserved by the honored founder of this service.

A SLIPPER WITH SEA-ANEMONE.

CHARACTERISTICS.

BY S. WEIR MITCHELL, M. D., AUTHOR OF "IN WAR TIME," ETC.

IX.

On a quiet Sunday afternoon Vincent, St. Clair, and I were wandering in the park. St. Clair was amusing himself over Clayborne's peculiarities. "I wonder," he cried, "that he needs any friends, considering the many great and famous folks with whom he associates in his library. I think that his books are more real to him than are we. He even comes near to poetry when he talks of them. I know they affect him as they do but few. I declare to you, I can tell of an evening what kind of books he has been reading. You know he is capable of awful exercise in this way, and will read straight through a day play after play of the Greek dramatists, while dressing, and at meals, never leaving the house. I have known him to read all of Bossuet without pause, and when I asked him once what he had been doing the past week, he said he had gone through Bernal Diaz del Castillo (what a noble name!), Southey's "Brazil," and a beautiful tome, the size of a small house, about Peru, by one Garcilaso de la Vega. He showed it to me. It has horrible pictures of Incas burned alive. I tried the work on Brazil a few minutes. Alas!"

To this long discourse about our friend Vincent and I listened with much amusement as we strolled in perfect weather under the trees and along the west bank of the river in our great city park.

The park, clotted with groups of happy people enjoying the quiet and the green stillness of the trees, was yet so vast as in nowise to trouble us by their number, or to take away from the pleasant sense of ownership we have in our many-acred domain.

Said Vincent presently, "And you think, my dear fellow, you can tell what literary society Clayborne has been keeping?"

"Oh, I can; indeed, I can, sometimes. One evening (it was a month ago) he had very fine manners. He has n't very good manners usually, but this time he quite reminded me of—well, of you, Vincent."

"Oh, really," said our friend; "of me?"

"Yes; and it turned out that he had been, as one might say, to call on Mme. de Sévigné,

and had met Beaumarchais rather later, and La Rochefoucauld. He hates poetry,—all modern verse at least,—or I would lend him my Villon, just to see what a delightful scamp he would come to be for an evening."

"It is a wonder that he can endure you at all," said I. "Nothing annoys him more than vain questions, as he calls them; and for a fact, St. Clair, you have a distinct capacity in that line."

"I know it. He does n't mind telling me. He says I am like an intelligent child; that I come, like Hamlet's papa, in questionable shape; and such other felicities of abuse."

Much amused, I glanced from him to Vincent's face of sympathetic mirth. The poet had a look of childlike joy at the remembrance of being looked upon by Clayborne as a troublesome infant. He had what Vincent called an instinctive nature, and the world seemed to teach him no lessons, and experience to fail as a schoolmaster. Yet, on the whole, I think he was of us all the most happy.

I never saw any one quite like him in the infantile way in which he could be influenced for the time by his associations; and in bad society he had been known to be very naughty. But this neither lasted very long, nor affected him in a permanent manner; and with us he was ever at his best, which to me at least, and to Vincent, was always better than the best of most able men, for in his double way of sculptor and poet he was distinctly a man of genius.

Evidently both Vincent and I were at one and the same time thinking, with our companion as a text, for the former said presently:

"Your notion about Clayborne is very amusing."

"And just what do you mean?"

"Oh, what you said of Clayborne. I was thinking about it. Your statement of the peculiarity was—well, rather poetical, and yet measurably true. The intercourse of men does not influence his ways or conduct, but the quality of the books he has been reading does appear in his thought and manner."

"Is it not," said I, "an instance of the automatic imitativeness one observes as so variously influential in life? It is men who thus affect me. If I am with a man of noble manners, I too become stately in my fashions for the hour; and with rough-mannered men I find I must be on my guard."

"Yes; I know that—I know that," returned St. Clair, ruefully.

"Great genius," said I, "perhaps only the greatest, escapes the influence of this animal quality of imitativeness; but you can still see it in the youth of the poets, and sometimes even later. I should like to see an essay on the 'Relations of the Poet to Poets.' They are nearly all ignorantly, or of purpose, imitative in their early verse."

"But is it not interesting, too," returned St. Clair, "to notice how the individuality of the man may still exist with unconscious imitation? I wonder if Wordsworth knew how much of Scott got into his splendid ballad of 'The Feast of Brougham Castle'; and yet there are lines in it which only Wordsworth could have written."

"And," said I, "is n't there a ring of Byron's vigorous march of verse in those lines I love so well, 'Fleet like Tartar's reinless steed'?"

"The same tendency to borrow form or matter is in the early compositions of the great musicians," remarked St. Clair. "At least, so I am told."

"It is very human, no doubt," I returned; "and of course one sees it intensified to morbidness in disease—in hysteria, and in rare cases of insanity, where a man repeats automatically the words he hears, or the gestures of the man at whom he chances to be looking."

"Are there really such cases?" Vincent asked.

"Yes; I have caught even myself repeating unconsciously the facial spasm of a man I was intensely watching. The subject of hypnotism is very apt to be the victim of suggestion, and to have set free that imitative instinct which we usually keep under control. In fact, these cases are often the mere sport of varied forms of suggestion. If, without other hint, you pinch together the frontal muscles of one of these sleepers, so as to imitate the facial expression of a frown, he will at once become angry, perhaps furiously so, and swear, or strike a blow. If you make his cheek-lines assume the curves of mirth, this suggests amusement, and he roars with laughter. He is delicately susceptible to the hint, and responds at once."

"Then, probably," said Vincent, "to allow our features to assume the first slight expression of passion is a step toward failure of self-control, because what is true of the morbid in a high degree must be true in a measure of the wholesome."

"Yes; one sees that in emotional people. The yielding to tears is the first step down a bad staircase, where, soon or late, serious trouble from loss of moral balance awaits the feeble."

"And to yield," said Vincent, "is to make

at last a habit. Repeated resistance to the slighter physical expressions of emotion must end in making self-control easy."

"Yes; that is true. It is the constant lesson we have, as doctors, to teach the hysterical. They are always in danger of being trampled on by their emotions. They can take no risks. For them even excess of mirth is dangerous. What the children call a 'gale of laughter' ends abruptly in an explosion of tears, and then the brakes are off, and away they go."

"Pathos is the very shadow of humor," returned Vincent. "We all know that, and yet the grave begets the gay more surely than the reverse occurs. It seems curious that the expressions of the two states should in nervous people reverse the rule of succession. I mean that these should tend more readily to pass from mirth to tears."

"That is not accurately correct," I said. "Tears with them beget laughter, and the opposite is also true."

"You men are getting out of my depth," cried St. Clair. "I hate self-control except in other people. It creates habits, and I loathe them. The only habit I have is the habit of having no habit; one inherits too many as it is. There is a nice story in that big book on Brazil; it is the only thing I got out of it. It will answer to kill your large talk. An ancient Indian convert of the Jesuits, at Para, was sick to death, and being asked by the good padre what delicacies he would like to comfort him on his way to purgatory, said, 'I should like the tender hand of a Tapuya boy, well broiled.'"

"Certainly it illustrates the permanence of original habits," said Vincent, laughing. "But habit—"

"Oh, don't begin again," cried St. Clair, who professed to detest psychological talk. "Look at what you are missing."

"You are right," returned Vincent. "'Your solid man sees not the sky.' Is n't that Emerson?"

"Yes," said St. Clair; "and his is also, 'Show me thy face, dear Nature, that I may forget my own.' That is what this is good for."

As he spoke, he led us through a hedge of underbrush, and we came out on a green space with groups of stately tulip-trees and oaks. A little beyond them a marble-paved spring welcomed us. Overhead were maples of great size and breadth of wholesome leafage. Their roots were peeping out in white fibrous bunches into the half-choked spring, alongside of which St. Clair threw himself at length, while Vincent and I sat down on the grass at a little distance. For a while we said nothing. The clouds mottled the sunshine on the woods and turf as they sailed overhead, and the waters,

finding a voice with their new birth, troublously whirled around the stone-built pool, and gurgled out through an irregular latticework of roots, murmuring more and more noisily as they tumbled down the slope.

Meanwhile I watched our poet's face. His cap was off, and below the crown of brown half curls his face expressed in its varying lines a sense of the joy he felt. I knew that he was more near akin to it all than we.

As I looked, Vincent called my attention to a tree near by, and, rising, for a few minutes we wandered away. As we returned, I touched Vincent's arm, and we stood silently observant. St. Clair lay on his back beside the spring, dabbling in it with his hand, his head against the rising bank of turf. I had seen him in such a mood before. He was improvising. Quite unconscious of our presence, he broke out into verse, and then fell away to prose again, or let fall a rime.

"I see it, I hear it; a fawn I be, and this is my playmate, new-born like me. A fawn on the hillside, a brooklet is he. How the water finds a voice, and warbles meaningless things; sobs and cries like an infant just born! I break the clear mirror, I prance in the stream; I laugh with its laughter, I dream with its dream. It does not wait for me, my new playmate. It is off and away: past rocks we go, twin-leaping things, until at the cliff-verge I see it spring from the edge. I dare not to follow the curve of its leap. I hear its wild cry. Is it dead or asleep? 'Mid the ferns far below lies a quiet smoothness, so still, ah, so still! Are you dead, pleasant comrade? Then with fear I go down, with my sharp ears intent, until far away on the grass-slopes I find my little friend. I see it trickle out of the rocks in jets, and remake itself again, and go athwart the slope, joyously tossing the grasses on its way. Then I know that my new-born friend can take no harm, and is as the gods—immortal."

"Is this the way they make verse?" whispered Vincent.

We need not have feared to disturb him. St. Clair was at times more simple than a child with its mother. He turned, in nowise embarrassed. The mood of wrapt, fanciful thought was gone, and, sitting up, he said pleasantly, "Ah, you heard me. By Zeus! but a fawn I was for the moment." Meanwhile Vincent looked on, in his face a faint expression of withheld surprise at the naturalness of the man.

"Were I you, I would carve me a new-born fawn by the just-born fountain," said I, "and put your mood in verse on the rock near by."

"I could not," cried St. Clair; "I could not. The song is gone. To sing it anew, I should have to recapture the mood, and that is impossible.

"I heard a bird in the air above
Sing, as he flew, a song of love.
To earth, from heaven overhead,
All the soul of love it said;
But the bird is gone, the song is dead,
And heaven is empty overhead.
If I were the bird, or the song were I,
I may not know until I die,
And somewhere in the world to be,
Chant again, with soul set free,
Its rapture of felicity."

"Whose is that?" said I.

"Mine. I made it for you now as it came. I like it; I shall not to-morrow. Do you like it, Vincent?"

"My dear fellow, I have been shaking myself up inwardly like a kaleidoscope to see if I could get my confused mental atoms, by happy chance, into some form of sympathy with you and yours. I cannot."

"And," said the joyous face looking up at him, "it seems to you nonsense. Does n't it, now?"

"Not that, not just that, but incredible, curious; and, frankly, I do not care about it as a product. I see it gives you and others pleasure. It gives me little. Sometimes I like the verses which jingle agreeably."

"O Vincent! Well—"

"Yes; I suppose rime is the sugar of verse, but I soon find it is only the sugar I am liking, and at the end I can't tell what it all meant."

"He has been reading Swinburne," cried St. Clair. "A wild debauch of rime and rhythms, and the sense gets seasick on a rolling ocean of rhythmic billows. I hate him. You like Owen Meredith. I know it; I am sure," he added, with mild scorn.

"Well, yes," said Vincent, smiling. "I do—sometimes—a little—not much."

"It is a demi-mundane creature, not a poet at all."

"I can read Milton and Browning—some of him—and Pope," said Vincent, defensively.

"And the greatest—what of them?" said I. "We may as well know all your wickedness."

"Oh, those. Those are the revelations. 'The gods who speak in men.'"

"And Wordsworth?" said St. Clair, wistfully, and as if he were tenderly mentioning some well-loved woman. "Out with it!"

"And Wordsworth?" repeated Vincent.

"Do not fear that I shall be so commonplace as to sneer at him. Yes; I can read him. But how was it that he could fly to-day and crawl to-morrow—never seemed to know if he were in heaven or of the merest earth? Tell me why so many poets lack power to criticize their own work, and yet the making of it presupposes critical labor soon or late. The poem you began to quote from Wordsworth the other day

I had never chanced upon. I went home, and read and learned it. The first two verses I care less for, but the last is like a storm for vigor, like a trumpet for power to stir you; and yet I do not see them in any of the volumes of selections."

"Say them," said St. Clair.

"I can. You of course know them; they record the fate of the French armies in Russia.

"Fleet the Tartar's reinless steed,
But fleeter far the pinions of the wind,
Which from Siberian caves the monarch freed,
And sent him forth, with squadrons of his kind,
And bade the snow their ample backs bestride,
And to the battle ride.
No pitying voice commands a halt,
No courage can repel the dire assault;
Distracted, spiritless, benumbed, and blind,
Whole legions sink—and, in one instant, find
Burial and death: Look for them—and descry,
When morn returns, beneath the clear blue sky,
A soundless waste, a trackless vacancy.

How the first line tramps through one's brain, and how solemn is the silence in which the ending leaves you! Pardon me, St. Clair, if again I am stupid enough to wonder how he who struck this note could —"

"No, no, Fred!" exclaimed the poet. "The children of the brain are like the children of the body. You say that is a fine lad, and how crooked is his sister. Do you think the father feels responsible?"

"Ah, my dear St. Clair, illustrations are full of peril. Verse has no grandfathers, and, really, I think some of your master's acknowledged offspring might have been left at his doorstep in a basket by — by —"

"Now, take care!" laughed St. Clair.

"Well, by some Muse of easy virtue."

The poet laughed, and then said thoughtfully: "The answer lies here. All the great poets have written much. That is as if you were to say that you or I talk much. Verse is their natural mode of expression, and there being in many of them a childlike despotism of temperament which the world cannot subdue, they sing what they feel, or think, or desire. That is all of it, Vincent — or one word more. This must result in the product being often poor. But then a time comes when health, joy, opportunity, suggestion, nourish the prosperous hour, and something great is done."

"But," urged Vincent, "why cannot they, like other men, see where and how they have failed, and then suppress for us the mass of stuff they leave us?"

"Let me answer him," said I. "For the lover of verse there is less of this than you think, and among the worst products of the best men there are lines one would not lose. This is true even of the lesser poets—Crabbe, Somerville.

I should be glad to have written those lines on a good physician,

"And well he knew to understand
The poor man's cry as God's command.

Yet, who reads Somerville?"

"Remember, too," said St. Clair, "that self-criticism is a thing in its fullness impossible. A man would have to forget and live again. The poem is, for the writer, a thing made up of the poem and the remembrance of all that went to form it—the joy, the pain, and what not. It has for him the delightfulness the new-born child has for the mother. A poet once said to me, 'I make my poems swiftly, when in the mood, and afterward, except as to minor verbal changes, am about as helplessly uncritical as is a bird of its song. Always my last is for me my best, and then in a year I cease to love it. But, surely, as nurses say, my last poem puts out of joint the noses of all the rest.'"

"I have not heard that bit of nursery-talk since I was a boy," said Vincent. "It is more meaningless than most of our childish folk-lore. But you have not answered me; you have only restated the facts."

"I think I have answered you," said St. Clair; "and you must remember that what another says of a poet's verse (however just the comment) is to the poet as mere babble. And then, too, the great critics are more rare than the great poets, which is curious to me, but I think true."

"Some one should write the history of criticism," said Vincent.

"Do you know Dallas—'The Gay Art'?"

"No, or rather yes; it is an unreadable book, despite its learning. Even Clayborne could hardly stand a full dose of it. I read a goodly part of it with wonder and fatigue."

"I doubt," said St. Clair, "if any man who writes were ever the better for the critics—I mean as a writer."

"That appears to me absurd," said Vincent. "A good course of Sainte-Beuve might make you believe that such a thing should be possible, unless all men who write are idiots."

"But in this country," I urged, "we have only one critic worth the name, and he has no ear except for the past.¹ Yes; we could give up one half of our authors for a critic like the author of the 'Causeries du Lundi.' Come, let us go. Come." And we moved through the field and into a noble woodland.

"Look at that creeper," said St. Clair. "An English friend wrote me last year to ask what I meant by

"Autumn vines
Ablaze within the somber pines."

¹ And now, alas! since these lines were written, he, too, belongs to the past.

"And pretty hard it must be on the Canadian poets," laughed Vincent, "that along the rivers of New Brunswick the wild rose has no thorns. There is the frog-pond below us. Just hear them; they speak all the tongues. The American boy calls them 'bloody nouns.' Do they say that?"

"They do," said I, "and anything else you please. I wonder what Russian frogs say; the Greek frog is immortal. I once fell in with some ex-rebel brigadiers in North Carolina, and, among other good things, I carried away one delightful frog story. I wish I could give it the flavor of the very pleasant Southern tongue.

"The Yankee soldier, settled in Roanoke Isl. and after the war, complains of his fate.

"No, sir; I don't git on, I'm that bothered. I don't mind bein' shot at—used to that; and I don't mind cussin'—cusses is soft sort of things. But when a fellow 's tired 'bout sundown, and ye gits seated on a smooth-topped fence-rail, and tucks yer toes under the third rail, and lights yer corn-cob pipe, and is jus' comfortable, and ye git to thinkin' of the ole home and the apple-orchard and bees—then them thar derved grayback frogs commences. And one of 'em he says, "Bull Run!" and another he says, "Ball's Bluff!" and at las' one little cuss gits up on his toes 'way out in the ma'sh, and he says, "Cheeckahominy!" I can't stand them there frogs. I'm jus' goin' to leave."

"The story is rapidly improving under your hands," said Vincent.

"For shame," I returned. "What ingratitude!"

"Odd, is n't it," said St. Clair, "that every one has a kind of tender feeling for frogs, and worse than none for toads?"

"I admit it," said I. "I loathe toads. As a fact, they secrete from the skin-glands an acrid and quite deadly poison; if for defense or not, I cannot say. But come, it is getting late."

"One moment," said Vincent. "Before we go, do look at these trees. Really, there are few such collections of unusual trees. These cypresses are old friends of mine; this must be their northern limit."

"Of course they are not natives," I said. "And they have lost their southern habit of sending up little conical shoots from the roots—what they call 'knees' in the South—a puzzle to the botanists."

"Probably want of moisture has to do with their absence here, because our monumental cypress at Bartram's garden in wet ground has numberless knees. Only a few miles from here stands the most northern papaw-tree."

"Do you remember," I said to Vincent,

"that it was under that great cypress you and I first met?"

"I do, and pleasantly well I remember. We were only lads then. You were looking up at its vast branchings with your hat off. You uncovered as you approached it."

"It is a feeling I often have that I must uncover to a tree like that. I have always felt grateful to the sturdy old fellow who silently introduced us to each other."

"That's rather nice," said St. Clair. "About trees we are all of a mind. I wonder there never was a tree worship."

"And," I added, "what various pleasure one gets out of them, how many kinds of joy."

"I have said before," remarked Vincent, "where my own limitations lie. My pleasure is in simple observation. When people talk of books which influenced them, I gratefully think that it was Ruskin who taught me what to see, how to see, and the happiness of it. Then I would come to a place where he spread wings of a larger delight, and left me sighing."

"One should train children to see," I said; "really to see. What is to be had in the way of enjoyment out of the trained powers of the naturalist none know who are not familiar with the higher grade of such students."

"And that I can more easily comprehend," returned Vincent.

"You ought to know Leidy,"¹ I said. "You remember my speaking once of his memory for specific names. As were Agassiz and Wyman, so is he to-day a delightful companion. He would stand here and call by name every living thing, and the stones beneath your feet also. Turn over a bit of rock, and as the queer tiny menagerie of its sheltered life scuttles out, he knows them one and all—their lives, their marriages, what they eat, their ways, their deaths, a hundred little dramas of this swarming vitality. And then the knowledge is all so easily given, with so much placid enjoyment, with such childlike directness, and yet with but little sense of the deeper poetic relationships which they bring to a rare few. He has the morale of the best naturalists—simplicity, earnestness, and magnanimity. To help others to observe is his greatest joy, and, my dear St. Clair, he does not really care a sixpence for all the poetry from Homer to Longfellow."

"Poor fellow," said the sculptor. "If that is where science takes a man, leave me to my folly."

"Happy man!" said Vincent. "Come, the dew is falling; let us go."

"The dew is condensing on the chilled earth, Mr. Philosopher," I said. "It only falls for poets."

"Come," said St. Clair; "I am tired."

¹ This greatest of our naturalists is since dead.

After this the talk died out, and in the shadows we wandered along the river-bank until the lights of the town appeared in lanes of red on the water and in a broad glow of luminous reflection from the sky above.

x.

SOMETIMES it happened that I saw often one or another of the three men I called friends. Vincent and I were both busy. St. Clair was at times invisible for days; was shut up with statues, or away alone on the hills or by the sea. He used to say: "Every man has need at times of a monastic life. If he cannot make one for himself, he must be a poor creature. If I were married, I should desire divorce for six months in each year."

As to Clayborne, he was always accessible, and, as I have said, Vincent alone was married. I myself had had in earlier life a great trouble. For months it had left me like one who has been near to death, and escaped. In fact, it came close to being the foolish death of all tender sentiment, of all respect for women. From this I had the wholesome logical recoil brought about by the tremendous business called war. It saved me from a fate worse than its bullets prepared for me. That Vincent and his wife knew my story helped to increase my intimacy with him. We, too, were also of the busy world of men and affairs, in which St. Clair and Clayborne had no share, the one being indifferent, the other mildly scornful. None of us were what I call ordinary men; and, indeed, Vincent used to say that, to complete our group, we needed some merely good fellow, who would represent the commonplace and commercial aspects of every-day life.

I called one morning upon Vincent on my way to the hospital. He came down to his library at once, and made me welcome with the cordiality which has so much value in a man by habit reserved and tranquil.

"Ah," said he, "since you have been away our poor iron-worker is able to move about on crutches, and is going to make a little money out of his patent. St. Clair is anywhere. As to Clayborne, he is just now writing like mad. Some fellow in Berlin says he has made grave errors in facts in that last book. You should see him; you would think the man had physically insulted him."

"And the good wife?" I said.

"Oh, well; and, by George! North, she has another young woman in training for you. Look out. It will be the woman you take in to dinner the first time you dine here."

"'Who feels the warmth escapes the fire.' Come in to-night; I have an ocean of talk dammed up for you. Come late."

"I will. I meant to see you on a professional matter; it will keep until then."

As we went through the hall, Mrs. Vincent appeared on the stair. "How lucky to catch you! How well you look! Come and dine on Friday night. You need not think about it. I say yes for you; it is settled."

Vincent smiled.

I said, "It were useless to hesitate over so implacable a fate," and went away.

That evening, late, I sat in what the American doctor calls his office, but which was for me rather a library, as the many tools my work required were kept out of view in another room. I had none of Clayborne's desire to be walled in with books. The few I loved best, a couple of hundred, were on one wall in low shelves. Another case was full of dictionaries (of which I am fond), and the walls were covered above with pictures, prints, etchings, and the hundred memorials of a life of war, travel, and varied tastes and interests.

"I want at least an hour," said Vincent, as he entered.

"Then give me first ten minutes, Fred," I said. "I have some notes to answer. I can write and talk, too, in a way."

I gave such orders as would leave us undisturbed, and went on with my work, while Vincent, putting a portfolio on the table, took a cigar and wandered about the room.

"If you really do not mind my talking —"

"Oh, no; not in the least."

"Well, if I say anything worth answering you may reply or not. You have been shifting your pictures, I see. We both have that fancy for rearrangement. I like to prowl about a man's living-room; there is a sense of animal freedom in the name he gives it,—a den,—and yours is full of the bones of things past. Few women get much character into their rooms. The very derivation of the name they bear is unamiable. I could tell that you have the taste of the savage for pronounced color, and for disorder, too."

"Go on," I said, laughing. "I shall presently have my whole biography evolved out of my surroundings. I simply loathe the precision of that table of yours."

"Yes," said Vincent; "no doubt. It would annoy me to have it otherwise, and I prefer to pamper my own feelings rather than at their cost to coddle my friend's sentiments. I am naturally selfish."

"Cold and indifferent," I went on.

"So says the world; but, really, I do not think I am. I am as tender inside as a crab, and sometimes I get into the soft-shell state, and then alas! But as for you," he added, "it is quite true that your room is characteristic, at least of your tastes—even of your sentiments."

Your table represents order amidst appearance of disorder. I should say you had trained yourself to be methodical from absolute need to be so. Also you are a hero-worshiper."

"Am I? I could wish it were more common. But," I added, dropping my pen, "I have done. You have not yet noticed the new bronze of one of my heroes." I directed his attention to a mask of Lincoln.

He stood a moment regarding it with interest. "Curious, that," he remarked. "The side face smiles; there is humor in it. That is an immense help in a serious life. It is the gentlest and wisest of critics. And the full face is grave and homely."

"Do you see any resemblance to the masks of Cromwell?"

"Faintly. And to Luther, who resembled Lincoln strongly in some ways; but the German face was coarser."

"To Lincoln," I said, "humor was both sword and shield; and yet he escaped that evil influence which for some who possess it largely makes men like Greeley absurd, or too ridiculous for charitable treatment."

"It seems to me to have been intellectually helpful to the man. Certainly it aided him to understand a people who are at once the gravest on earth and the most humorous."

"I suspect," said I, "that it plays a larger part on the stage of life, even of the largest lives, than men suppose, and, assuredly, it is a quality which asserts itself even when death is near. Its absence is fatal to some careers."

"There is none of it in this other hero of yours—in his face, at least," returned Vincent, turning to look at a noble portrait of William Harvey.

"Not in the face," I said, "nor in his life as we knew it until quite lately. But in his notes for lectures on anatomy, just published, there is plenty of it. Very early in his career, not remote from the date of Shakspeare's death, he must have been pretty surely aware of the true doctrine of the circulation of the blood, but, although he discussed it for his class, he waited many years before he put it into print. Imagine such reticent patience in these noisy days of hurry and scramble to get the last novelty into print, lest it should be found out and made public by some one else. Haste does not belong to genius. That has the patience which seems to have been assigned by nature to all forms of the creative faculty. For the gods, and for genius, time is not."

"How un-English the face is," said Vincent. "The type is that of a New England professor. The hands are badly drawn."

"No; that is the gout. The painter knew better than to manufacture hands for him. You

are right in the belief that he is one of my heroes. He had every quality I should desire. He was grave, but humorous; gentle, but courageous; magnanimous, truthful, patient, and religious; and, above all, simple. I said he had humor. Some idiots have been saying of late that Bacon wrote Shakspeare's plays. One point settled it for me. Humor is a light no man can hide. Bacon has none of it, and it is everywhere in Shakspeare."

"The point," said Vincent, "as we lawyers put it, is well taken."

"Here are Harvey's lecture notes," I went on. "The other day I reread his life by Willis. Unluckily, we know little of him, and grave text-books of science give small chance for play of humorous thought; but in these notes we catch him in a familiar hour. See how crabbed is the English hand of that day. The notes, you see, are a medley of Latin and English. He has set down headings and hints for illustrations. The humor is quaint. An acid taste rising from the stomach into the mouth reminds him of a motion from the Lower to the Upper House of Parliament—'*ventris inferni*' (nasty), he says 'yett recompensed by admiry' (admirable variety). The brain is the parlor, the stomach the kitchen, and so on. But what is it you want, Fred?"

"I want a little professional help. Last week a woman came to consult me, a slight, tall person, remarkably graceful, rather pretty, and, I may say, well-bred—a lady. She said that the case she wished to lay before me was of a criminal nature. I replied that I did not practise in the courts of criminal law.

"She returned at once, 'No, I was aware of that; but I need a gentleman, a man of my own class, and, above all, one capable of imagining as possible what seems to most men incredible.'

"I said at once, 'Sit down.' Her evident intelligence, her calmness of statement, and her pretty manners excited my sympathy. I begged her to go on. She was a better witness than most, but her story was a long one. I have condensed it into a few pages. I will read them. Make your comments, or, better, note them for discussion afterward.

"Seven years ago J. C.—, aged thirty, married a woman of twenty in a Western city. She was rich, very rich, I may say, and in person as I described her.

"J. C.—, a man of refined and scholarly tastes, a student of Oriental languages, failed in business soon after their marriage. She induced him to retire to the country, where they possessed, on a Western lake, a charming home. He was a man without other than mere intellectual tastes, slight, but healthy; refined, gentle, and of a temper generally gay. At times,

but rarely, he was subject to depression, and was never happy away from his wife and only child. In youth he had been a sleep-walker. His father died early of palsy. The father was an only child."

"A neurotic family," I said, "and two generations of one child each. Some element of weakness. Go on."

"One year ago she received a check for twenty thousand dollars, the amount of a mortgage paid off. She indorsed it over to him to enable him to arrange, in a city near by, for the payment of the only business debt he had left, and, very happy at the promised release, he left her.

"On his arrival at M——, he wrote her that he had never been more glad, and that he was about to be rid of the one burden which had troubled a life otherwise entirely happy. From that day until a month back, he was never heard of. He drew the money from the bank, paid no one, was known to have taken an East-bound train, and that was all.

"The woman's distress of mind was evident to me, but she had all of that self-control which belongs to the thoroughbred woman, and, despite her distress, was clear and exact in her statements. By and by it became only too plain that she was a deserted wife. The detectives, whom at last she employed, traced him to this city, and here lost the clue. He was gone. The case got into the papers, and was a nine-day wonder.

"Meanwhile, two months passed, and Mrs. C——, having paid his debts in full, came hither to live, with some vague hope of finding him; and now comes the second and more curious part of her story. It is almost as incredible as anything in fiction.

"After living here until July, and exhausting the powers of the police, she went one day to the post-office to ask for a letter which had been underpaid. At the general-delivery window the clerk was running over a bundle of letters, and, as she waited, threw them one by one on the window-shelf. Suddenly the handwriting on a letter caught Mrs. C——'s eye. She said, 'Is not that a letter for me?' The man said, 'Which? What letter?'

"'Oh, the last but one you threw down.'

"'Your name is?'

"She mentioned it.

"He returned, 'There is no such name in this lot.'

"She turned away, went at once to the office of the postmaster, and, simply telling her story, said she had recognized her husband's handwriting in the address of a letter. The official declined to allow her to inspect the letters. But at last she so satisfied him as to herself and her object that he sent for the clerk, and allowed

him to run over the letters in question while she looked on.

"Presently she said, 'There! He wrote that address.' It was Mrs. Louis Wilson, No. 422 Blank street. The official of course declined to do more; nor did she insist, being clear-headed enough to be satisfied with the clue. Then she went back to her detectives, and in a week or two knew all that there was to know. Here is the report.

"Six months ago a man took a small house—No. 422 Blank street. He was presumed to be married. The man was roughly dressed and careless in person; had some business occupation as a clerk in a dry-goods house; known there as a good worker and punctual, but slovenly as to dress, and unpopular by reason of an abrupt temper and general lack of social qualities. Traced back to a small hotel where he had once lived. Was believed to have married one of the maids—a rough, good-natured, common woman older than he; was now on a week's vacation at the shore. Name, Louis Wilson. Home habits of life unknown. Might drink at times, as he occasionally frequented a tavern near by.

"After this Mrs. C—— easily contrived to see the man. She is sure it is her husband. Her own force and intelligence are shown by the fact that she did not speak to him, and it is certain that there is some mystery back of it all. Lastly, she comes to me."

"Well," said I.

"Oh, I could, of course, fasten on him; prove bigamy; punish him; free her; or pay off the woman in possession. By the way, he is certainly married; that I learned to-day. As against either course there is much to be urged, and to neither course does Mrs. C—— consent."

"And what does she want?"

"Nothing yet. She insists that the whole affair is incredible under any assumption of sanity on the part of C——. How does it look to you?"

"If all she says be true, the man is not insane."

"No. I have seen his employer; you know him, I fancy. I was able to learn from him all I wanted to hear without alarming the man C——. He is unsociable and even morose; ill dressed, even uncleanly, so that he has been told that he must be neater. He is said to be clear-headed, punctual, and accurate."

"All that might be, and yet he might have left her under some delusion of which there had been no warning."

"Well, it seems unlikely, and, let me add, Mrs. C——'s people I find are known to me. You may rest assured as to her intelligent truthfulness, and even as to her accuracy. I

wired Mr. R——, in M——, and now know all about her. What do you think? and is it a case for a doctor? I myself am secure only as to this not being an example of mere vulgar desertion."

"No; there we are at one."

"Mr. S——, his employer, has arranged to send C—— to me with a letter to-morrow at eleven; Mr. C—— to wait for an answer. Could you meet us?"

"Yes; I should like to. Let us adjourn further consideration of the matter until then."

The next day I was talking to Vincent when Mr. C—— came in. Vincent said to me, "Sit down, Doctor, please, until I answer this note." While he wrote I studied C——. He was dressed carelessly; cuffs and collar soiled; hair unkempt; nails uncared for. Nevertheless, his facial lines were refined, if not strong, and both hands and feet were of delicate make. He sat in quiet, apparently a stolid, indifferent man.

At last Vincent looked up as he inclosed his reply, and said: "I have asked Mr. S—— to name a man who can do accurately a large amount of copying from notes of testimony. It needs care to decipher two or three bad hand-writings. Once in clear shape, I can have it type-written. He says you can do it."

"Yes, I can; but I am slow. I could take it home. I would be glad to do it."

As C—— spoke I observed that it was with slowness and as if unsure of his words.

Vincent went on, "Will you let me see your writing?"

"I will bring some to-morrow. I write slowly."

"You speak a little like a foreigner." And then carelessly, "Where were you born?"

C—— looked at him, hesitated a moment, and said, "I don't know."

"None of us do," returned Vincent in his gentlest manner. "But where were you brought up? Are you an American?"

"I do not know; I kind of don't know. I must have been sick; I don't remember rightly."

The language and the tones were unrefined. Evident embarrassment was in the speaker's face, and he moved uneasily.

"Try to think," said Vincent, kindly. "When one employs a man, it is desirable to know a little about him."

"Yes, sir; I see"; and he was silent.

"Where does your memory fail you?"

"About seven months ago."

"And before that all is a blank," said I, abruptly.

C—— turned to answer me, troubled as I could see, but with no sign of alarm or anger.

"Yes; I think that is it. I don't go back any more than if I was born seven months ago. I

can't make it out; sometimes I am unhappy about it."

"Could you tell how you got here?"

"Yes; on the railroad from M——."

"Could you write and read when you came hither?"

"That is a strange question, sir. I could speak. I speak badly. I must have been sick. I speak better now. I could not write my name in the hotel book. The clerk said that was queer, but I told him my name. He wrote it. In a few weeks I tried to write; at first I wrote from right to left, but I learned soon. I must have had a fever."

As he spoke, he became less disturbed and more interested. Then pausing, he added, "Why do you ask me? It quite bothers me."

Ignoring his query, I went on. "You came hither from M——, you say. Did you ever know a Mr. J. C——? You quite resemble him."

"No; never heard of such a man."

"An Oriental scholar. Student of Sanskrit, and so on."

"What's Sanskrit?" he replied. "Never heard of that either."

At this moment Vincent rose, with a glance at me, and saying, "Wait a moment, Mr. Wilson, I will get a few pages of the notes. You may copy them, and let me see to-morrow how you get on. Then we can arrange as to terms."

So saying, he passed us and went into the outer room; was gone a minute or two and returned, followed by Mrs. C——. Her dignity of carriage and extraordinary calmness overwhelmed me with amazement. She looked at C——, flushed, and, drawing back a chair, as women do when about to sit down, adjusted her skirts, and took a seat.

Instantly turned to watch C——. Not a sign betrayed memory of the woman.

"Mrs. C——," said Vincent, "my friend Doctor North." I bowed. "Mrs. C——'s difficulty I have already mentioned," continued Vincent. "She has as yet no news of her husband, and, by the way, Mr. Wilson here is a Western man, Mrs. C——. I ventured on the mere chance of a clue to ask him if he ever heard of Mr. C——. I think you said no."

"Never heard of any such man."

I saw a change go over the woman's face; it was almost too severe a trial. The muscles of her chin twitched. She was silent for a moment, and then said, with evident effort, "You look like Mr. C——"; and, rising, "you might be he. I am his wife."

The clerk smiled. "Well, I am Louis Wilson, and have a wife of my own."

I saw Vincent touch his lips with his finger

as she turned toward him. At once her remarkable self-control asserted itself.

"Excuse me," she said; "I must go. Pray send me the title-deeds, Mr. Vincent. I really must go. Good morning," and went out.

"My clerk has the notes ready, Mr. Wilson," said Vincent; "you need not wait here—in the outer room, please." And then the lawyer and I were alone. "What now?" said he.

"It is a case of what is called double consciousness. This man abruptly lost all memory of his life and its events—that is, of people, of things, not of words; probably of all written signs. Most habits must have remained, but as to this we do not know. The intellect was not altered. He was able rapidly to reacquire a new store of guiding, useful remembrances, and to learn to write. In a case I know of there was this same tendency to write to the left."

"He knew Hebrew; did it not come from that?"

"No," I said. "The other case was that of a half-educated country girl."

"When," returned Vincent, "he came to the H—— House here, he was like a rough, ignorant child, and was alarmed when addressed by a stranger. The chambermaid said he must have been ill. After a while she learned that he had money. He seemed able to count it, but for a long while could not understand what a bank was. The landlord, an honest German, took an interest in him, and finally induced him to deposit the money in a bank. His intellectual appreciation of things returned with great rapidity, and now you see what he is."

"Yes; it seems incredible. These cases are rarely seen in their abnormal state; that is the difficulty. Of this I am sure, the loss of memory of people, of animals, of places, is absolute; of language the loss is incomplete; of writing, entire. But the reacquired writing is identical as to the forms of the letters with what has been lost; you will be able to verify that with ease. Strangest of all is the change of character, of tastes, of manners. In one instance a sad, morbidly religious person became gay, vivacious, ignorant of religion, fond of jokes, and at last wrote queer doggerel verses, and for years oscillated from one state to the other; ignorant in state *A* of all that belonged to or had been learned in state *B*, and vice versa. It is a long story, and in print. I need not go on. The case ended by her remaining in the abnormal state. She was gradually sobered as time went on, and as she acquired information through others as to her former condition. She finally became a pleasant, useful person, and lived for twenty-five years a happy, active life as a teacher."

"Then," remarked Vincent, "like this man,

she was, at different periods, two distinct people, with quite opposite characteristics?"

"Yes."

"And irresponsible in one state for the crime or folly of the other?"

"Yes; like this man. Some people explain these strange facts by our having two hemispheres in the brain; but the power to write and to speak are the function only of the left side of the brain, and speech is lost but in part, and writing altogether, or not at all in other instances. I see no explanation. Whatever be the cause, it is such as may disappear and reappear in a minute."

"And this may happen here in this case?"

"Or may not; and there is nothing to be done."

"How horrible! And what do you advise?"

"If we tell him the truth, and prove it, there is the woman, his present wife, against us. Of course it will be hard to influence a man in his mental state—commonplace, satisfied—careless, at least. With the woman against us, we shall have a suit for bigamy, and to go into court with the defense of double consciousness would be useless."

"I see it all. If Mrs. C—— will have the sense to wait, time may settle it. I see no other resource."

When Mrs. C—— heard our opinion she was inclined to make a further effort, but at last, on being assured that C—— would be well watched, concluded to await the result in her old home.

To conclude this story, I may add that just four months later C—— appeared suddenly in her house in great perplexity and terribly disturbed. He had not a trace of remembrance of the past eleven months. He recalled the fact that he had gone to the bank in M——, and there his recollection failed. The new life, the novel employment, the locality he had lived in, the new wife, were for him as though they had never been. His rough dress surprised him. He was once more the quiet, well-bred, sensitive scholar.

He declared that one day he was walking in L street in this city, when, abruptly, he was astounded and bewildered by the strangeness and unfamiliarity of the surroundings. He asked some one where he was. The second wife and home were as things dead to memory. He said to himself that he must have been ill. He went into a hotel, got a paper, saw that eleven months were a blank to him, and, asking his way to the station, went at once to his former dwelling-place.

Mrs. C—— adds that his ways, manners, tastes seem to be as they once were. At first he was somewhat dazed, but by degrees im-

proved in health, and reassumed his studies. In answer to his uneasy questions as to his presumed illness and long loss of memory, she was able to say that vain efforts had been made to find him. At last he showed a strong disinclination to hear his former mysterious condition referred to, not a rare peculiarity in persons who have had his disorder. Now she proposes to go to the East and travel in Oriental countries, a plan which in every way suits him.

Of the sum he took from home about two thousand dollars remained in the bank, and as to this we were embarrassed. He could not draw it out as J. C——, and he could not as Louis Wilson. It was decided to sacrifice it. To this day no one knows what became of the remainder of the money he had originally deposited. It had been drawn upon during his life here in large amounts, and Vincent had reason to think was lost in foolish stock speculations.

Mrs. C——, a just and generous woman, settled on the ex-wife a sum competent to support her. She was told that Wilson was disordered in mind and already married, and that she herself would enjoy her income so long as she took no steps to solve the mystery, or to discover her lost husband. She agreed to this, and the C——s will remain for years in the East.

"It is well done," said I. "I wonder how many of the incomprehensible disappearances depend upon a state of mind similar to C——'s. The more one considers it, the more bewildering does it seem. Are we all of us 'two single gentlemen rolled into one'? However, some day we will talk it over again, and ask me, too, about the cases of insanity where a man is conscious of two personalities in his own being, and converses for both."

"I shall not forget. Are there ever three?"

"No; I believe not."

XI.

SUNDAY was, both of choice and of necessity, the day when we were apt to make holiday together. The matchless weather of early November was also a temptation to be out of doors, and the wide hospitality of the park assured us of comparative solitude. And now it was an hour before set of sun, and about us the margin of a great wood, with a deep stillness in the cool autumn air, through which the leaves fell lazily, drifting earthward one by one. Far away below us many people lay on the slopes, quietly enjoying the rest and the sunlit river gay with boats.

On the forest verge, and in and out, St. Clair walked, his cap in his hand, and kicked the

rustling leaves as he went, pleased like a child with the noise and with their colors.

It was rarely that Clayborne could be made to join our walking-parties. He hated exercise, affirming it to be needless for health, illustrating his theory by his own example of perfect soundness. He, too, as he lay and watched the distant carriages and the quiet enjoyment of the groups below us, amused himself by stirring up the drifted leaves with his stick. At last he turned to Vincent. "I sometimes wish," said he, "that men were like books, so that one could take them down from a shelf and read them at will."

"And then put them back when you have had enough," returned Vincent. "But then, my books are men, and they do vastly entertain me on the whole, and vary from day to day, which your tedious volumes do not."

"Oh, don't they?" cried Clayborne.

"By George!" said St. Clair. "This is the first time in my life I ever agreed with you. Vincent thinks books are just mere changeless things. My books, at least, do alter. I have suspected them of moving about on the shelves, and of course their dress, their associations, affect their power over men. Do not a man's clothes influence your estimate of him?"

"What do you mean?" cried Vincent, pretending not to understand.

"And," added St. Clair, "would you as lief read a paper-bound Leipsic 'Horace' as my Elzevir, with the thumb-marks of Sir Thomas Browne? Would it be the same to you?"

"Why not?" said Vincent. "The book is the book, that is all. Nonsense! The print should be clear, and the volume clean. I ask no more. Go on."

"Oh, we could fit all this truth to the books you call men," said St. Clair. "North has a little old Huguenot Bible. On its dainty binding are the signs of long and reverent use. It has the psalms for those who are about to go into battle, and for such as are condemned to the ax. It is just about the date of the massacre of St. Bartholomew. Is n't it, North?"

"Yes," I answered; "and when it came to me there was in it a rose faded gray."

"Oh," continued St. Clair, "and I know of a little volume of Shakspeare which is faintly smirched here and there with the touch of fingertips, now dark-red. It belonged to Keats, and as you all know how he died, you may know what were these red stains."

"And," said Clayborne, "in the great French library there is that rare book, the 'De Trinitatis Erroribus' of Servetus. Calvin burned him and his books, and it is thought, and I like to believe, that the slight marks of fire on this copy are evidence that it was rescued

by some disciple, who came at nightfall to grieve where the smoldering ashes lay."

"Thanks," said St. Clair, simply. "That is a thing to make one think. Would you mind my using that little poem?"

"Poem! Who! I! What!" cried Clayborne.

"Yes. What a tragedy!" And the poet slowly moved aside into the verge of the woodland.

"I, too, have a book," I said, "which is to me strangely interesting. It is the copy of his 'De Generatione,' which William Harvey gave to one Francis Bernard, a London doctor. Men do not seem, in those days, to have inscribed their names in presentation copies. It is a modern fashion, I suspect. But this Bernard is clearly aware of the honor done him. He writes on a blank leaf, 'Donum Eruditissimi et Perspicacissimi Autoris, May 1, 1651.'"

"And why did you chance to say, Clayborne, that you wished men were like books? Why, just *now*, I mean?" said Vincent.

"I had a woman's curiosity about these people on the hillside. I wanted to see their table of contents. They seemed to me, as we walked among them, to be chiefly Americans—mechanics I take it mostly, a class I never can get near to—in talk, I mean. Men of business, professional folks, the people of our own class, seem transparent enough."

Vincent smiled at me furtively. Clayborne was a bad judge of living character. His intelligence was, indeed, of a rare order of excellence. His lack of sympathy was complete, and sympathy is one of the keys to character.

"The trouble lies with you," I said. "No men are so approachable nor so often interesting as our own mechanics. All the lower classes in England are struck shy at once when a stranger of a class above them attempts to engage them in easy talk. It is not so with our people. Their sense of difference of social position is of other quality than that of the Englishman. The ups and downs of life are vast and common with us, and everywhere is growing a wholesome sense of the fact that the form of labor does not degrade—that at least it need not."

"The more the people think that, the less it will degrade," said St. Clair. "But there will always remain the influential effect of occupations."

"Let us clear our heads," said Clayborne, "as to what we mean by degradation."

"I mean," said Vincent, "or you mean, I fancy, that there are occupations which cut men off from social relations with refined people, or shall we say with the class in which are found the best manners? No need to discuss the value of these."

"Well, then," said St. Clair, "accept that; and now if you were to name the occupations

which socially disqualify to-day, you would find them fewer than they were even fifty years ago."

"True, quite true," said Clayborne. "Let us each make a personal list of the occupations which we think ought to disqualify for the best social life. Mine would amaze you. I have not the courage to state it. But go on, my little saint. You are doing it well. I never knew you half so definite before."

"Confound his impudence!" cried the poet, pleased nevertheless to be praised. "There was a time when to be a business man in some Southern cities was a social degradation. It is not so now. Compare the position of a teacher to what it once was. See how the poorer students of New England colleges may work in summer as waiters at hotels and go back to their studies socially uninjured. I must have told you before of the amazement of an Oxford Fellow when a waiter in the White Mountains, overhearing me speak at supper of my difficulty with a passage in an old Italian life of Galileo, offered to translate it."

"When a man's occupation, if it does not make him physically unpleasant, ceases to put social barriers in his way, you think that we shall have attained the right thing. Is that it?" said Vincent.

"Yes," I answered.

"But now it does make him socially impossible, sometimes. How can the manners of a dry-goods retailing clerk ever be—"

"As yours," I said, laughing.

"Well, if you like, yes." And then, gaily, "But it would have been better manners to have left my manners out of the question."

"Oh, we need a standard," I said. "The clerk's manners do now disqualify. They need not continue to do so."

"I doubt it," said Vincent. "And yet in some New England towns the standard of manners and of cultivation is much nearer alike in all occupations than in our cities, and is not bad by any means. However, it is a long question to discuss here."

"I don't quite agree with you," said St. Clair. "I rather think that mere manners are essentially and invariably modified by what a man's work is. It ought not to be so, but it is. I hold a lease of my studio from an undertaker. Now and then he comes in to see me as to rent, or repairs, or what not. I perfectly loathe that man. His manners are subdued, like the dyer's hands, to what he deals in; he talks under his breath. He is always composing himself into attitudes of constrained sobriety. He pays you the same lugubrious attention he gives to a corpse. When he comes into a room it is always head first, and he seems to me to crawl around the half-opened door with cautious

quietness. My workman calls him 'the measuring-worm.'"

"A cheerful person," said Vincent. "But St. Clair has proved his point."

"No; only illustrated his thesis," I returned. "Your undertaker reminds me of a jest which ought to be preserved. St. Clair's landlord—the 'ghoul,' we used to call him—once consulted a friend of mine. The doctor said, 'You seem to have something on your mind, Mr. Maw.'"

"I have, sir. Whenever I feel ill,—and I am getting on in years,—I am saddened by the reflection that possibly my own funeral obsequies will be conducted with less orderly decorum than if I were here to superintend them."

"That is immense!" cried St. Clair. "I beg pardon; go on."

"The doctor replied, 'Well, Mr. Maw, why not have a rehearsal?'"

"That seems reasonable," said Clayborne, gravely. "But where on earth is the fun?"

This nearly crippled the party for further talk, but after some moments Vincent said, "Suppose we drop the undertaker, and—"

"Horrible word in its literalness," broke in St. Clair.

"Yes; bury him," I said. "Go on, Vincent."

"I was only about to take up the broken threads of our chat. There is the clerical manner, with its habit of exhortative inflections, very droll when astray in the commonplaces of everyday life. And the doctor manner—"

"Mine, for example?"

"Well, sometimes."

"Thanks; I shall remember that."

"The question," Vincent went on, "is whether any business must always of need so affect a man's manners and ways as to cut him off from the social life of men so favored by fortune, inherited qualities, and education as to demand a certain standard. Do I put it fairly?"

"Yes," said Clayborne.

"Well," I said, "we must admit, I think, that all work has its influence on character, and on what makes for or against social charm. Are not these influences in some businesses too potent for evil to admit of their being overcome? It would be a vast gain to feel that merely because you do this or that you are not set aside as of a class to which certain avenues are closed. That alone injures, as St. Clair said, and is competent to affect both character and manners. I was told once in a great city of Europe that I would find it pleasant to be received in a certain class of society, but that it would be impossible while I continued to call myself doctor on my card. 'Of course,' said the friend who desired for me this privilege, 'my doctor does not dine with me.' And the man she named was a physician of European celebrity. He was not excluded because he was ill-bred,

but because it was silently accepted as a fact that he could not be well-bred. I affirm that this alone is injurious in a measure, and leads to his being just what they despotically affirm him to be."

"Yes," said Clayborne; "however much a man may struggle against the social peculiarities of his class, in the end he will be apt to suffer defeat. Now as to the doctors."

"As to them," I urged, "let me say a word. Every occupation has its influence on character, be that what it may. My own profession is full of temptations to yield to little meannesses. It is a constant trial of temper. It offers ample chance to win in retail ways by disparagement of others, and by flattery and appearance of interest where little is felt. The small man—what I may call the retail nature—gives way to these temptations; the nobler nature strengthens in resisting them. A doctor's life-work is the best education for the best characters. It is of the worst for the small of soul."

"Let us return to St. Clair's dictum," said Vincent. "I think it was that no general reverence for his mode of work, and no example, and no desire on his part, could ever make an undertaker socially endurable."

"Oh, sentiment comes in there," said I, "and that is inexorable. But to-day we have false lines for social boundaries. There is no sentiment in the way as to the mechanic. Make it only a question of manners, and leave that to him, but let us stand up for the American idea. It is the business of every man to see that his work in life does not put into his character anything which lessens his powers to please and be pleased in right ways."

"And that was what your screed about doctors meant," said Vincent. "You are an abominably sensitive breed. You abuse yourselves, but allow no one else to do so."

"Yes; I hardly know why, except that gilds are generally sensitive, and ours is a world-wide gild, and the only one. The world over we keep touch of one another, claim constantly of one another unrequited service, and abide by a creed of morals old when Christ was born."

"When you got off on to the doctors," said St. Clair, "I was about to ask you not to forget your promise to tell us about your friend the character doctor."

"That is a new trade," said Vincent.

"I will not forget it," I returned.

"Good!" said Clayborne. "But all this fuss about character is rather amusing. I don't think I ever took much pains with mine."

"Nor I," cried St. Clair.

"Nonsense!" I replied. "If not, then you had better begin."

"Did you ever hear the Russian account of

the moral tontine?" said Clayborne. "I translated it for amusement when I was learning Russian. I can read it to you some time, if you like. It shows how a fellow may acquire too much character."

"I should like to hear that. Let's have it next Sunday night at Vincent's. And now, suppose we walk home along the drive; I like to see the people."

"Oh, anywhere," grumbled Clayborne, "if you will leave alone my poor little character, as the servant-girls say; it is all I have. It satisfies me, and I have no respect for you people who have to send your characters to the wash every week."

"Mine needs it," said Vincent, "and — well, there really are folks who like paper collars."

"I hardly understand your very indistinct allusion," said Clayborne; "I have worn paper collars myself on a journey. I consider their inventor a benefactor to — to so much of the race as wears collars."

"And I," said St. Clair, "would like to introduce the custom of erecting statues to what I call the negative benefactors of mankind, the people who invent tomato-cans, telegraph-poles, or paper collars. Oh, I could write the inscriptions too. This monument is erected by an injured public to preserve for eternal detestation the memory of Blank, Esq., who invented a new means of desecrating the beautiful in nature."

"We will all subscribe," I said, laughing.

"Oh, yes; you may laugh, but, think of this. To be alone with a friend in the forests of Maine. About you the moss-grown trunks of a windfall's ravage a century old. At last, you say, here no foot of man has been. Your friend points to a soiled paper collar at your feet. There are some crimes I could more easily condone than certain vulgarities, and the worst of it is that you get used to these horrors."

"Pshaw!" exclaimed Clayborne. "You really don't mean what you were saying. Would a bit of newspaper have offended your sensibilities?"

"Yes; it would. The American newspaper editor would have one of my tallest negative statues."

"That is rather too bad," exclaimed Clayborne, falling behind with the poet while Vincent and I went down the hill together.

"Clayborne's incapacity to see fun in any shape is exasperating," said I. "I consider it a real annoyance at times."

"Why?"

"Oh, I mean if we are alone together. It limits talk, and to have to keep too close watch on what you say is fatal to reasonable human intercourse. Imagine yourself, when with a charming young woman, being asked every five

minutes to explain your intentions. Clayborne is every whit as bad as that."

"Who is the man yonder?" said Vincent.

We were now near the drive, and about us were the serious but not discontented faces of well-clad people, chiefly Americans, and not a few Germans. The drive was in a remote portion of the park, and was scarcely watched by the guards, so that on it a few men were speeding their fast horses, amidst critical comments on the trotters by the groups on the grassy slope. Presently came at lawless speed a perfect pair of Morgans. Behind them, in a light wagon, sat a stout, red-faced man, smoking as if it were a duty to make his fairy-like equipage seem a steam-engine. He looked straight ahead at the road.

"Who?" I said in answer. "That is Mr. O—. That pair is worth — well, the value of your house. The man has this one pleasure in life. He runs horses, but never bets. He says that ain't business. He has accumulated a fabulous fortune from a patent he took for a bad debt. I happen to know him pretty well. He rises at six, breakfasts alone, reads swiftly two or more papers, is at work by eight o'clock, dines standing at a restaurant counter at noon, leaves work at four, drives until seven, eats supper, plays a little euchre twice a week at his club, or else reads a newspaper until ten, and goes to bed. Also, he is a bachelor and is clean shaven."

"Well, that is the outside — the natural history. What of the physiology?"

"He has a small house, lives plainly, has his one extravagance, — fast horses, — and never gives away a dollar."

"The man has then neither vices nor virtues."

"Yes, Vincent," I returned; "he has the courage of his convictions, like other hardened thieves."

"And does not the sentence of a kindlier world on such as he touch him at times?"

"Never, I fear. I once went to put before him the needs of a great charity. He heard me patiently, and then said: 'I object to doing that which I am taxed for, and, besides, I am unable to give away money. I cannot do it. Other people can. I can't do it.'"

"And that was all?"

"Yes; almost all. He asked me to smoke, saying the cigars cost half a dollar apiece. I laughed, and said, 'How can you be willing to give me a half-dollar?'"

"That's true," said he; "but it is n't money. There's something darned queer about money. I'll leave your hospital something in my will, but I won't give you a cent."

"The being you describe seems to me incredible."

"Oh, here are the others." And we went down to the river, and walked homeward.

"And there is another horror," said St. Clair, pointing to the hideous collection of white marble tombstones on the further side. We could but agree.

"Yet," said Vincent, "even a modern graveyard can be made a fitting thing. Near a Western town a man gave a fine old wood as a cemetery, with the condition that small spaces might be cleared; that no gravestones should be other than gray; that none should rise over three or four inches from the earth, and that the boundary-lines of ownerships should be marked only in the same way. Flowers and vines might be planted, but no tall monuments or iron fences were allowed. I am told that it was most solemn and beautiful."

"And," said Clayborne, "yonder mass of the dead must drain into the river from which men drink."

"Mother Earth is a great purifier," I remarked; "but the idea is certainly unpleasant. My friend W—— says it accounts for the conservatism of this great city."

"How?" said Clayborne.

"Oh, don't tell him," cried St. Clair, laughing. "Don't. It is a riddle."

"I hate riddles," said Clayborne.

"But there is tremendous wisdom in this one," said Vincent. "It is a question of hygiene—how to separate purity from impurity."

Clayborne walked along in silence, while we chatted gaily. He was apt to keep an idea in his mind long after the talk had drifted away from it, so that half an hour later we were not surprised to hear him say: "I think I see it now. How curious! But it is an argument as well as a jest."

S. Weir Mitchell.

GENIUS WITHIN HEARING OF DEATH.

WHAT is the look the miser gives his gold
 When first he hears Death coming? What the look
 The lover, newly plighted, gives his love
 When first he knows how few more looks are his?
 And what the gaze the husband gives the wife
 When Death stands ready to divorce the two?
 Ay, such a look has some one cast just now,
 Nor yet the same. *Those* feel the bitterness
 Of leaving what is loved so far behind,
 Of taking with them but the love of it;
 But *he*, the pang of taking *with* him *all* his wealth.
 Right through his heart a fierce pain tore its way,
 And when his breath dared come and go again,
 How softly, fearfully, it came and went!
 With what an awful tremor in its haste!
 For Death seemed whispering at few paces off.

The shining of the gold shows Death the ghastlier,
 The tender voice of Love makes his the hollower.
 When Genius feels divineness in her power,
 When hope of fame is growing strong and fair,
 What nameless anguish in the sound of Death!
 What though the soul shall take her powers hence?
 That eyes and ears and hands must now forego
 Forever the happy work of waiting upon her,
 Is grudged in pain too hard to melt in tears
 Or to be molded into any words.
 With rising faith, and hope of Heaven so near,
 Contends the sorrow for these unborn things
 That swell the soul so, urgent for the light.
 Conceived on earth, they long for birth below,
 And pressing on the soul, give such a pang
 As she must have who, knowing she must die,
 Feels that what would be life must die with her;
 That she must lose her earthly motherhood,
 Nor this alone—but leave no voice behind.

Charlotte Fiske Bates.

ENGRAVED BY T. COLE, FROM THE PAINTING IN THE UFFIZI.

“KNIGHT OF MALTA,” BY GIORGIONE.

ITALIAN OLD MASTERS.

GIORGIONE.—1477-1511.

(GIORGIO BARBARELLI.)

F the painter who in his own time, or at least in the years immediately succeeding his death, was reckoned the most brilliant of his school and generation, we know so little by actual record of his life, and even have so little of his work authenticated satisfactorily, that he appears only as a splendid reflection of his contemporary renown. Of the numerous pictures attributed to him in the various galleries of Europe, and the few still in churches in Italy claimed for him by local tradition, there is only one of which the authorship rests on secure evidence. This is the Madonna of the church of his native place, Castelfranco. With regard to all others there is the dispute of an interminable doctorate, and the greatest part by far of the so-called Giorgiones are, by the best of the writers on Italian art, Cavalcaselle, relegated to others of the Venetian school, his followers or imitators. The determining of the Giorgionesque standard is, therefore, one of the generalizations in which the largest range of study of the painting of the epoch and the most minute knowledge of the technical characters of it are necessary, and these acquirements are too rare to be admitted to self-assertion. I have them not; and, so far as I can follow the writers on Italian art, Cavalcaselle seems to me the only one who has a right to be considered as a definite authority.¹ He gives a list which is probably as nearly correct as we are likely to get, and which restores the authorship of at least three fourths of the attributed Giorgiones to their actual painters. The record is stupefying, not only as showing how little the critical world had studied the question, but for the data of works known to have been painted by Giorgione and of which no trace can now be found. But the Castelfranco picture, restored as it has been repeatedly, is still, so far as its general characteristics are concerned, and the characteristics of its landscape especially, distinctly enough individualized to permit one to say that though Giorgione has the reputation of being the master of Titian, he is far more certainly the pupil of Bellini, in

whose work are clearly the roots of all that either Titian or Giorgione has done.

We do not know certainly when Giorgione was born. Vasari says in 1477, but Cavalcaselle says that he was certainly born before that year, Titian having been born in 1480 according to Vasari, and in 1477 to Ridolfi. What is probably indisputable is that the two were nearly of the same age and were at the same time in the studio of Giovanni Bellini, where the precocity of Giorgione was such as to impress on his time the idea that he led Titian in art, and that Titian went into his studio after leaving that of Bellini—a version of their relations which, with all deference to Cavalcaselle, who accepts it, I do not recognize as having a sufficient basis of authority either in what we know of their art or in what we have of tradition. In the work which they did together on the Fondaco in Venice, the purely decorative element of chief importance may, as I have said in the sketch of Titian, have taken, in the precocious manner of Giorgione, so great a predominance that, from the perception of something new in the function of color decoration as seen in his work, Titian was led to adopt it and to emulate his fellow-student in the employment of broad masses of color without much attention to the drawing and rendering of detail. This method of securing a decorative effect is what the description of Vasari would lead us to consider the Giorgionesque ideal of wall-painting for exteriors, and thus to have given rise to the tradition that Titian adopted the style of his companion; but that the style of Titian in his mature and indisputable work has any trace of derivation from that of Giorgione as seen in the Castelfranco picture, or is anything but the logical derivation from the work and example of Giovanni Bellini, I am not disposed to admit. If Giorgione taught Titian, he also taught Bellini before Titian, for the manner of the latter is only the enlargement and liberation of that of the master from whom the two pupils took all that they have in common.

Castelfranco is a little city of the plain of Treviso, as unlike Cadore, Titian's birthplace, as one spot in Italy can be unlike another; and as in Titian's pictures the hills about the road from Cadore to Venice give a type to the backgrounds of his pictures, so the alluvial plain

¹ Morelli seems to me curiously fantastic in his attribution of pictures to Giorgione, and most of the German commentators are scarcely more secure.

ENGRAVED BY T. COLE, FROM THE PAINTING IN THE CATHEDRAL OF CASTELFRANCO.

ST. LIBERALIS, FROM THE "MADONNA AND CHILD ENTHRONED," BY GIORGIONE.

of Castelfranco, to a certain extent, might be expected to furnish the clue to the authorship of Giorgione's pictures. Cavalcaselle in several cases points out the nature of the landscape as testimony of the authorship of the composition; but in the Castelfranco picture, curiously enough, the background, a delicious bit of sunshine and space, is a scene on the sea-coast, and does not in the least resemble anything in the vicinity of Castelfranco. The family of Barbarelli was one of importance in the country, but Giorgio was an illegitimate son of one of them by a peasant girl, and was recognized by the family only when his glory as a painter had made him an honor to it; and in an epitaph of the old church, preserved only in contemporary documents, the painter is recorded with two of his seniors, in 1638, not the date of his death, but that at which his reputation had induced the family to admit his relation to it. This, with the fact that he died of plague in 1511, is all that we know of the facts of his life, except those which belong to his artistic existence. Tradition reports that he died of grief at the infidelity of his mistress, who deserted him for his disciple Luzzi; but a grief that had to be assisted by the plague in order to kill its victim may be considered at least apocryphal. That he died of sensual excesses is another tradition to be shunted off the track of historical research, for the traditions so far

as they are positive, and all the early authorities, agree that he died of plague.

Of the other pictures which are accepted by all the critics, and as to which Cavalcaselle makes no question, the chief, after the Madonna of Castelfranco, is "The Concert" of the Pitti Gallery, Florence. The rival subject of the Louvre is attributed by Cavalcaselle to a follower of Sebastiano del Piombo. In one of my first visits to Venice I remember seeing a fragment of one of the frescos of Giorgione on the Fondaco, but I believe it has now utterly perished; it was then only a shadow. Zanetti, an early author, speaking of these frescos, says that he finds admirable in Giorgione the quickness and resolution with which action is rendered, the artifice with which light and shade are broken, blended, and distributed; but in Titian's work he admires the firmness and strength of the half-tones, the simplicity of contrasts, the tenderness of flesh-tints, and the moderation which avoids the fire of Giorgione, while it abstains from dark shadows and exaggerated redness of the flesh. This proves at least that Titian was not an imitator of Giorgione in the particular work as to which the adoption of Giorgione's style by Titian was affirmed, and strengthens my distrust of the judgment formulated by Vasari, that Titian ever became the pupil or follower of Giorgione.

W. J. Stillman.

NOTES BY TIMOTHY COLE.

ONE of the finest and most magnificent conceptions of a half-length portrait is seen in the "Knight of Malta." It hangs in the Uffizi, is painted on canvas, life-size, and is rich and glowing in color.

June 4, 1891.—At Uffizi as usual, at work on the "Knight of Malta." What an inspiration to have so fine a thing at one's elbow to gaze upon from time to time! How glaring are the retouchings of the restorer! What a heavy-handed bungler he must have been! Giorgione floats his hair into the flesh in the most refined manner imaginable; but here are retouchings that look as though the restorer used the blunt end of a stick with which to put on the color.

June 9.—What an air of magnanimity and true greatness breathes from this canvas! No other artist knows better than Giorgione how to captivate the mind and to hold the imagination with so few means. Here is a man holding a string of beads. I hear some Americans behind me exclaim, "Here's a grand head!" How it puts to shame all petty worrying and narrow-mindedness! There is something Christ-like about it in its calm benignity. Now I vow I will endeavor to aim at greater simplicity and nobleness in my living—to think of the "Knight of Malta," to put away all meanness and triviality by a thought of the "Knight of Malta."

The detail of St. Liberalis is taken from Giorgione's famous altar-piece of the "Madonna and Child Enthroned," in the choir of the cathedral of Castelfranco. The entire picture measures six feet six inches in height

by four feet ten inches in width, and is painted on wood. The Virgin, with the Child in her lap, sits enthroned upon a high pedestal above the middle of the picture, and a charming landscape stretches away from her. Beneath her, one at each side of the pedestal, stand St. Francis and St. Liberalis, the latter clad in shining armor, and holding a flag. It is this figure which forms the detail engraved. Part of the flagstaff is seen. These figures are separated from the background by a wall on each side of the pedestal, which appears to be covered smoothly with red velvet, very rich and deep in color. The pedestal rises just above the heads of the figures, and forms a fine relief to the gray habit of the monk and the burnished steel of the knight; no doubt, too, it contributes much to the soft, airy feeling of the lovely, quiet landscape. The Virgin above, sweet and serene, gazes down abstractedly. Instead of the conventional red and blue, she is clad in green and red—charming, rich, and harmonious colors. The Child, too, looks down thoughtfully. The flesh-tints of both are warm and mellow, and contrast delightfully with their draperies. A rich green embroidered tapestry falls from beneath the Virgin over the warm gray marble of the pedestal. The plinth of the pedestal is of a warm neutral purplish tone, upon which, in a circle of light, warm marble, are sculptured the arms of the family—the Constanzi—for whom the picture was painted. The floor is checkered with gray and light, warm marble. This is the least satisfactory portion of the picture. According to Crowe

and Cavalcaselle, the painting has been restored on several occasions. G. G. Lorenzi went so far as to paint a beard to St. Liberalis. Paolo Fabris of Venice removed the beard and many of the oldest repaints.

St. Liberalis is patron of Castelfranco and Treviso. He is usually shown as clad in armor, young, with flowing locks, and his attribute is the flag—red, with large white cross, and sometimes with four white stars at each corner of the flag.

The St. Liberalis of this picture is said to be the portrait of a young man of the Constanzi family who died in battle, and this picture was dedicated to the Madonna in his memory. His tomb is seen in the churchyard adjoining the cathedral, and, although much worn by the elements, his effigy still resembles the figure in the painting, though it is of severer aspect.

While I was seated in the Pitti Gallery engraving from "The Concert," by Giorgione, two young ladies came by, and each began her respective explanation of the picture. Said the first: "Oh, what a glow of inspiration is in the player's face! He has struck a heavenly chord, which so moves his friend from behind that he drops his violin, and tenderly approaches, exclaiming, 'O brother, brother! how grand! how glorious!'"

"Now," said her friend, "I should think that his violin got out of tune, or that a string broke, and he approaches him reluctantly, and lays his hand on his shoulder so very gently, for he is sorry to disturb him, so thoroughly wrapt in the music is he."

This was quite ignored by the former, who continued in the same ecstatic strain as before. Then the father came up, and, his opinion being asked, he said: "You see, the guide-book says that these are the portraits of Luther, Calvin, and Melanchthon. Now you know Luther struck the first chord—in the Reformation; Calvin joined in the concert; and Melanchthon, he—he—stood by listening. But if you will listen to me—this is only another version of the 'Three Ages of Man.' There you see the young man with the plume in his hat, in all the pride of expectant youth; the middle-aged man playing is already in the thick of the

concert of life; and the old man behind finds his violin out of tune—he is not exactly in accordance with the order of the age."

They go away, and another party take their place.

"Do you see," says a lady to her companion, "that old priest there with the violin? Does n't he look the picture of the old monk we saw in the lager-beer saloon! Well, I declare, I would n't cart that painting home with me; no, not if it was given me! Ugh! what an ugly thing! Come away."

"The Concert," an engraving of which faces this page, hangs in the Hall of the Iliad of the Pitti Gallery, and measures three feet seven inches in height by four feet one inch in width. This was one of the works of art cut out of its original frame and taken to Paris in the days of Napoleon. Old engravings of it show a different setting on the canvas, giving more space to the bottom and sides, and less to the top. The instrument in the monk's hand appears to be a lute. The garment of the one at the harpsichord, instead of being quiet and simple, as at present, is cut up with a variety of folds, surmounted by a cape. No doubt the details of this garment would be visible if the picture was cleaned of its thick mantle of varnish. In my engraving I have cut off a portion of the unnecessary background at the top, and am thus enabled to give the heads larger, and make a full-page block of it. Its original line of definition appears to have cut off a portion of the plume. When the picture was restored to Italy, the rest of the plume and the high background were added; but this high background is not in accordance with Giorgione's style, nor in the manner of his time.

In coloring it is warm and effective. How magnificent it is in composition! The head of the player is remarkable for expression; the open eye and the dilated nostril show a soul surcharged with the music. He turns abstractedly in response to the soft touch on his shoulder. The hands, too, are fine in their grip of the keys. They are not light notes, but solid, full chords.

T. Cole.

THE BLUEBIRD.

In the very spring,
Nay, in the bluster of March, or haply before,
The bluebird comes, and, a-wing
Or alight, seems evermore
For song that is sweet and soft.

His footprints oft
Make fretwork along the snow
When the weather is bleak ablow,
When his hardihood by cold is pinched full sore.

Then deep in the fall,
In the Indian-summer while, in the dreamy days,
When the errant songsters all
Grow slack in songful ways,
You may hear his warble still
By field or hill;
Until, with an azure rush
Of motion, music—hush!

He is off, he is mutely whelmed in the southern haze!

Richard Burton.

DRAWN BY IRVING R. WILES.

IGNACE JAN PADEREWSKI.

PADEREWSKI: A CRITICAL STUDY.

PADEREWSKI is unquestionably an inspired and a phenomenal pianist. He possesses the power of interesting and arousing the enthusiasm of an audience of the highest musical culture, as at Berlin, and of

giving pleasure and delight to one of less musical intelligence and simpler tastes, as in some English provincial town. This is a fact of great significance, for it shows the rare combination of the various qualities which in the aggregate make up a great and unique artist whose ardent and poetic temperament is admirably proportioned and well balanced.

Within the last few years we have been favored with the presence of many pianists of the first rank, such as Joseffy, Pachman, Rosenthal, D'Albert, Friedheim, Grünfeld, Rummel, Scharwenka, and others, and among our own resident players Fanny Bloomfield-Zeissler, Adèle aus der Ohe, Rivé-King, and many others who compare favorably with the best from foreign lands. While fully recognizing the high artistic merit of all these, and acknowledging the great pleasure their performances have given, it may be said without invidious distinction that an artist of such a distinctly pronounced individuality as Paderewski is an exceedingly rare occurrence—indeed phenomenal. The mechanical part of piano-playing has of late years been so systematized, and the methods of acquiring a high degree of skill have been so improved, that the possession of mere technical facility is a foregone conclusion, and has in a great degree lost its interest unless combined with a discriminative and poetical conception and a true musical interpretation. Of two pianists possessing an equal technical equipment the one whose personality is the most intense, and at the same time lovable, will be sure to delight and interest. Music is in its nature emotional, and hence requires intense expression of feeling in its genuine interpretation; but this must be kept within due bounds by the exercise of an intelligent and intellectual conception and a discriminative touch, thus combining in proper degree both the qualities of heart and head. The most successful results will surely follow when a nice balance between the two is established and maintained in due proportion, while an undue preponderance of either will lead to disastrous results, even if the performer be possessed of genius.

The playing of Paderewski shows a beautiful and happy blending of these essential qualities. He mirrors his Slavonic nature in his interpretations, with its fine and exquisite appreciation of all gradations of tonal effects. His marvelous musical touch, a great, mellow, and tender voice, chameleon-like, takes on the color of the dominant mood. He is a thoroughly earnest and at the same time an affectionate player, and too much stress cannot be laid on the humanism of his style, which is intensely sympathetic, and so eclectic that it embraces all schools. His never-failing warmth of touch and his vivid appreciation of tone gradations and values result in wonderfully beautiful effects. In addition to these qualities, his magnetic individuality puts him at once in sympathy with his hearers, and this magnetism is felt and acknowledged even by those who do not entirely and uniformly approve of all of his readings and interpretations of the great composers.

Since Bach's time, and no doubt long before it, two distinct schools have wrangled over the question of subjectivity and objectivity in the interpretation of great works of art. The discussion as to the musical significance of the various works of Richard Wagner has already begun, notwithstanding the fact of his comparatively recent death, and, this being the case, we can easily understand the difference of opinion as to how Bach and Beethoven should be played. I remember hearing Moscheles play Beethoven's sonatas, as also the preludes and fugues of Bach, especially those from "Das Wohltemperierte Klavier," and his performance of the latter was especially beautiful and satisfying. Discarding all pedantic, austere, and stiff methods, his treatment was simple, graceful, and flowing in design, each voice being distinctly heard, but in due proportion, and not in too assertive a way. The angular fashion of playing Bach must have had its rise from the old German school of organ-playing, in which no variation of registration was permitted; but a fugue was played, as it is now, with full chorus stops from beginning to end. However this may be, Moscheles preferred a feeling and warmly colored interpretation of Bach's works on the pianoforte, and so expressed himself to me in private conversation; and he was much closer to the Bach tradition, as set forth in Forkel's biography, than we are to-day. He could look backward to within a generation of the great Leipsic cantor, and he had listened to Beethoven's playing.

Rubinstein is even more fond, tender, and caressing in his playing of Bach, bringing out all imaginable beautiful shades of tone-color in his rendering of those works. And why should this be otherwise, since Bach's compositions are so full of exquisite melody? Surely such emotional strains should receive a loving and musical rendering. As Moscheles played Bach a half-century ago, and as Rubinstein played him later on, so does Paderewski play him now—with an added grace and color which put these great contrapuntal creations in the most charming frames. It is great, deep musical playing combined with calm, quiet repose and great breadth of style. Paderewski has an advantage over Rubinstein, however, in the fact that he is always master of his resources and possesses power of complete self-control. This remarkably symmetrical balance is entirely temperamental, and may be discerned in the well-shaped contour of Paderewski's head, his steady gaze, and his supreme command of the economies of movement. In Rubinstein there is an excess of the emotional, and while at times he reaches the highest possible standard, his impulsive nature and lack of self-restraint are continually in his way, frequently causing him to rush ahead with such impetuosity as to anticipate his climax, and, having no reserve force to call into action, disaster is sure to follow. He does not economize his strength to good advantage, but uses up his power too soon. Comparisons are not always profitable, but may be permitted in mild form on account of the instruction they convey. Thus, of five prominent pianists, in Liszt we find the intellectual-emotional temperament, while Rubinstein has the emotional in such excess that he is rarely able to bridle his impetuosity. Paderewski may be classified as emotional-intellectual,—a very rare and happy blending of the two temperaments,—and Tausig was very much upon the same plane, while Von Bülow has but little of the emotional, and overbalances decidedly on the intellectual side. There must always be two general classes of pianists—those whose interpretation changes with every mood, while the playing always remains poetic, fervent, artistic, and inspired, because it is impossible for them to do violence to the musical nature which they have received by the grace of God, and others whose playing lacks warmth and *abandon*, notwithstanding the fact that it is careful, conscientious, artistic, and in the highest degree finished. The performances of the latter are invariably uniform, and are exact to such a degree that one can anticipate with great accuracy each accent, emphasis, *nuance*, and turning of phrase from beginning to end. Of these classes Rubinstein and Bülow present good illustrations in contrast.

This leads to the consideration of Paderewski's playing of Beethoven, and on this subject I beg leave to repeat, with slight variation, what I said in a recent article in "The Musical Courier." Whenever a pianist makes his first appearance in public as a Beethoven player, he is at once subjected to strictures on all sides by numerous critics who seem to have been lying in wait for this particular occasion, and there immediately arise two parties, each holding positive opinions, of which the one in the negative is usually the more numerous. This is by no means a new fad, but quite an old fashion, dating back, at least as far as the writer's experience goes, something over forty years, and probably much further. Is the ideal player of Beethoven a myth, or does he really exist? If so, who is he, and where is he to be found? In short, are we not looking for something that is much in the imagination? Or, perhaps (be it said with due reverence), are not the compositions themselves responsible in part for this mystified state of things? Forty years ago my teachers, Moscheles, afterward Dreyschock, and finally Liszt, used to say that Beethoven's piano compositions were not "klaviermässig." This word has no precise English equivalent, but might be translated "pianofortable." In other words, they are not written in conformity with the nature of the instrument. Musicians generally have agreed all along on this point. Beethoven's musical thoughts were symphonic, so to speak, and require the orchestra for adequate expression. Many of his piano passages lie most awkwardly under the fingers, and certainly would never have been written by a skilled virtuoso who was simply a pianist *per se*.

Moscheles has always been an acknowledged authority as to Beethoven, and he once told me during a lesson that he considered Liszt an ideal, or perhaps his word was a "great," Beethoven player. As is generally known, Liszt had a prevailing tendency in his piano-playing to seek after orchestral effects, and thus found himself all the more at home in these compositions. But when has the world ever found another player of Liszt's magnificent caliber who could so intelligently and ably adapt himself as an interpreter of all kinds of music, who was always and ever master of his resources, and who never fell into the error of anticipating his climax? Or, if perchance he found himself in the least danger of such an event, he would readily arrange and develop a new climax, so that at the conclusion of his performance he was always sure to have worked his audience up to a state of almost crazy excitement and unbounded enthusiasm. He was at this time—1853—forty-two years old and at his best estate. But even Liszt, who possessed in such an unexampled degree all of the

faculties which in the aggregate make up the equipment of a perfect and even phenomenal player, had his limitations in certain directions and details, and, notwithstanding the opinion of Moscheles, many of the critics of the day maintained that he was no Beethoven player, and that his interpretation, instead of being severe, dignified, and austere, was too sensational. His touch was not so musically emotional as it might have been, and other pianists, notably Henselt, Chopin, Tausig, Rubinstein, and now Paderewski and some others, excel him in the art of producing beautiful and varied tone-colors together with sympathetic and singing quality of tone. It seems to me that in this matter of touch Paderewski is as near perfection as any pianist I have ever heard, while in other respects he stands more nearly on a plane with Liszt than any other virtuoso since Tausig. His conception of Beethoven combines the emotional with the intellectual in admirable poise and proportion. Thus he plays with a big, warm heart as well as with a clear, calm, and discriminative head; hence a thoroughly satisfactory result. Those who prefer a cold, arbitrary, and rigidly rhythmical and ex-cathedra style will not be pleased.

Without going closely into detail, there are certain matters concerning Paderewski's mechanical work which deserve the attention of students and others interested in piano technic. In many passages, without altering a note from the original, he ingeniously manages to bring out the full rhythmic and metrical effect, also the emphasis necessary to discriminative phrasing, by means of a change of fingering, effected either by interlocking the hands or by dividing different portions of the runs and arpeggios between them. In this way the accents and emphasis come out distinctly and precisely where they belong, and all of the composite tones are clean-cut, while at the same time a perfect legato is preserved. His pedal effects are invariably managed with consummate skill and in a thoroughly musical way, which results in exquisite tonal effects in all grades and varieties of light and shade. In musical conception he is so objective a player as to be faithful, true, and loving to his author, but withal he has a spice of the subjective which imparts to his performance just the right amount of his own individuality. This lifts his work out of an arbitrary rut, so to speak, and distinguishes his playing from that of other artists.

The glissando octave passages near the end of the C major Sonata, op. 53, he performs as originally designed by Beethoven and with the desired effect, notwithstanding Dr. Hans von Bülow's assertion that this method of execution is impossible on our modern pianos, on account of their heavy and stiff action. Paderewski,

however, has the secret of a thoroughly supple and flexible touch, resulting from a perfectly elastic condition of shoulder, elbow, arm, and wrist, together with the power of keeping certain muscles, either singly or collectively as may be desired, in a state of partial contraction, while all of the others are "devitalized" to a degree which would delight the heart of a disciple of Delsarte.

The heartfelt sincerity of the man is noticeable in all that he does, and his intensity of utterance easily accounts for the strong hold he has over his audiences. He does not give us a remote and austere interpretation of Beethoven, but one which is broad and calm, manly and dignified, while it palpitates with life and is full of love combined with reverence. On this account it sometimes fails to please those who would strip music of its outward vestments,—its flesh, so to speak,—and skeletonize it. Paderewski's playing presents the beautiful contour of a living, vital organism.

Naturally, being a modern pianist, he is in close sympathy with the works of the Romantic school, his poetic personality finding its supreme utterance in the compositions of Schumann and Chopin. He plays Schumann with all the noble, vivid fantasy which that master requires, though perhaps lacking a little sometimes in his reckless humor. In Chopin's music, the finest efflorescence of the Romantic school, Paderewski's original touch is full of melancholy pathos, without sentimental mawkishness, and without finical cynicism. He has his robust moods, and his heroic delivery of the A flat Polonaise, taken in the true and stately polonaise tempo, is tremendously impressive. It possesses that subtle quality expressed in some measure by the German word *Sehnsucht*, and in English as "intensity of aspiration." This quality Chopin had, and Liszt frequently spoke of it. It is the undefinably poetic haze with which Paderewski invests and surrounds all that he plays which renders him so unique and impressive among modern pianists.

Paderewski has one quality which Chopin always lacked in degree—namely, the power of contrast; and, as pertinent to this, I remember that Dreyschock told me that many years ago he, in company with Thalberg, attended one of Chopin's concerts given in Paris. After listening to the delicately exquisite touch of the great Polish artist and to his gossamer arpeggios and dainty tone-embroideries, Thalberg, on reaching the street, began to shout at the top of his lungs. Dreyschock naturally asked the reason for this, and Thalberg's reply was, "I have been listening to a *piano* all the evening, and now must have a *forte*."

Little fear of a forte being found lacking in Paderewski's playing, which is at times

orchestral in its sonority, the most violent extremes of color being present when required. Listen to him in the Rubinstein Étude or the Liszt Rhapsodies, with their clanging rhythms and mad fury, and ask what pianist since Liszt has given us such gorgeous, glowing colors—

such explosions of tone, and the unbridled freedom of the Magyar.

Paderewski is an artist by the grace of God, a phenomenal and inspired player, and, like all persons of large natural gifts, a simple, gracious, and loving character.

*William Mason.*¹

PADEREWSKI: A BIOGRAPHICAL SKETCH.

IGNACE JAN PADEREWSKI is the son of an old Polish country family whose home is in Podolia, a province of Russian Poland, where he was born in 1860. Although his father was able to provide in some degree for the education of his children, young Ignace soon found it necessary to support himself. But—better than money—aristocratic instincts, high breeding, high spirit, indomitable will, the love and power of work, those blessed heritages of good blood, were his by birth and training.

The lad owed his musical organization to his mother; his father, who was a gentleman farmer, had no musical tastes.

One class of mankind is born to receive its strongest impressions through the eye, another from words and thoughts, a third from bodily sensations, and a fourth through the ear. If we could follow each class into its mental life, we should find that a large part of its memory, thinking and doing, was dependent on its ruling sense. Paderewski's world is preëminently a world of tone. Every sound he hears makes a clear, abiding mental impression. But he is great because he is symmetrical enough to live also in a world of sights, ideas, and actions.

Our artist passed the early years of childhood in the country. He was motherless, but "Him by the hand kind Nature took." She showed him her gracious silences, her sounds of forest, field, and brook, her stir of living growth, her various skies and motions. To this first, best music lesson his imagination owes much of its objective material.

From earliest infancy he could "hear." At three he stole to the piano to touch the keys and to listen. At six he began to study. The teacher was a fiddler who helped out his living by giving lessons on the piano, which he could not play. It did not even occur to him to bestow upon his pupils that peculiar treasure of his own instrument, the power of recognizing tones. But it was not necessary. Young Ignace knew the pitch of every sound he heard. He could identify not only the notes in every chord, but each separate set of vibrations that goes to

make up that variable compound we call tone. "I *must* hear them, because I try to color my tone," said he, when the writer put the question; and added, "I do that largely with the pedal."

The creative instinct was alive in him as soon as he could think at all. He did not long to stir his fancy by singing and playing the literature of music, but to make the music himself—to express his ideas and emotions through his own musical forms. After a year or two another teacher was engaged, an old man who came down into the country once a month. He had as little notion of technic as his predecessor. He thought it sufficient to bring with him a collection of four- and six-handed pieces,—pot-pourris from popular operas,—which the little boy and his sister played at sight. There his instruction ended. The children were left to find their own way among the keys, and to stumble as they went. But though genius may stumble, it does not stick in the bog. "Art," says Emerson, "is the path of a creator to his work," and certainly genius is the faculty of making a short cut thither. Within, it possesses the image of the object to be arrived at clear and bright; and it has the woodsman's instinct by which it threads the jungle of ways and means. The young student always knew what he wanted to do; he played, listened, compared, and thought till he found the right way. Paderewski's marvelous tone-quality is an example. Its perfection has been the work of his life, but it has been wholly his own discovery, guided by an exquisitely sensitive ear. When a boy of twelve, Paderewski went to the conservatory at Warsaw. There he studied harmony and counterpoint with Roguski, and took piano lessons (he never studied any other instrument) of Janotha, the father of Natalie. Janotha was then eighty years old. His notions of technic must have been those of his own generation. But how mellow the culture bestowed by contact with this old musician's lifetime of musical experience and tradition, and with his objects of veneration! Paderewski moves among the old forms of music with the freedom of early good musical breeding. The creations of the past are flex-

ible in his hands, because since childhood he has known them to be living, not dead. The boy's physical equipment was happy. That supple, elastic frame, offspring of generations of Polish gentlemen trained to fence, dance, and ride, needed a minimum of discipline for the dexterities of the piano. Nerve, eye, and hand were ready. In his after years no more tireless student of technic ever lived; but as a boy our artist had small appetite for virtuosity. Still, those years of independent music, untrammelled by teachers' traditions or drill, were rich years. The original methods of fingering, habitual to the artist we know, were felt out and found out to a great degree as he played and extemporized.

Warsaw, a city of over half a million inhabitants, is the literary and musical center of Poland. Hugo says that a suffering and oppressed nation always sings. Certainly the musical instinct of Poland is keenly alive. In this atmosphere was much to animate and to mature the young student. The conservatory afforded good instruction in counterpoint and composition. In its excellent musical library the future composer speedily made acquaintance with the masterpieces of his art. To the conservatory of Warsaw he traces the beginning of what may be called the literary side of his musical culture, as well as his love of general education.

At sixteen young Paderewski made a tour through Russia. During this journey he played his own compositions and those of other people; but, as he naively confessed, they were all his own, no matter what he played, for he did not know the music, and as he had little technic and could not manage the hard places, he improvised to fill up the gaps. There was one concerto by Henselt of which he could play the first and second themes, but neither the extensions nor the passages. But he played it before audiences, and got people to listen to it. It must have been a pretty sight. The boy, with his bright hair and delicate, mobile face, sensitive and shy, but trustful in his power to win and charm, gathered about him the audience, often poor and rough, submitting unawares to the old spell of genius,—the genius of the singer,—the very same type of musician that the Greeks understood so well, and gathered up in all its lovely detail into the myth of Orpheus. The journey was of great value. The young artist learned to watch his audiences and to play to them, just as he does to-day. He tested his powers, and his bright boy's eyes noticed every detail of costume, adventure, national holiday or dance. He stored away among his artistic material the characteristic intonations of every dialect and the melody of every folk-song he met.

The tour over, Paderewski went back to

Warsaw. To please his father, he studied, and six months later obtained his diploma from the conservatory. He was eighteen when he became professor of music in the same institution. The noble thirst for knowledge was upon him, and the money he earned was spent on literary studies, which he prosecuted with different masters, principally at night, after the day's teaching was over.

Paderewski has all his life sought people of character and culture for his companions. A few choice intimates, and no admittance to commonplace folk, has been his rule. The man whose influence upon his character was greatest, and whose friendship was most devoted, was the late Professor Chalubinski, Poland's best physician, and one of her greatest men in character and intelligence. As long as he lived Chalubinski felt the keenest interest in the fortunes of his earnest young compatriot. The love the two men felt for each other stood that sharpest of tests—gratitude.

Married at nineteen, a widower at twenty, with hope crushed out of him, Paderewski threw his whole life passionately into music. He went to Kiel in Berlin, and studied composition. Kiel was a wonderful teacher of counterpoint. "You will soon 'hear' very differently," he used to say to his new pupils, as he taught them to braid the strands of polyphony. The one composer who carried into modern life the musical feeling of the preceding century, his own style was simple, unaffected, and noble. No pupil ever left him without new insight into fugue and sensitive feeling for the peculiar beauties of the earlier school. Paderewski declares Bach the "poet of musicians." But it was inevitable that he, whose ardent spirit belongs to our own age, should reject for his own composition the tradition of a past epoch. Paderewski's pure, transparent, and well-balanced fugue playing is probably the best result of Kiel's influence. Kiel died about this time, and a year later, in 1884, our artist was still in Berlin, but under the tuition of Heinrich Urban. As a master of composition this great musician seems to have satisfied every requirement.

At twenty-three Paderewski was professor of music in the conservatory of Strasburg. He was still poor, but poverty could not grind down his spirit, nor narrow his conception of life. It was simply a stimulus to incessant work. He was then accustomed to visit a certain little mountain summer resort frequented by other distinguished artists, among them Mme. Modjeska, and her husband, Count Bozenta Chlapowski. Mme. Modjeska describes him as at this time a polished and genial companion; a man of wide culture; of witty, sometimes biting, tongue; brilliant in table-talk; a man wide

awake to all matters of popular interest, who knew and understood the world, but whose intimacy she and her husband especially prized for the "elevation of his character and the refinement of his mind."

His familiarity with musical literature was already exhaustive. To amuse these same friends he once extemporized exquisitely upon a theme in the characteristic style of every great composer from Palestrina to Chopin. When he had finished they begged him to play it once more according to himself, and that time it was the most beautiful of all. That night they sat down by the piano soon after dinner, and it was five in the morning before he rose. Then, alarmed at his white, haggard face, they dragged him from the stool. Since his juvenile tour his tone and execution had been unconsciously growing, and his technic developing with use. It was already great. But his playing, though interesting as the expression of the composer's ideas, lacked finish, or even security. When one passage was too knotty he still improvised another in its place, easier but more graceful.

Paderewski is a most patient student, heedful of that still small voice as seldom heard in art as in ethics, and he is sensitive to music's truest and most dignified claims. Never has he struck a note to make a popular effect, or descended to a claptrap ornament to excite a vulgar audience. He *plays to his hearers* more than any other artist of his day, but it is with the delicate and sensitive instinct of the great orator who *speaks to his hearers*, not above or beyond them. Vanity, personal or artistic, he has none. He is at once intensely proud, and most humble in his estimate of himself. He is known, everywhere, to remember not only a melody, but a kindness, forever.

Resolving to become a virtuoso, he sought Leschetitzky in 1886, and set to work with his accustomed energy. Find a way, or make one, had always been his motto, and it is characteristic of artists of his type of genius that they more often find than make the way. While determination is surveying, hewing, and building a causeway, they have long since spied a practicable pass and slipped nimbly through to the goal. Hence the repose, harmony, and beauty of their work; a serenity that is the sign of normal development, a revelation of fulfilled natural law.

Such has been Paderewski's whole musical growth. His art is the vivid, instinctive expression of his maturing inner life, which he has constantly turned into music. It has known no sudden transfigurations and spasmodic activities. It has had its roots in his feeling and doing, far from public adulation and concert-room stimulus. To Leschetitzky Paderewski ascribes

"his finish, security, and virtuosity." He was with him only seven months, making his début in Vienna in 1887. But virtuosity is a matter of manual exercise; he achieved it, but the amount of physical fatigue and endurance involved can hardly be estimated.

We can trace the hand of the great Polish teacher of artists here and there in the playing of his greatest pupil. The limpid run, the delicate staccato, the superb octave, we have seen before in Essipoff. But the tremendous originality of the man stands out in each and every detail of his music, and, like his tone, his technic must be considered as his own, since both depend essentially upon the generative impulse of his artistic conception, and the habitual correction and leading of his ear.

At seven Paderewski wrote his first music, a set of Polish dances. In 1882 he found a publisher in Berlin. His Menuet, Chant du Voyageur, Melodie, Legende, Variations, and Polish Dances, but especially his Concerto, are much valued throughout Europe. The majority of his compositions were already written when, at the age of twenty-five, he went to Vienna.

No one who has heard the mature artist of to-day can doubt where he has won his pathos and his strength. No musician can make counterfeit experience pass current. He may not be able to express all he feels, but he cannot give voice to what he has never felt. An early manhood of sturdy self-respect and industry, a nature sweet, loving, and clean, a heart that has learned many a lesson of suffering, are apparent in every note and phrase.

Lively patriotism, filial responsibility, a married life that ran from joy to despair in less than a year, a fatherhood constantly attuned to sympathy and tenderness for his motherless and invalid boy, have done their gracious work in his music, and taught him the secret cry of human hearts.

With Paderewski practice and study never cease. Before every concert he is accustomed to shut himself up and to practise all night, going carefully over his whole program. No point of phrasing, technic, or execution escapes him. When all is securely thought and worked out, the artist is ready for his hearers. The next day he goes to the piano master of his material, and, free from concern about notes or mechanical means, plays with perfect abandon out of his inner feeling. This, his own statement, is borne out by his vividly expressive face when playing.

The spirit that speaks through Paderewski's music is a spirit of light. We see the reason when we recognize that the great virtuoso of our generation has courage and rectitude not only to work but to live for his high calling.

Fanny Morris Smith.

"HOW PADEREWSKI PLAYS."

I

If words were perfume, color, wild desire;
If poet's song were fire,
That burned to blood in purple-pulsing veins;
If with a bird-like thrill the moments throbbed to hours;
If summer's rains

Turned drop by drop to shy, sweet, maiden flowers;
If God made flowers with light and music in them,
And saddened hearts could win them;
If loosened petals touched the ground
With a caressing sound;

If love's eyes uttered word
No listening lover e'er before had heard;
If silent thoughts spake with a bugle's voice;
If flame passed into song and cried, "Rejoice! Rejoice!"

If words could picture life's, hope's, heaven's eclipse
When the last kiss has fallen on dying eyes and lips;
If all of mortal woe

Struck on one heart with breathless blow on blow;

If melody were tears, and tears were starry gleams
That shone in evening's amethystine dreams;

Ah, yes, if notes were stars, each star a different hue,
Trembling to earth in dew;

Or if the boreal pulsings, rose and white,

Made a majestic music in the night;

If all the orbs lost in the light of day

In the deep, silent blue began their harps to play;

And when in frightening skies the lightnings flashed

And storm-clouds crashed,

If every stroke of light and sound were but excess of beauty;

— If human syllables could e'er refashion

That fierce electric passion;

If other art could match (as were the poet's duty)

The grieving, and the rapture, and the thunder

Of that keen hour of wonder,—

That light as if of heaven, that blackness as of hell,—

How Paderewski plays then might I dare to tell.

II

How Paderewski plays! And was it he
Or some disembodied spirit that had rushed
From silence into singing; that had crushed
Into one startled hour a life's felicity,
And highest bliss of knowledge—that all life, grief, wrong
Turns at the last to beauty and to song!

DECEMBER 18, 1891.

R. W. Gilder.

GAY'S ROMANCE.

BY THE AUTHOR OF "THE ANGLOMANIACS," ETC.

I.

WHEN Gay Berkeley, a bright-eyed girl in quaint, made-over frocks, took her walks abroad with Gréat-Aunt Penelope, who was arrayed in a large bonnet with tulle ear-tabs and a shawl of China crape trailing limply over a black silk gown, she used to think there could be no spot on earth in which so many interesting things had happened, and so many interesting people had lived, as old Belhaven. Every house, street, paving-stone, evoked from the maiden aunt's unfailing repertoire a reminiscence. When Miss Pen met on the sidewalk some other large-bonneted lady, they talked together of mysterious has-beens; and before they parted, the lady would generally take the girl's chin in hand to look her in the face, and tell Gay that she was the image of her great-grandmother, or that she had her Uncle Marmaduke's own nose.

Gay, who in those days looked at most things from a Castle of Otranto standpoint, liked the externals of her birthplace, where, early left an orphan, she had always dwelt under the care of her father's aunts. She could appreciate the picturesque value of its grass-grown thoroughfares, bordered with blocks of houses, mostly of red brick faced with white, many of them detached and set comfortably back in brick-walled gardens harboring the sun; its venerable churches, inns, lodges, market-places, remaining there to tell of the great founders of the town; its wide area of surrounding landscape, to which, from a hill beyond the city limits, visiting strangers were proudly introduced. From Shooter's Hill, looking across the caterpillar structure of the Long Bridge, one saw the white gleam of the Capitol dominating the roofs and spires of Washington; the colonnades of Arlington House; the beautiful, broad Potomac as far as Gunston, Mount Vernon, and Belvoir; the lovely valley of Cameron—all these enframed in undulating woods. Whenever Gay heard travelers dilate upon the Rhine, the Tweed, and the Thames, she was conscious of a bridling desire to bid them view the Potomac from the top of Shooter's Hill, and die.

But this much any one could and still can

see. More important in coloring her ideas was the daily intercourse with a community of people who belonged to the semi-feudal and essentially aristocratic side of early American society, even then gliding away like the sands of an hour-glass. Everybody they knew had somewhere touched history; everybody kept traditions rubbed up with chamois leather and set sidewise on shelves. Life flowed so tranquilly. The visits, tea-drinkings, church-goings, benevolent societies, never developed anything newer than the recurrent tragedies of birth and death. Young men who grew up there stretched their limbs, inflated their chests, looked away over at the far horizon, and left the town. Everything in the way of stir or bustle was executed with such genteel deliberation that, like the immortal Joe in *Pickwick*, it fell asleep *in itinere*.

But to a speculative young person like Miss Gay there was entertainment to be found, and she well knew where to look for it. When not poring over the old books in the Princess Royal street house where she was born, Gay studied human nature in the homes of her aunts' friends. By Miss Penelope, who was a mine of genealogical information, she was continually fed with stories; and when in search of the concrete forms of excitement, what better than to perch on the edge of the kitchen table where black Peggy was rolling out her dough, and to elicit the marvels that the old cook, "when i' the vein," would pour out in accents as rich and soft as oil?

The drawback to Peggy's narratives was her anxiety to assert herself as an eye-witness of all events. In the matter of Washingtoniana, especially, the old woman, accustomed to be questioned by strangers as to the minutest recollections cherished by the town of her most illustrious citizen, was very tenacious of associating herself in every scene described.

"Think of it, Aunt Peggy," Gay said once, when on a visit to the kitchen, "Auntie has been telling me that her grandfather had just finished building this house when George Washington was recruiting his ragged volunteers to march against the French on the Ohio. She says her grandpapa told her the young lieutenant-colonel was a long-legged, gawky fellow, with big hands, and so solemn the Belhaven girls would run away from him whenever he came near. But they sang a different tune when he came back from the wars."

"Wot you tellin' me, chile?" quoth Peggy, contemptuously. "T'ink I ain't heard Miss Lucindy beg Miss Sally many a time to go down in de parlor an' 'ceive Kunnel Wash'n'ton, 'stid o' her? An' Miss Sally say as how she would n' do no sich a t'ing 'less Miss Lucindy promise to let her wear dat blue padu'soy o' hers next Sunday to Christ Church. An' all de while dem gals was a-'sputin', dat poor young feller was a-coolin' his heels in de werry place wher ole Miss got her big arm-cheer dis day."

"Why, Aunt Peggy," exclaimed Gay, "that was in 1754!"

"Who said it wor n't?" queried the old woman, testily.

"It would make you—oh! at least a hundred and twelve years old—"

"How 's I gwine to git my dinnah, like to know?" interrupted Peggy. "Reckon Miss Pen 'll come out cheer an' riz Richa'd Henry roun' my years nex' t'ing. You Cynthy! Hurry an' put dat crock on ice, ef you 'spec' to git de bonnyclabber sot for tea! Mars! Awe, Mars! Nem o' Gord, niggah, t'ink fire burn 'dout wood? Hain't heerd yo' ax strike a lick sence you chop my chickens' hades off. You Trip! String dem snaps 'fo' I bu's' yo' cocoonut."

In the sudden whirlwind Gay and her questions vanished from the scene.

No story of the past hidden behind Belhaven house-fronts had quite such power to charm Gay's imagination as that of two stricken sisters who lived at a place called the Poplars, just outside the town, their sole companion a slave-woman, as gray and as misshapen as a gnome. Once a week, for years past, it had been Miss Penelope's custom to walk out to the Poplars, attended by Dennis, her man-servant, carrying a basket of home-made delicacies; oftentimes had Gay begged to be allowed to go with them, and to wait outside the door till her aunt's visit was at an end. Miss Penelope's foot alone was permitted to penetrate the dim hall with the stately fan-light over the front door, where she was received by her friend of childhood, Miss Selina Stith, the younger of the owners of the house. Dennis, relieved of his burden upon the steps, was glad to sneak away to the common opposite, where such cheerful everyday sights as geese stalking in a string, cows grazing, and boys wading in little pools, might restore his equanimity. Gay, less timorous, liked to stroll along the weedy carriageway, with its iron posts and chains, shut off from the street by a high brick wall, and to gaze up at the rows of windows like dead eyes, at the chimneys whence arose so little smoke, at the dreary ivy that had overlapped and strangled every outlet of the melancholy house. When Aunt Penelope came out, it was always with reddened

eyelids, and a cloud upon her usually smiling face.

"No better, Aunt Pen?" Gay would ask.

"No better, my dear child, and never will be this side the grave, poor thing," the good lady would reply.

It had been full twenty years since any one had seen the elder of the Misses Stith. More familiar to neighborhood eyes was Miss Selina, who sometimes, in the dusk of warm evenings, came out of the decaying mansion to wander wraith-like in the streets. The children of the mechanics who lived on the outskirts of the town were accustomed to the apparition, and, when she passed them at their play, gazed curiously after but did not follow the queer little figure in the garb of fifty years before—an "umbrella" frock with leg-o'-mutton sleeves, and a poke-bonnet draped with a veil of sprigged black lace.

Now and then she would pause beside some group at play, and two eyebeams of softest blue would shoot athwart the meshes of her veil and rest quietly on the little ones. Sometimes she produced from her reticule odd toys of an unfamiliar pattern, and silently laid them in the lap of some baby in a pet or neglected by its mates. But she never spoke, and as darkness closed would melt into the shadows of the night.

"I wish I could see Miss Selina face to face," sighed Gay, one morning, when returning with Aunt Penelope from the customary pilgrimage. "Major Garnett told me she was the prettiest girl that ever grew up in Belhaven. He says when he was a lad, and used to look up into the organ-loft of Christ Church and see her singing, all in white, he called her St. Cecilia."

"Yes, my dear; a beauty she was, and so gay and merry—her paintings on rice-paper universally admired—and such a finger for the harp! It is one of the mysteries of an inscrutable Providence why she should have followed Celestia and become—ahem—deranged."

"And, O Auntie, Peggy says the curse upon the Stiths may one day be removed by a secret you know of, but that I am not to be told. And I think, considering I'm well past fifteen—do be a dear, and tell me what it is."

"Peggy should certainly be checked," began Aunt Pen, with a rather guilty blush, remembering a nocturnal gossip of her own with the old woman not many days before.

"If I could only go inside the Poplars *once*," pursued Gay, plaintively. "Think of aching all one's life to get behind a door."

"Don't think of it, child. It is too sad for words. There is nothing for you to see," replied Miss Pen, with so woebegone a face that Gay dared not persist.

Everybody knew the old story of the Stiths.

Just before the American revolt against the crown, there had arrived to settle in Belhaven the younger son of an English family, a man handsome, winning, and possessed of sufficient fortune to make people speculate as to why he came. Oxford-bred, and carrying good credentials, he, however, speedily made for himself a place in the affections of the town, and married a beautiful heiress who was the toast of the country-side. Of the cause impelling Mr. Theophilus Stith's emigration to the New World, tradition said that it was a last effort to break the spell of a curse transmitted through several generations of his ancestors to the younger son of his family. Long ago, the English legend ran, there had been of this line a daring youngster, who in a fit of bravado pulled down a ruined chapel upon his estate and built with its stones a banquet-hall, in which, wine-cup in hand, he had been struck dead while reveling. Since then prosperity had forsaken every younger son born to the house of Stith. Belhaven doubters, and there were not a few to greet this myth with mocking, had in time to witness the dark close of a career begun among them under brightest auspices. Let Miss Penelope take up the tale as Gay heard it in her youth.

"Yes, my love; Mrs. Theophilus was the envy of the place. Her husband built and fitted up for her the Poplars, then well out of town; all the furniture came from England, together with a handsome new chariot, to which she drove 'four' along the Rolling Road and elsewhere. For a little while she was as happy as a queen. Then children came very fast, and every corner of the house was full of young faces and voices — ten children had Mrs. Stith. Selina, my contemporary, was the youngest of the flock."

"Well, Auntie?"

"Oh, they had trouble; his habits were not good, I've heard. One day his horse came home to the Poplars without its master; they picked up Mr. Stith stone-dead, and his wife's death followed shortly."

"And then, Auntie?"

"My dear Gay, you know it is one long tragedy. Every member but two of that gifted and promising household came to a sudden or tragic end."

"It is like one of the cycles of Greek plays, where whole families are swept away by death, that Dr. Falconer read me about in our lesson yesterday," said Gay.

"On poor Celestia, who with her sister alone survived, fell the burden; for she had been the little mother of the rest. She and Selina had their youngest brother Richard's only son to bring up, a handsome, wilful boy, called Llewellyn. Celestia was always a reserved, self-

centered nature, but in her way she loved Llewellyn dearly, while Selina lavished on him her full, warm heart. The lad had entered the university, and was doing well, when a dispute arose between him and his older aunt about some matter trifling enough, God knows, to have caused such dreadful results. Celestia was not happy in her way of dealing with the young. Llewellyn declared that he had rather go and dig in a ditch for his living than be dependent on her whims. I forgot to say, my dear, that by this time their fine fortune had melted like snow in the sun, and Celestia had much ado to make two ends meet. Well, Celestia bade him go, and, spite of Selina's tears and prayers, the boy left them one morning, and has never been heard of since — Gay, my dear, we are passing Slater's, and forgetting to match Sister Finetta's gray alpaca —"

"One minute, Auntie. Was it Llewellyn's loss that made Miss Celestia go insane?"

"Who can tell, child? From melancholy she passed into utter aberration; and Selina, though, as you know, less grievously afflicted, has gone under the same cloud. Do you think it would answer to trim it with a piping of gray satin? Would sister think it too smart?"

"Let us pipe it 'unbeknownst,'" said Gay, smiling, "and she won't have the heart to rip it off. Auntie, I can't think Llewellyn Stith had really a good heart, or it would have softened in time to those poor women who loved him so."

"'He will come back,' Selina said, at first repeating it day after day. Then she ceased to speak of him, and, before her poor heart was broken quite, lapsed into merciful oblivion."

"Oh, it was wicked, cruel!" cried Gay. "How I should like to tell him so!"

"My dear," said Miss Penelope, mildly, "that was five and thirty years ago."

II.

IN the autumn of 1859, to Gay, then a blooming lassie just beginning to find out her own good looks, occurred an event that in dull Belhaven had power to excite in her a temporary indifference to all human woe. Through an old friend of the family, a leader in the social world of Washington, she received an invitation to meet the party of the Prince of Wales on the occasion of his intended visit to Mount Vernon.

Although the visitor was only a lad, republican maids and matrons along the line of his travels were palpitating to secure such an opportunity as came unsought to our little homespun Gay. To her, in truth, it was less prince, more outing. She had not learned the importance of a hand-shake from budding royalty

under watch of a cordon of tutors and courtiers. Sufficient to fill her cup was the prospect of an entirely new frock made by Viney Piper, and a new ostrich-feather for her hat—one that might perchance—oh, thought of joy!—go entirely around the brim and rest upon the shoulder. Belhaven generally was content with simple tips.

"It is the Queen's eldest son, my dear, and we have always been fond of England," said Miss Penelope, fluttering. "I should n't wonder in the least if your Aunt Finetta should decide to unlock the wardrobe, and look up something of poor Lucilla's that you might wear."

Gay's eyes sparkled. She could never get over the thrill that ensued upon a hint of unlocking the wardrobe. But, in the mean time, there was the little sum set aside with careful consideration to purchase a new muslin, and new trimmings for her hat. And up King street, in Miss Pewee's window, she knew of a hat she meant to copy,—the sweetest wide-brimmed Leghorn encircled with a plume of pale rose-color, and topped with a knot of rose velvet,—a masterpiece of art. There could be no dawdling over the breakfast things that day.

As soon as Miss Penelope had "given out" supplies to Peggy and Susan, who with flour-measures and sugar-bowls and jugs attended her to the store-room, Gay hurried the old lady into her bonnet and shawl and away to the emporium of Miss Pewee, intending afterward to repair to Slater's for the purchase of her gown.

"Let you look at that hat in the window? Why, certainly, Miss Gay," exclaimed Eliza Pewee, cordially. "You'd best try it on, miss, for you can never get an idea—I'll vow, Miss Penelope, ma'am, I've yet to see anything set off Miss Gay like this."

Eliza, a member of Miss Penelope's Bible-class, was well trained in fundamentals; she spoke honest truth. How could any one fail to perceive the enchanting frame it made for Gay's waving locks and dusky, long-lashed eyes, her rose-bloom and her dimples? And, oddly enough, at that very moment, a strange young man stepped into the shop inquiring the way to the bookseller's, and, meeting Miss Gay's brown orbs full on his, blushed, apologized, and retired in great embarrassment.

"Came down on the boat from Wash'n'ton early this mornin'," explained Miss Pewee. "My sister noticed him when he got off. Seems foreign-like, don't you think so, ma'am? Has been pokin' around town all mornin'; quite the gentleman, I'd say. Now, Miss Gay, you really ought to let me send this home. Day before yesterday, when I took it out o' the New York packing-case, says I to Lizzie, it's the very thing

for Miss Gay Berkeley—oh, no trouble in the world, Miss Gay. I've the same untrimmed, certainly; and feathers, too, only not half so long."

While Gay's reluctant fingers turned over the milliner's exhibit of raw material; while Gay, sorely tempted, but aware that the price of the coveted hat would exhaust the money set aside for her complete outfit, tried to wonder how she could be satisfied with two tips and a ribbon bow instead of that lovely plume and the velvet sea-shell made by wonder-working fingers, Aunt Penelope was undergoing the same mental struggle. When Eliza Pewee, searching for the right shade, dived behind a curtain and disappeared back of the shop, Aunt Penelope cleared her throat, and spoke:

"Gay."

"Well, Aunt Pen?"

"My dear, I am not sure whether Sister Finetta would approve. I have always been partial to rose-color, and as this is the first time one of the royal family has visited Mount Vernon since the war, I think Virginians should make a little exertion. My love, if we buy this hat, what could be done about a frock for you?"

"O dearest Aunt Pen," cried the girl, radiantly, "let us have the old muslin washed."

As they were walking home,—Gay in an *après-moi-le-deluge* state of mind,—they ran again upon the strange young man coming out of the bookseller's with a parcel under his arm. They heard afterward (everything got about in Belhaven) that he had been trying to purchase any literature that might contain allusions to the early history of the town and its inhabitants.

"I suppose he is some young journalist from the North," said Miss Penelope. "Naturally enough, such people take interest in our town."

"His cheeks are as pink as my new ribbons," said Gay, "and he looks painfully shy and young. O Aunt Pen, you were a perfect darning to decide me about that hat."

And so the hat came home, was deposited in its bandbox on the Marseilles counterpane of the spare-room bed, was visited by Gay in her nightgown (to try it on again), by the Misses Bassett from next door, by Peggy and Susan and Cynthia from the kitchen, and in time became a proverb in the town.

On the day following, a family conclave gathered in the chill, speckless room wherein Great-Grandpapa Berkeley had given up the ghost, since inhabited in solitary state by his eldest daughter. It was a dusky chamber, with bed- and window-curtains of white dimity, the chief wall space occupied by a massive wardrobe of lustrous mahogany, before which, like a priestess

at the shrine, stood the grim figure of Aunt Finetta, keys in hand. The wide doors of the sanctuary, yet obstinately shut, reflected Gay's rosy face, her dark brows puckered in a frown of intense expectancy, side by side with Aunt Pen's drab puffs of hair and scarcely less anxious visage. In the corridor outside, in an agony of curiosity, hovered a little black girl, who would have given an eye or a tooth to cross the threshold. With a rattle and a clank, Miss Berkeley unlocked the wardrobe doors and swung them back. Forth stole upon pleased olfactories a scent of attar of rose that changed, ere one fairly had sniffed it, into that of Tonquin bean; then a tang of camphor struck the air. They caught visions of squat bandboxes covered with flowered wall-paper; of lacquered boxes, boxes of sandalwood, of Tunbridge Wells mosaic, of Italian olive-wood, cabas and bags of leather and satin, and of homelier green baize; of parcels wrapped in rice-paper, in silver-paper, in tissue-paper—all neatly ranged upon the shelves.

Gay's attention was fairly dazzled, roving between Lucilla's Mechlin pinner and the waistcoat with silver sprigs worn by great-grandpapa to the President's levee—between a pelisse of white satin, painted with ragged robins, and a "slip" of pale blue trimmed with tarnished silver fringe, in which Miss Finetta had danced a minuet with Colonel Aaron Burr. She handled a necklace of turquoise disks enframed in golden filigree, and let a long chain of aquamarines glide rippling through her hands, till recalled by an exclamation from Aunt Penelope.

"Sister! While you have the writing-desk in hand, suppose you let Gay see those miniatures of poor Selina and Llewellyn she gave us on the boy's eighteenth birthday. It is a long time since you had them out."

"Is *that* Miss Selina?" cried Gay, eagerly. "How perfectly lovely she was! O Auntie, there is no one so pretty now. And this—why—how odd—Llewellyn is exactly like the young man we saw buying books at Stringer's yesterday."

"My dear," said Miss Penelope, catching her breath, "you take me by surprise. It is hardly a subject to jest upon. Put away the pictures, child, and pray say nothing more about them. It is long since I have cared to look at either. There, sister, that is the organdie I spoke of—pink convolvulus on a white ground—so beautifully sheer—if Viney can't make it over for Gay, nobody can—pity it's a little yellow. To be sure, the Prince is but a lad, and he might not notice it is off the white."

But Miss Berkeley, standing erect and unsmiling, the filmy fabric flowing from her arms, answered not a word. She was thinking of the dead young sister who in her brief season had

been as full of the pride of youth and the flush of hope as Gay. With a deep sigh, she laid the dress in Miss Pen's lap, and when she spoke again it was to utter some moral reflections upon the duties and responsibilities of a prince, drawn from the fount of her favorite classic, Dr. Johnson's "Rasselas."

"Ting-a-ling-a-ling!" went the front-door bell. It was before visiting hours, and they knew that most of the ladies of their acquaintance were making pickles at the time.

The little black girl, fortified by duty, knocked boldly at the chamber door. When bidden to come in, her eyes wandered wildly on every side at once, trying to take in all she could while delivering her message.

"It's old Major Gyanett, miss; an' he axes to see de ladies mos' partic'lar."

"Penelope, you will go down at once," said Miss Berkeley. "I shall follow when I have put away the things."

Covertly adjusting her cap, Miss Pen obeyed. Gay accompanied her to the blue parlor, where they found the little gentleman walking up and down in great excitement.

"God bless my soul! Miss Penelope, ma'am, here's an extraordinary thing," said the old fellow. "News, after all these years, of Llewellyn Stith, who is married and living in England, and has sent his only surviving son to look us up. I'll declare to you, ma'am, that, in my hurry to let you know, I brought my cane and forgot my hat."

"One moment, David," said tremulous Miss Pen. "You will kindly not tell me any more till my sister comes down. My sister must be first to hear, of course."

So Gay was the seeress, after all. She listened with avidity to the Major's story when, Aunt Finetta arriving, he was free to rid his burning tongue of the strange tale. Llewellyn had gone to Australia in his youth, and there fell in with a relative of the elder branch of his father's family, whose daughter he married, and who, called back to England to inherit a good property, was now succeeded by his son-in-law. But although fortune had smiled on him, Llewellyn had known great sorrow. One member after another of his family had died off, leaving only the youngest son, Berkeley, named in memory of his kind friends in Belhaven, whom he had never ceased to love.

"Always the curse. I always said the curse would not be lifted till the legend of the ring came true—and oh! how can it come true?" interrupted Miss Penelope, at this point.

Gay's ears and eyes opened. What, oh, what *was* the legend of the ring?

"Penelope, you will oblige me by not interrupting Major Garnett," said Miss Berkeley, frowning.

"Not knowing what members of our families still survive, Llewellyn, who is an invalid, directed his son to make inquiries through the British minister in Washington. Lord L——, who is my very good friend, referred him at once to me, and after an effort to see me yesterday, when I was up the country, the boy returned to town to-day. It appears that poor Llewellyn feels that he cannot die without an effort to ask forgiveness of his aunts. Egad, ma'am, the trouble with me was how to tell the lad the condition of his afflicted relatives."

"Night and day since Llewellyn left her," said Miss Pen, tearfully, "Selina has worn around her neck a shirt-stud found on his dressing-table. Old Juno says she'd as soon think of offering to take it off as of removing the ring from her Miss Celestia's finger."

Again the ring. Gay's mind was intolerably busy with speculation. Why had she never heard of it? In the midst of her wondering came the direful commonplace of a summons from Peggy, to know if Miss Gay was ready to begin on the pickled mangos. She waited to hear Major Garnett add that the lad, who was a pleasant fellow, but shy and awkward, had promised to return to Belhaven within a day or two, and to make him a visit until they could decide upon what to do in the matter of carrying out the injunction of his father.

"To look at young Mr. Stith, one would not have thought he came of such a cold-blooded, hard-hearted father," mused Gay, who felt that she had at last obtained her dues in the matter of a genuine romance.

III.

"It was a beautiful autumn day," said the newspapers of the time, "when nature put on her gayest livery to welcome to the burial-place of Washington the heir to the Georges' throne."

Gay and the Major, who was to be her escort on the drive, were in the hall of the house in Princess Royal street waiting for Timson's hack. The little Major, over his best auburn scratch, wore a well-brushed beaver hat, his blue body-coat was smartly buttoned, his standing collar was snow-white, his black silk stock was tied jauntily, and he carried his great-grandfather's gold-headed stick. Miss Pen, surveying him with lambent tenderness, felt that he was a credit to the day.

Gay, attired in Lucilla's organdie, in Miss Pewee's champion hat, looked bewitching. Running out into the garden, she had picked for her belt a big bunch of "bleeding-hearts," and a smaller posy of the same for the Major's buttonhole. Now all was ready, and still the recreant Timson did not come.

"Tut, tut, tut!" said Miss Penelope. "I

suppose he forgot to have the window mended that rattled so. Well, I always did say I could trust Viney Piper to cut anything, though she was unlucky with my brown lustring a year ago last February, there's no denying it. How odd it seems for you to be going to meet the Prince, child, when one remembers the stand grandpapa took in the Revolution—though, to be sure, grandpapa had fought *with* the English in the French and Indian affairs. I must say it shows a very proper feeling in the Queen to let her son come. Dear, dear! if it should rain, if there's the least moisture in the air, I hope you will think about your feather all the time, child—mind you take particular note of the color of his hair and eyes, and remember all he says about the royal family. Here's good Miss Fanny Bassett, my dear, stepped in to see you dressed. Yes, Miss Fanny; we think our little girl looks very nice—Major, do you reckon anything could have hap—there's Timson at last, and, I declare, if he has n't got the little white horses with long tails that he drives to the baby funerals!"

Under the oak-trees on the Mount Vernon lawn had gathered a pleasant company. The silver-haired President with his fair, stately niece; Lord Lyons, genial Sir Henry Holland, the imposing Duke of Newcastle—these were most prominent in the *entourage* of the blond boy with courtly manners, who looked as if he would have liked to escape ceremonial, and enjoy Mount Vernon after some fashion of his own devising. Elsewhere, everywhere, were brilliant groups of fashionable folk, lighting up the greensward to the semblance of a Petit Trianon. Gay Berkeley, who had made her little reverence to the Prince, had been rallied and flattered by some of the oldsters of the suite, and was now followed by three or four young fellows eager for her smiles, was enjoying herself with the true gusto of a Virginia belle.

When the little Major came up to her in the box-walled garden to present Mr. Berkeley Stith, Gay found it a decided interruption to her festivities to have to stop to "draw out" this reserved English boy, who colored ~~to~~ the eyebrows when she spoke to him. Romance incarnate although he was, Mr. Stith would have been more in place in Belhaven limits. Somehow he did not harmonize with her high-heeled Spanish *attaché* or with the other glib and gilded youths who made up her train.

"Things are never quite what one expects them to be," mused the young lady, driving home, while the little long-tailed white horses, availing themselves of unprofessional opportunity, trotted briskly along. "It has been all delightful, but—but—I don't get on with Mr. Stith."

"He is very young," ventured the Major.

"That is n't it; I can always manage boys," said Gay, superbly. "If it were not absurd, I should say that he has especial reason to be afraid of me."

"In that hat you are undoubtedly dangerous, my dear," responded the gallant old gentleman.

"No; but really, Major Daisy, I tried so hard. I told him everything I know about Mount Vernon, even the old story about the lady who wept over the ice-house, mistaking it for the tomb. But nothing would cheer him up."

"You will be better friends when he comes to stop with me," said Major Daisy, with confidence.

But Gay held to her opinion; and when, the next afternoon, she heard the door-bell ring, prepared herself for a dull quarter of an hour.

"I seen cote-tails on de fron' po'ch, miss. 'Spec' it's students come to tea," said the little black girl, putting her head into Gay's room and irreverently alluding to the theological visitors most common in Belhaven streets.

"My dear, have you seen anything of my glasses?" said Miss Penelope, coming in with a card in hand. "O Cynthia, are you there? Run, look for my spec's, child, and hurry if you can."

"Dey ain' no use hurryin' 'less Miss Pen hurry too," said the small dark person, pointing her forefinger at the old lady's puffs. "'Ca'se dar dey is, bof pa'rs, certain shua."

"It is Mr. Stith, Auntie," explained Gay, glancing at the card. "If you and Aunt Fietta are ready to go down, do you think I need come quite yet?"

"You will accompany us, my dear. I should like nothing to be lacking in our welcome of the child of an old friend who thought enough of my papa to name his son for him."

When the Misses Berkeley, all prunes and prisms and best silk gowns, entered the blue parlor, Gay in their wake, they found the stranger, holding his hat behind his back, looking at the miniatures that hung in a row above the mantel-shelf. He turned, and, at the first look into his honest blue eyes, the two old women, seeing the unmistakable likeness to the long-absent Llewellyn, melted in kindness to the lad. Placing him between them on the haircloth sofa, they conducted the conversation in alternate rivulets of polite inquiry. Miss Pen, solicitous about his father's failing health, urged on him the propriety of sending at once to England a large supply of her Grandmama Berkeley's preparation of wild-cherry bark, tar, and honey; Miss Berkeley, elaborately unbending, contented herself with propounding oracles concerning the British government, the aristocracy, the Church, and customs of his na-

tive land. Gay, from her taboret in the window-seat, caught the humor of the scene. When, upon being pressed to say how the Queen was looking when he saw her last, Mr. Stith, turning his silk hat nervously, answered that, "It was at a flower-show, you know, and her Majesty was rather hot, and uncommonly red in the face," Gay, observing the shocked expression of her aunts, burst outright into laughter that went trilling through the empty spaces of the house. At which Berkeley Stith's young spirit overleaped conventionalities, and he too laughed. Dennis, coming in with a salver containing cake and wine, relieved the situation for both the lawless ones.

From this date Berkeley was adopted as one of them. He lost his constraint in the presence of their simple cordiality. The pleasant house, with its bare, polished floors, wide halls, old-fashioned furniture and customs, the jolly negro faces in every background, the smell of dried rose-leaves everywhere; the soft voices, to say nothing of the rich Southern beauty of the little maiden who already had him in her chains, made life there seem an afternoon of holiday from school.

They had talked much of the ways and means of introducing Berkeley to his father's aunts. Miss Penelope, indeed, had urged upon the lad the hopelessness of attempting to rouse either of them to recognition; but when, with quiet determination, he assured her that it was impossible for him to return to England, having neglected the effort to do so, Aunt Pen agreed to second him.

Gay had never set foot in the garden of the Poplars. She had seen the horse-chestnuts flower and drop over the high brick walls, and the long arms of distorted fruit-trees let fall, outside, pears and plums too hard and warped for even the milk-teeth of eager children of the street; but all within was a mystery like the contents of the house. When Aunt Penelope, coming to meet them at a door set in the ivy of the wall, unlocked it to admit her with Berkeley Stith and Major Garnett, the girl looked about her, full of awe.

Nothing so dreary as this tangle of neglected vegetation had come within her ken. Elsewhere, at this season, in the gardens of the town, rioted a glorious second crop of blossoms, richer in tint and sweeter of smell than those of summer-time. Here, so long had nature unpruned laid one layer of growth upon another, the foliage underneath was skeletonized and gray. The few flowers that had struggled into bloom were touched with blight. The great old sycamores, mulberries, and "paper-leaves" locked their boughs to make a twilight down below. Under the rotting arches of a grape-arcade there were two long tracks

worn by footsteps, distinct as the "beat" of prisoners in Old World dungeons, where, for half a century, Miss Selina had taken her daily exercise.

"Now, my dear, keep your spirits up," said Aunt Pen, in a cheerful whisper. "It will startle her less, I think, if you and the Major come in with Berkeley. Rain or shine, I've been visiting here this many a year, and I've met with nothing more alarming than mice; so pray, all of you, put off those doleful looks. I find from Juno that poor Celestia is very weak, though she's up and in her chair, as usual, in the room she's never left in twenty years. My plan is to have you come into the upper hall, where in old times the young people used to sit and chat around the bay-window seat, and let Selina find you there."

They mounted the stairs and sat, a silent trio, in the half light that filtered through panes overgrown outside with ivy. The paper of walls almost covered with mezzotints and steel-engravings, now obscured from sight by grime, hung in melancholy garlands; the fiddle-backed chairs ranged in rows around them were whole, but veiled in dust; across the open door of a bedroom opposite a spider had spun its web in full view. Another door was conspicuously closed. Not a sound smote upon their ears in the great voids of the silent house but their own quickened breathing and the buzzing of a blue-bottle fly attempting to escape to outer air.

"Oh, will Aunt Pen never come!" whispered Gay, at last, and Berkeley, who was next to her, took her hand in his, smiling at her wan looks.

The little Major, hat in hand, sat in a brown study, his eyes fixed upon the ground. He was living over a lifetime of joy and sorrow, of which the young things near him had tasted only the first drop. Gay felt herself shivering closer to Berkeley, who kept her hand in his firm clasp, saying not a word.

And then, led by Miss Penelope, who, with her arm around her waist, spoke in a low gentle whisper in her ear, there came to them a small, slight creature clothed in white, her flaxen hair, streaked with gray, hanging upon her neck, her wide, sad eyes looking at vacancy.

"Here are friends who love you, Selina," said Miss Penelope. "Look, my dear, and see if you do not remember David. And this is my little Gay, of whom I've often talked to you, and this is —"

"Llewellyn!" cried the poor lady, a look coming into her eyes, as if a lamp had been set into a dark casement. "Llewellyn, my own boy, you've come back to us at last!"

Berkeley Stith caught in his strong young arms the frail form that swayed toward him. At the same moment was heard from behind

the door of the closed room a shrill scream, and old Juno, running out like a spider from its lair, appeared among them.

"O my poor mistis, she's no mo'. My Miss Celestia's gone!" she cried. "Bress Jesus, dere's one on 'em he's taken to hisself. She's done passed away in sleep."

Miss Penelope looked in alarm at Selina's white face resting on Berkeley's shoulder, but it wore a smile of ineffable content. She had heard nothing, suffered nothing. The brief gleam of reason, giving her the desire of her heart for years, had faded, leaving her at peace.

Miss Selina made no resistance to the removal from her old home into a place where every care was lavished upon the remainder of her days. She was gentle, grateful, obedient; did not seem to realize her sister's death; and at a second meeting with her grandnephew showed no recognition of his presence. That she had, however, secretly visited the chamber of the dead, to remove from Celestia's finger a quaint ring of twisted gold, was proved by her last act before parting with Miss Penelope to go into her retreat.

"You will give this to Llewellyn, with our dear love," she said, laying the ring in her old friend's hand. "Celestia had been keeping it till he should come."

Berkeley could not trust himself to visit again the old house at the Poplars until the week after Miss Selina's departure. Already some people who had been put in charge had opened the deserted mansion to light and air; and with Gay the young man wandered through it, gazing curiously at the scene of the drama of death in life, so recently enacted.

"This will all be yours some day," said Gay. "I hope you will never let coarse, unfeeling people get possession of it, and tell its stories to gaping visitors."

"When this house goes from my hands, it shall go to destruction if I have my way," he answered. "But I can fancy certain conditions under which I should even like to live in it."

What those conditions were Gay did not press him to explain; nor were they apparently realized, since to-day, running close to the site of the old dwelling, destroyed by fire during the war, a railroad intersects the garden, and rows of small frame-houses have taken the place of the tangled bowers where Selina was wont to walk.

But when, some years later, Mr. Berkeley Stith came back to America to claim a bride, the ring used for the ceremony was one of the odd "gimmals" of the seventeenth century, made of blended links held together by a pair of golden hands, which, when separated, caused the circlet to drop into two parts. Within were inscribed these lines:

"When — With — This — Round — Trew — Hartes — Doe — Wedde — Y^e — Curse — Shalle — Pass — From — Stithe — Hysse — Hedde."

"So we are the legend of the ring?" said Gay, fingering it curiously, upon her bridal eve.

"Yes. At least my poor father, who in his last days took hold of the fancy with surprising persistence, made me promise to induce you to wear it at our marriage. I must own, however, that I believe in it just as much as I believe in our fabled curse, and as most people believe in their respectable old family ghosts."

"Take care! Peggy declares that it was this scoffing spirit on the part of the previous Stiths that brought about their woes."

"Our luck has turned since the day I saw

the dearest little girl in the world admiring herself in a milliner's looking-glass. I'll own to you now, Gay, that I fell so hopelessly in love with that hat that I was afraid to look you in the face next day, for fear of letting out my secret."

"Oh, I am so glad!" the girl cried gleefully. "To have been loved at first sight, and to be married with a legendary ring, realizes all my youthful dreams. I shall never be silly any more; but it is a final tribute to my foolish old romance."

If Gay had consulted Aunt Pen (now Mrs. David Garnett) and her husband, who gave the bride away, they might have told her that all of life's romance is not in the dreams of youth. But this, perhaps, in her happy married life, she has found out for herself.

Constance Cary Harrison.

MY ENEMY.

I.

MY foe was dark, and stern, and grim
I lived my life in fear of him.
I passed no secret, darkened nook
Without a shuddering furtive look,
Lest he should take me unawares
In some one of his subtle snares.
Even in broad noon the thought of him
Turned all the blessed sunlight dim,
Stole the rich color from the rose,
The perfume from the elder-blows.

I saw him not, I heard no sound;
But traces everywhere I found
Of his fell plotting. Now, the flower
Most prized lay blasted by his power;
From the locked casket, rent apart,
The jewel dearest to my heart
Was stolen; or, from out the dark,
Some swift blow made my heart its
mark.

Sweet eyes I loved grew glazed and
dim
That had but caught a glimpse of him;
And ears, were wont to hear each sigh
Of mine, were deafened utterly,
Even to my shrieks; and lips I pressed
Struck a cold horror to my breast.

This hath he done, my enemy.
From him, O God, deliver me!

II.

I reached but now this place of gloom
Through yon small gateway, where is room
For only one to pass. This calm
Is healing as a Sabbath psalm.
A sound, as if the hard earth slid
Down-rattling on a coffin-lid,
Was in mine ears. Now all is still,
And I am free to fare at will —
Whither? I seem but tarrying
For one who doth a message bring.

Who meets me in the way, whose face
Is radiant with an angel's grace?
Smiling, he saith in underbreath:
"I am thy foe long dreaded — Death."
"O Death, sweet Death, and is it *thou*
I called mine enemy but now?"
I place my trusting palms in his,
And lift my chill lips for his kiss.
"Press close, be near me to the end,
When all are fled, my one true friend!"
"Yea, *friend*," he answereth. "All, and more
Than all I took, do I restore.
Blossom and jewel, youth and hope,
And see, this little key doth ope
The shining portal that we see,
Beyond which — *love* awaiteth thee."

"O blinded eyes! Ah, foolish heart!
Adieu, dear Death — one kiss! We part."

Alice Williams Brotherton.

MIDDLE GEORGIA RURAL LIFE.

It has been asked why comparatively so many published character-sketches of the South have originated in the State of Georgia. In the opinion of the writer of this article, other causes besides accidental ones have operated in this behalf, and he purposes to suggest some of them.

Middle Georgia (for such contributions have come almost without exception from this region), settled by immigrants from the older States, chiefly Virginia and North Carolina, was found to be as salubrious as fertile. Its undulations of wide uplands and narrow lowlands watered by swiftly running small rivers and creeks, its thick forests beneath which was a soil radiant with redness and teeming with fecundity, made it as pleasant an abode for man as any in the whole South. Therein families of various degrees of culture and property got homesteads, not many less than two hundred, and fewer more than one thousand, acres. Almost every one owned one or two, almost none more than fifty, slaves. Fewer distinctions were among their dwelling-houses. The salubrity of the climate made settlements almost everywhere equally secure. Therefore those of all conditions became close neighbors of one another, and intimacies necessarily arose destined to produce important results variant, not only from those in other Southern States, but from those in the low-lying wire-grass and seaboard region of Georgia, wherein societies, constituted of English, Highland Scotch, and Salzburger, owing mainly to geographic and climatic conditions, kept for a century the distinctions that obtained at their establishment.

In a community constituted like that of Middle Georgia whatever was striking in individuality found unobstructed development in social intercourse that was untrammelled except by unwritten laws that excluded only what was indecent and unmanly. There were manifestations of the exuberant freedom of the rustic in that happy region that made him interesting enough to become the hero of a brief story of life and manners. He differed from the rustic of the seaboard as much as any French Switzer differs from the Italian or the German beyond the impassable mountain between them. Illustrative

of this difference, General Duncan L. Clinch, of Withlacoochee fame in the Seminole war, used to tell this anecdote. Accompanying the wagon of an up-country merchant going to Savannah for goods was a youth who felt that he might indulge himself for a few weeks with the sight of strange countries. What interested the traveler even more than the shipping were the inlets below the city that with the rising and ebbing tides flowed in contrary directions.

"And you call them things creeks, do you," he asked with disgust, "a-runnin' bofe ways? Well, my laws! the sooner I git back home the better for me and all parties."

His words being repeated to an ancient Salzburger, the latter said:

"He must be vone fool. If de vater run but vone way, it vill soon all run out, un den dey vill be not creek dere."

This seaboard man and his likes were to continue through a generation or two to be as they

A GEORGIA GENTLEMAN OF THE OLD SCHOOL.

were, while the hill-country greenhorn, through contact with benign influences, must make the development possible to his powers.

The Middle Georgian, always a politician, a free, often clamorous, sometimes a fighting

THE LAWYER.

voter, seldom aspired to the legislature or other positions wherein, besides being ridiculous, he might have proved a nuisance. His social rivalries began in country, commonly called "old-field," schools. Children of all conditions attended them during their formative years until a few left for college, and the rest for the plow and the hoe, or for the working-tools of the artisan. Here began intimacies and affections that no subsequent differences in culture or fortune were destined to change. Indeed the first settlers in Middle Georgia, although among them were some as well-born as any who ever came from the old States, or remained therein, organized society on a scale of simplest democracy. In general, every neighbor used to sit at every other neighbor's board, neither feeling that he was imparting or receiving favors other than such as flow from the needs and enjoyments of social existence,

proud of nothing so much as living in a region specially blessed by Heaven. Alexander H. Stephens used to recite a speech made at a dinner in Washington whereat were gentlemen from several States, among them a Georgian not accustomed to such occasions. He had already become embarrassed by listening to the toasts in compliment of the other States, and the graceful responses made by a citizen of each, and when Georgia was announced, vexed that nobody was there more competent to do justice to the theme, he rose with a feeling much like anger, and shouted:

"Gentlemen, dod-fetch it all! I can't make a speech; but that ain't goin' to hender me from drinkin' to the State o' Georgie. I'll do it, and I'll do it free. Here 's to her! She come from nobody, she ain't beholden on nobody, and you better believe she don't care a continental cent for nobody!"

It was a speech characteristic of the life that was led in that happy region fifty and sixty years ago, when the names and images of ancestors were counted of little importance compared with other things needed for the make-up of sound pioneer communities. A people so composed must put forth many an interesting specimen of individuality, with best opportunities for development. Hardy and industrious, yet they learned early the worth of leisure, and various were the devices for its entertainment. The books would be legion that should record the multifarious doings in old-field schools and other theaters wherein blossomed individualisms the fruit of which was a humor racy and abundant: as on the bench of a justice of the peace, on the witness-stand in the superior court, at the head of a battalion on the muster-field, where officers and men knew almost nothing, not only of the order and discipline, but of the words of military parade; above all, in the courtships of young men and maidens, bachelors and widows, with widowers to come in everywhere. Unrestrained intercourse among those of all conditions, the evenness with which life in general ran,—men of culture not only living but talking like their rude neighbors,—tended to inspire the more ignorant with ambition, always more pronounced in those least gifted to imitate the manners of refinement. In this connection it seems fit to remark that positions of petty prominence were sought in general by those whose behavior in the discharge of official functions was the more ludicrous according as they magnified their importance, and essayed to preside with corresponding gravity. As for courtships, they were as swift as fond. The Middle Georgia boy was a lover at ten, or thereabout, an announced suitor at sixteen, often a bridegroom at eighteen. In general he was not acquainted with the Muses, nor had he the winning phrase

of knight or troubadour; yet, feeling more intensely, because vaguely, the need to lay aside for the nonce his rude speech, he would pour forth, sometimes with tongue, sometimes on foolscap, volleys of fiery polysyllables, at whose audacious novelty his sweetheart might laugh till tears came to her eyes. Still she would lis-

regions from which the people had come. It may seem amiss to praise a vernacular so often regardless of the queen's English; yet it is certainly true that many of its peculiarities, arbitrary words, curt abbreviations, maxims and saws, substitution of the plural for the singular in nouns, assigning gender—especially the femi-

ten, and she would read, and she would endure to be entreated; for if she knew not for herself, wiser people than she would easily recognize that in spite of such wild efforts to surmount Parnassus, the possession of her would develop a manhood as sound as ever drew woman to lay her head upon a manly breast.

It was a saying of Aristotle that those who are to be leaders in societies should think like wise men, but speak as the common people. It is probable that in few if any communities has this maxim been pursued more closely than in Middle Georgia. In a society variously composite,—energetic pioneers coalescing for the purposes of this new life,—the speech of the common people, greatly in excess of numbers, must be the speech of all. Into this had been injected provincialisms according to the various

nine—to things inanimate, various modulations of tones and accentuations, made it not only pleasing to the ear, but very expressive. Not only in early, but in late periods, the ablest and most cultured men in the State, especially lawyers, employed it habitually in intercourse, not only with their clients, but with one another, just as in Scotland a century ago, when the most eminent judges and barristers in seasons of leisure were found to lapse into the *patois* of the people.

The tendencies of such social conditions, as they concern the question now being considered, were toward a thorough acquaintance among men of culture, particularly in the legal profession, with the peculiarities to which they themselves had contributed in giving development. A faithful sketcher of rural life in those times

must have known to intimacy and loved and admired this people, and in boyhood must have been as green as the greenest in order to be put into sympathy indispensable to the just performance of his task. Such were the raconteurs among the reunions of the bar at village taverns during the terms of courts. Young lawyers of to-day, even in Middle Georgia, know nothing, except by tradition, of the frolics of their predecessors, who used to follow in sulkies the judges of the Northern and Ocmulgee circuits, with their ten or twelve counties apiece, sojourning at taverns the capacities and appointments of which were wholly inadequate for their accommodation. A story is told of Judge Dooly of the Northern Circuit. A certain pig, of the species there called Landpike, whose generic leanness had not been overcome sufficiently to make him specially tempting, had been roasted whole, and for several days he lay untouched in his dish on the dinner-table. A severe judge was this habitually, yet he could be merciful on occasion. A day or two before adjournment, while at dinner, he was observed to look compassionately for some time at the deceased, and then, turning to the sheriff, who was sitting near, said softly:

"Mr. Sheriff, that pig has been faithful in his attendance upon the court ever since the beginning of the term, and has deported himself with such modesty and general propriety that this Court feels constrained to order his discharge upon his own recognizance."

The lawyers, accepting the situation cheerily, spent the long evenings in story-tellings about their neighbors, friends, one another, and even themselves, to be followed by shouts that when on the long piazza, and even sometimes when in the tavern hall, would be heard throughout the village, driving pious elderly ladies to wonder aghast, and perhaps to declare: "It do seem like them lawyers, big and little, little and big, keers for nothin' nor nobody. A body can't scarcely say their pra'ers, and git to sleep before midnight, when them ongodly people is here." Yet afterward, when told by their husbands or sons some of the jokes, they would laugh as heartily themselves.

The States of Alabama and Mississippi, with many large portions of Texas, are daughters of Middle Georgia, wherein was born

(they or their parents) a majority of those who are now leaders in public and private. These love the traditions, and fondly quote the sayings, of their rural forefathers, among whom were so many practical jokes, merry jestings, and the absurd drolleries that spring forth out of the exuberance of life in body, soul, and spirit.

What has been said about white people may be applied within degree to negro slaves. Their dwellings, almost without exception, were within call of their owners', and this contiguity

THE STORY-TELLER.

gave facilities for as great improvement as was possible to their condition. The young children of both races worked, played, wrestled, hunted, and fished together, and numberless were the affectionate relationships that, beginning in childhood, continued not only until emancipation, but beyond it. The slave of the average Middle Georgian regarded his master as the greatest and best of mankind, and loved him with a love that neither time nor war with its impoverishments and prostrations could subdue. Such relationships could not have existed in regions wherein masters and slaves dwelt apart. In this the influences exerted were benign to the bond and to the free.

To the latter they served to impart the ennobling that always attends manful regard for the being of the dependent, and they tempered the rudeness of the former in many ways, among them in leading to efforts, humble as they were, often most laughable, to imitate the graces of manner and speech of those upon whom they depended. No man who knows negroes well will believe that, with opportunities of reasonable fairness, in simple affectionateness, in readiness to make sacrifices, yes, in gratitude for just, humane treatment, they are below the standard of other races. It was owing to the relationships above mentioned that the State of Georgia, particularly its middle region, began so soon to recover from the desolation wrought by the late war between the States. The freedman there, after the first intoxication into which his simple being had been cast by the new feeling of his freedom, was quick—and but for unwise influences, particularly among native white people, would have been quicker—to recover his ancient poise, because he could not be driven to believe, like his kindred on the seaboard and in the river-bottoms, that emancipation had brought the millennium, and was destined apace to turn the world in general upside down. Therefore the two races could rejoin the forces that had been rent asunder, and move on harmoniously in their new careers. On many a plantation in Middle Georgia freedmen and their families are dwelling now as they dwelt before the war. The writer at this moment is thinking of a case touching for the memories of the old-time affectionateness it invokes. A gentleman in one of the old counties, once prosperous, now greatly reduced and in weak health, is maintained by one who was formerly his slave, is dressed by him in better clothes than he himself wears, and is treated with the same deference as of yore. To those who inquire the reasons for such action, he answers that his master is a gentleman, and that he shall not live other than as a gentleman ought to live as long as he can help it.

Conditions such as have been related made possible the creation of *Uncle Remus*. They made the negro more intelligent, more individual, and more interesting than most of his race elsewhere. A historian of him as he was must come from this very region, or one like it, and before these latter changing times were over; and if there ever was a rhapsodist to whom a people's love had descended to be fitly told, it was *Uncle Remus*. The negro is a born musician, and in his way a poet. He loves to see visions and to dream dreams, and to tell of them in solemn, mumbling, mysterious tones and words. *Uncle Remus* is a representative of the old-time negro whose master, when a good man, satisfied his ideas of human greatness.

Many times that little white child had sat before his cabin door, or by the log fire within, and listened, sometimes amused, oftener with awe, to tales of far-away times when the black man's ancestors, dwelling by the side of the corn-field amidst the humbler animals of the forest, became familiar with their domestic life and learned their various language. In the creation of this character not only genius and art were requisite, but oft-recurring opportunities to make acquaintance with the interior of this lowly life, goodness to sympathize with it, judgment to admire it, religiousness to reverence it. It was on the plantation of a good man in Putnam County, undulating among the lesser streams leading to the Oconee, that this country-born child learned what has so delighted the English-speaking world. Only there, or on some similar plantation, could the materials have been gathered in such profusion. Only an artist thoughtful and skilful, fond and native-born, could have rehearsed these in sequence so befitting. Only a gentle mind could have imparted the pathos, their chief excellency. *Uncle Remus* shows here and there that, like the aged minstrel in Newark Castle, he feels that he is among the last of his tribe to tell of the old order which he honors so well. Recollections in the midst of great political and social changes have fallen sadly upon his heart. Continuing at his work with an anxiety about results that formerly he did not have, realizing the uselessness of much faultfinding with some things that please him not, unable to put himself in full sympathy with all doings in the Church, yet he feels in his old age the need of being as religious as he can afford to be, considering the times. At night, when the child of those he loves best visits him as he sits and muses, tender fondness comes over his being, and he tells him the weird things the ancientness and significance of which the world knows not. None were more surprised than the author at the favor accorded by the public to his work. Although it was to him an actual embodiment culled out of his childhood among the red hills of Putnam, Joel Chandler Harris did not foresee how the learned and thoughtful everywhere would delight and marvel at the vividness of the reproduction.

Among the old-time negroes in the region that we have been considering was much of a humor very interesting. Their speech, by constant contact with the white man's, which it sought to imitate, had a curtness and vivacity never heard on large seaboard and river plantations. In the lightness of the negro's heart, with an imagination that never sought to be curbed, his words and his deportment often had a fun as racy as any lover of that article reasonably could wish to see. Even his complain-

ings, oftener than otherwise, were put forth with a resentment so peculiar as to provoke as well laughter as sympathy. Witness the following anecdote of the return to his old master, not very long ago, of one of his former slaves after having served another person for a year.

"Why, Jim, how happens it that you quit Perkins?" asked the gentleman.

"Well now, Marse Jack, I gwine up en tell you jes how 't is. I wuck fer dah man all las' year, en I wuck hard, en I make him a good crop. Well, now, de troof is, I did git f'om him a few, but, min' you, jes only a few, merlasses en tobarker, en one hat, en a pa'r o' shoes, en one little thing en 'nother. Well, den, Chris'mus come, en he say, 'Jim, I gwine make out our 'count.' En den he tuck he piece o' paper, en he pen, en he ink-vial, en he 'gin a-settin' down, en when he thoo wid dat job, he 'gin a-addin' up, en a-put'n' down, en a-kyar'n'; en he kyar'd, en he kep' on a-kyar'n', ontwel, bless your soul en body! Marse Jacky, when he got thoo, he done kyar's off all what was a-comin' to me! En so I makes up my min', I does, to leff dar, en pewoose myself back to you, whar I knows dey not gwine be no sich kyar'n' as dem." Then he joined heartily in the laugh raised by what had just occurred to him as being a good practical joke.

The country lawyer who, fifty years ago, traveled the judicial circuits aforementioned, met many a character as interesting as original. Not only were such specimens different, even in some matters of dialect, in various circuits, but militia districts in each had their *sui generis* representatives. Some of these, if they had been well known to him, must have suspended for a while the ever-flowing tears of the weeping philosopher.

When the lawyer traveled in a southerly or a southwesterly direction into the wire-grass region bordered by the Canoochee and the Ohooppee, he found other originals that have been sketched only rarely and briefly—interesting indeed, but neither so variant nor so racy, because, as is herein asserted with confidence, society there, besides consisting of a different people, was organized upon bases quite unlike that of the hill-country, and the few men of culture owning possessions there, who by a free intercourse might have developed, understood, and afterward described individualisms, lived in comparative seclusion, or had their residences in the large towns on the Savannah.

Sometimes public men from Georgia have been wondered at, perhaps sharply criticized,

for their carelessness of speech otherwheres than when seriously discussing before national tribunals subjects of national import. We have seen the causes of such apparent ignorance or obliviousness. If may be termed condescension the familiarity with which the greatest men of the State associated with their inferiors in natural

gifts, hereditary names, and educational advantages, to such degree of intimacy as to grow to love not only them, but their dialect and some of their manners, it was not felt so to be on the part either of one class or of the other. Did such condescension serve to let down one set from the standard which polite society likes to keep ever erect and exalted? Society leaders a generation ago did not thus complain of the elder Colquitt, Longstreet, Dawson, Jenkins, Cobb, Toombs, Stephens, and others of their time. The relaxations indulged at the Sunday dinners given by Mr. Stephens in his rooms at the National Hotel, Washington, were enjoyed not less by others, however eminent, than by the Georgians, some of whom were always sure to be there. Yet, during the meal, and afterward with cigars and a moderate circulation of the bottle, not only the dramatic but the narrative parts of anecdotes of Georgia production would be recited in the dear old dialect of which, even in his extreme age, none were more fond than the host.

OL' PAP'S FLAXEN.

BY HAMLIN GARLAND,

Author of "Main Traveled Roads," "Jason Edwards," etc.

"ANS', the next time you twist hay fer the fire, I wish 't you'd dodge the damp spots," said the cook, rising from a prolonged scrutiny of the stove and the bread in the oven.

"Cooks are always grumblin'," calmly remarked Anson, drawing on his gloves preparatory to going out to the barn; "but seein' 's this is Chris'mus, I'll go out an' knock a barrel to pieces. I want them biscuit to be O. K. See?"

"Yes; I see."

"Say, Bert!"

"Well?"

"Can't we have some sugar-'lasses on our biscuits, seein' it 's Chris'mus?"

"Well, I s'pose we can, Ans'; but we 're gittin' purty low on the thing these days, an' they ain't no tellin' when we 'll be able to git more."

"Well, jes as you say, not as I care." Anson went out into the roaring wind with a shout of defiance, but came back instantly, as if to say something he had forgotten. "Say, wha' d'ye s'pose is the trouble over to the Norsk's? I hain't seen a sign o' smoke over there fer two or three days."

"Well, now you speak of it, Ans', I've be'n thinkin' about that myself. I'm afraid he 's out o' coal, er sick, er somethin'. It 'u'd be mighty tough fer the woman an' babe to be there without fire, an' this blizzard whoopin' her up. I guess you'd better go over an' see what 's up. I was goin' to speak of it this mornin', but forgot it. I'm cook this week, so I guess the job falls on you."

"All right. Here goes."

"Better take a horse."

"No; I guess not. The snow is driftin' purty bad, an' he could n't git through the drifts, anyway."

"Well, look out fer yerself, ol' man. It looks purty owly off in the west. Don't waste any time. I'd hate like thunder to be left alone on a Dakota prairie fer the res' o' the winter."

Anson laughed back through the mist of snow that blew in the open door, his greatcoat and cap allowing only a glimpse of his cheeks.

The sky was bright overhead, but low down

around the horizon it did look "owly." The air was frightfully cold,—far below zero,—and the wind had been blowing almost every day for a week, and was still strong. The snow was sliding fitfully along the sod with a stealthy, menacing motion, and far off in the west and north a dense, shining cloud of frost was hanging.

The plain was almost as lone and level and bare as a polar ocean, where death and silence reign undisputedly. There was not a tree in sight, the grass was mainly burned, or buried by the snow, and the little shanties of the three or four settlers could hardly be said to be in sight, half buried as they were in drifts. A large white owl seated on a section stake was the only living thing to be seen.

The boom had not yet struck Buster County. Indeed it did not seem to Bert Gearheart at this moment that it would ever strike Buster County. It was as cold, dreary, and unprofitable an outlook as a man could face and not go utterly mad.

Bert watched his partner as he strode rapidly across the prairie, now lost to sight as a racing troop of snow-waves, running shoulder-high, shot between, now reappearing as the wind lulled.

"This is gittin' pretty monotonous, to tell the honest truth," muttered the cook as he turned from the little window. "If that railroad don't show up by March, in some shape or other, I'm goin' to give it up. Gittin' free land like this is a little too costly fer me. I'll go back to Wiscons', an' rent land on shares."

Bert was a younger-looking man than his bachelor companion; perhaps because his face was clean-shaven and his frame much slighter. He was a silent, moody young fellow, hard to get along with, though of great good nature. Anson Wood succeeded in winning and holding his love even through the trials of masculine housekeeping. As Bert kept on with the dinner, he went often to the little window facing the east and looked out, each time thawing a hole in the frost on the window-panes. The wind was rising again, and the night promised to be wild, as the two preceding nights had been. As he moved back and forth setting out their scanty meal, he was thinking of the old life

AMUSING FLAXIE.

ENGRAVED BY CHARLES STATE.

back in Wisconsin in the deeps of the little *coulée*; of the sleigh-rides with the boys and girls; of the Christmas doings; of the damp, thick-falling snow among the pines, where the wind had no terrors; of musical bells on swift horses in the fragrant deeps where the snowflakes fell like caresses through the tossing branches of the trees.

By the side of such a life the plain, with its sliding snow and ferocious wind, was appalling—a treeless expanse and a racing-ground for snow and wind. The man's mood grew darker while he mused. He served the meal on the rude box which took the place of table, and still his companion did not come. He looked at his watch. It was nearly one o'clock, and yet there was no sign of the sturdy figure of Anson.

The house of the poor Norwegian was about two miles away, and out of sight, being built in a gully; but now the eye could distinguish a house only when less than a mile away. A man could not at times be seen at a distance of ten rods, though occasional lulls in the wind permitted Bert to see nearly to the "First Moccasin."

"He may be in the swale," muttered the watcher as he stood with his eye to the loop-hole. But the next time he looked the plain was as wild and lone as before, save under the rising blast the snow was beginning to ramp and race across the level sod so fast that at times it looked like a sea running white with foam and misty with spray.

At two o'clock he said: "Well, I s'pose Ans' has concluded to stay over there to dinner, though what the Norsk can offer as inducement I swear I don't know. I'll eat, anyhow; he can have what's left."

He sat down to his lonely meal, and ate slowly, getting up two or three times from his candle-box in a growing anxiety for Ans', using the heated poker now to clear a spot on the pane. He expressed his growing apprehension, manlike, by getting angry.

"I don't see what the fool means by stayin' so late. It'll be dark by four o'clock, er jes as soon as that cloud over there strikes us. You could n't beat sense into some men's heads with a club."

He had eaten his dinner now, and had taken to pacing up and down the little room, which

was exactly six paces long and three wide, and just high enough to permit Anson to walk erect in the highest part.

"Nice fix to leave a man in, ain't it? All alone here, an' a blizzard comin' on! If I ever git out o' this country alive, I'll bet I'll know enough not to come back," he broke out, stamping his foot in a rage. "I don't see what he means by it. If he 's caught in that blow, his life ain't worth a cent."

At half-past two the feelings of the silent watcher began to change. He thought more about his partner out there in the rising wind and thickening snow. The blast roared round the little cabin with a deep, menacing, rising moan, and laid to the stovepipe a resounding lip, wailing and shouting weirdly. Bert's nervous walk accelerated, and he looked so often through the pane that the frost had not time to close up. Suddenly, out of the blinding, sweeping snow, not ten rods distant, the burly form of Anson burst, head down, blindly staggering forward into the teeth of the tempest. He walked like a man whose strength was almost gone, and he carried a large bundle in his arms.

Gearheart flung the door open, and called in a cheery voice to guide the struggling man to the house:

"Here ye are, ol' man! Right this way! Keep yer head down."

Then, seeing that Anson hardly made headway against the wind, he rushed out and, bare-headed as he was, caught and hurried him in, and shut the door. Reeling blindly, his breath roaring like a furnace, his eyebrows hung with icicles, his face masked with crusted snow, Anson staggered, crying hoarsely, "Take her!" then slid to the floor, where he lay panting for breath. Bert caught the bundle from his arms. A wailing, half-smothered cry came from it.

"What is it, Ans'?" he asked.

"A kid; warm it," said the giant, trying with his numbed fingers to undo the shawl which wrapped the bundle. Bert hurriedly unwound the shawl, and a frightened child, blue-eyed and flaxen-haired,—flossy as unfrosted corn-silk,—was disclosed like a nubbin of corn after the husks are stripped off.

"Why, it's little Flaxen! Wha' d' ye bring her over fer?"

"Sh!" said Anson, hoarsely. "Mind how ye get her warm! Don't ye see she 's froze?"

The little creature was about five, or possibly six, years old, scantily clad, but neat and pretty. As her feet began to get warm before the fire, she wailed with pain, which Bert tried to stop by rubbing.

"Put her hands in yer hair, hold her feet in yer hands—don't rub 'em," commanded Ans', who was stripping the ice from his eyelashes

and from his beard, which lay like a shield upon his breast. "Stir up the fire; give her some hot coffee an' some feed. She hain't had anythin' to eat."

Bert tried to do all these things at once, and could n't, but managed finally to get the child a piece of bread and a cup of coffee, and to allay her fears. Ans' began to recover from his horrible journey.

"Ol' man," he said solemnly and tenderly, "I came jes as near stayin' in that last gully down there as a man could an' not. The snow was up to my armpits, an' let me down wherever the weeds was. I had to waller; if it had n't be'n fer Flaxen, I guess I'd 'a' give up; but I jes grit my teeth, an' pulled through. There, guess ye had n't better let her have any more; I guess she 'll go to sleep now she 's fed an' warmed. Jes le' me take her now, ol' man."

"No; you get rested up."

"See here, it 'll rest me to hold that little chap. I'm all right. My hands is frosted some, an' my ears, that 's all, but my breath is git-tin' back. Come on, now."

Bert-surrendered the child, who looked up into the bearded face of the rough fellow, then rested her head on his breast, and went to sleep at last. It made his heart thrill as he felt her little head against his breast. He never had held a child in his arms before.

"Say, Bert, reckon I 'm purty fair picture of a family man, now, eh? Throw in a couple o' twists more o' hay—"

"Say, now the little one is off, what 's up over to the Norsk's? Wha' d' ye bring the child fer?"

"'Cause she was the only livin' soul in the shanty."

"What!"

"Fact."

"Where 's the Norsk?"

"I don't know. On the prairie somewhere."

"An' the mother?"

"She 's—" Here the little one stirred slightly as he leaned forward, and Ans' said, with a wink, "She 's asleep. Be a little careful what ye say—jes now; the little rat is listenin'. Jes say relative when ye mean her—the woman, ye know."

"Yes, sir," he resumed after a moment; "I was scart when I saw that house—when I knocked, an' no one stirred er come to the door. They was n't no tracks around, an' the barn and house was all drifted up. I pushed the door open; it was cold as a barn, an' dark. I could n't see anythin' fer a minute, but I heard a sound o' cryin' from the bed that made my hair stand up. I rushed over there, an' there lay the mother on the bed, with nothin' on but some kind of a night-dress, an' everythin'—dress,

shawl, an' all — piled on an' around that blessed child."

"She was dead?"

"Stone-dead. I could n't believe it at first. I raved around there, split up a chair an' the shelves, an' made a fire. Then I started to rub the woman's hands an' feet, but she was cold an' hard as iron. Then I took the child up an' rubbed her; tried to find somethin' fer her to eat — not a blessed thing in that house! Finally I thought I better bolt fer home —"

"Lucky ye did. Hear that wind! Great heavens! We are in fer another two-days' blow of it. That woman of course stripped herself to save the child."

"Yes; she did."

"Jes like a woman! Why did n't she rip down the shelf an' split up the chairs fer fuel, er keep walkin' up an' down the room?"

"Now, there it is. She had burnt up a lot o' stuff, then took to bed with the child. She rolled her up in all the quilts an' shawls an' dresses they was in the house, then laid down by the side o' her, an' put her arm over her — an' froze — jes like a mother — no judgment!"

"Well, lay her down now, an' eat somethin', while I go out an' look after the chores. Lord! it makes me crawl to think of that woman layin' there in the shanty all alone. Say, did ye shut the door?"

"Yes; an' it shuts hard. The wind ner wolves can't open it."

"That 's good. I could n't sleep nights if I thought the coyotes could get in."

By four o'clock it was dark, and the lamp was lighted when Bert came in, bringing an immense load of hay-twists. The ferocious wind, as if exulting in its undisputed sway over the plain, raved in a ceaseless fury around the cabin, and lashed the roof with a thousand stinging streams of snow. The tiny shanty did not rock; it shuddered as if with fright. The drifts rose higher on the windows, and here and there through some unseen crevice the snow, fine as bolted flour, found its way like oil, seeming to penetrate the solid boards; and to the stovepipe the storm still laid hoarse lip, piping incessantly, now dolorously, now savagely, now high, now low.

While the two men sat above the fire that night, discussing the sad case of the woman, the child slept heavily, muttering and sobbing in her sleep.

"The probabilities are," said Anson, in a matter-of-fact way, "the Norsk took his oxen an' started fer Summit fer provisions, an' got caught in this blizzard an' froze to death somewhere — got lost in some gully, probably."

"But why did n't he come an' tell us to look after his fam'ly?"

"Well, I s'pose he was afraid to trust us. I don't wonder, as I remember the treatment that women git from the Yankees. We look a good 'eal worse than we are, besides; an' then the poor cuss could n't talk to us, anyhow, an' he 's be'n shy ever since he came, in October."

After a long silence, in which Gearheart went over and studied the face of the sleeper, Anson said: "Well, if he 's dead, an' the woman 's dead too, we 've got to look after this child till some relative turns up. An' that woman 's got to be buried."

"All right. What 's got to be done had better be done right off. We 've only one bed, Ans', an' a cradle has n't appeared necessary before. How about the sleepin' to-night? If you 're goin' into the orphan-asylum business, you 'll have to open up correspondence with a furniture-store."

Ans' reddened a little. "It ain't mine any more 'n yours. We 're pardners in this job."

"No; I guess not. You look more like a dad, an' I guess I 'll shift the responsibility of this thing off on to you. I 'll bunk here on the floor, an' you take the child an' occupy the bed."

"Well, all right," answered Anson, going over in his turn and looking down at the white face and tow-colored hair of the little stranger. "But say, we ain't got no night-clothes fer the little chap. What 'll we do? Put her to sleep jes as she is?"

"I reckon we 'll have to to-night. Maybe you 'll find some more clothes over to the shanty. The woman would n't burn up any of the baby's duds — bet yer life!"

"Say, Bert," said Ans' later.

"Well?"

"It 's too darn cold fer you to sleep on the floor there. You git in here on the back side, an' I 'll take the child on the front. She 'd be smashed flatter 'n a pancake if she was in the middle. She ain't bigger 'n a pint o' cider, anyway."

"No, ol' man. I 'll lay here on the floor, an' kind o' heave a twist in once in a while. It 's goin' to be cold enough to freeze the tail off a brass bull by daylight."

Ans' bashfully crept in beside the sleeping child, taking care not to waken her, and lay there thinking of his new rôle of father. At every shiver of the cowering cabin, and rising shriek of the wind, his heart went out in love toward the helpless little creature whose dead mother lay in the cold and deserted cabin, and whose father was wandering perhaps breathless and despairing on the plain, or lying buried in the snow in some deep ravine beside his patient oxen. He tucked the clothing in carefully about the child, felt to see if her little feet were cold,

and covered her head with her shawl, patting her lightly with his great paw.

"Say, Bert!"

"Well, Ans', what now?"

"If this little chap should wake up an' cry fer its mother, what in thunder would I do?"

"Give it up, ol' boy," was the reply from the depths of the buffalo-ropes before the fire. "Pat her on the back, an' tell her not to cry, er somethin' like that."

"But she can't tell what I say."

"Oh, she 'll understand if ye kind o' chuckle an' goo like a fam'ly man." But the little one slept on, and when, about midnight, Bert got up to feed the fire, he left the stove door open to give light, and went softly over to the sleepers. Ans' was sleeping with the little form close to his breast, and the poor troubled face safe under his shaggy beard.

And all night long the blasting wind, sweeping the sea of icy sands, hissed and howled round the little sod cabin like surf beating on a half-sunken rock. The wind and the snow and the darkness possessed the plain; and Cold (whose other name is Death) was king of the horrible carnival. It seemed as though morning and sunlight could not come again, so absolute was the sway of night and death.

When Anson woke the next morning, he found the great flower-like eyes of the little waif staring straight into his face with a surprise too great for words or cries. She stared steadily and solemnly into his open eyes for a while, and when he smiled she smiled back; but when he lifted his large hand and tried to brush her hair she grew frightened, pushing her little fists against him, and began to cry for "mooder."

This roused Gearheart, who said: "Well, pap, what are ye goin' to do with that child? This is your mornin' to git breakfast. Come, roll out. I 've got the fire goin' good. I can't let ye off; it 'll break up our system."

Anson rolled out of the bunk, and dressed hurriedly in the cold room. The only sound was the roar of the stove devouring the hay-twist.

"Thunder an' black cats, ain't it cold! The wind has died down, er we 'd all be froze stiffer 'n a wedge. It was mighty good in ye, ol' man, to keep the stove goin' durin' the night. The child has opened her eyes brighter 'n a dollar, but I tell ye I don't like to let her know what 's happened to her relatives."

The little one began to wail in a frightened way, being alone in the dim corner.

"There she goes now; she 's wantin' to go home. That 's what she 's askin', jes like 's no. Say, Bert, what the devil can I do?"

"Talk to her, Ans'; chuckle to her."

"Talk! She 'll think I 'm threatenin' to knock

her head off, er somethin'. There, there, don't ee cry! We 'll go see papa soon—confound it, man, I can't go on with this thing! There, there! See, child, we 're goin' to have some nice hot pancakes now; goin' to have breakfast now. See, ol' pap 's goin' to fry some pancakes. Whoop! see!" He took down the saucepan, and flourished it in order to make his meaning plainer.

"That 's as bad as your fist. Put that down, Ans'. You 'll scare the young one into a fit; you ain't built fer a jumpin'-jack."

The child did indeed set up a louder and more distracting yell. Getting desperate, Anson seized her in his arms and, despite her struggles, began tossing her on his shoulder. The child saw his design, and ceased to cry, especially as Gearheart began to set the table, making a pleasant clatter, whistling the while. The glorious light of the morning made its way only dimly through the thickly frosted window-panes; the boards snapped in the horrible cold; out in the barn the cattle were bellowing and kicking with pain.

"Do you know," said Bert, impressively, "I could n't keep that woman out o' my mind. I could see her layin' there without any quilts on her, an' the mice a-runnin' over her. God! it 's tough, this bein' alone on a prairie on such a night."

"I knew I 'd feel so, an' I jes naturally covered her up an' tucked the covers in, the child a-lookin' on. I thought she 'd feel better, seein' her ma tucked in good an' warm. Poor little rat!"

"Did you do that, ol' man?"

"You bet I did! I could n't have slept a wink if I had n't."

"Well, why did n't ye tell me, so 't I could sleep?"

"I did n't think ye 'd think of it that way, not havin' seen her."

The child now consented to sit in one of the chairs and put her feet down by the stove. She wept silently now, with that infrequent, indrawn sob, more touching than wails. She felt that these strangers were her friends, but she wanted her mother. She ate well, and soon grew more resigned. She looked first at one and then at the other of the men as they talked, trying to understand their strange language. Then she fell to watching a mouse that stole out from behind the flour-barrels, snatching a crumb occasionally and darting back, and laughed gleefully once, and clapped her hands.

"Now the first thing after the chores, Ans', is that woman over there. Of course it 's out o' the question buryin' her, but we 'd better go over an' git what things there is left o' the girl's, an' fasten up the shanty to keep the wolves out."

"But then—"

"What?"

"The mice. You can't shut them out."

"That's so. I never thought o' that. We've got to make a box, I guess; but it's goin' to be an awful job fer me, Ans', to git her into it. I thought I would n't have to touch her."

"Le' me go; I've seen her once, an' you hain't."

"Heaven an' earth! what could I do with the babe? She'd howl like a coyote, an' drive me plumb wild. No; you're elected to take care o' the child. I ain't worth a picayune at it. Besides, you had your share yesterday."

And so, in the brilliant sunshine of that bitterly cold morning, Gearheart crunched away over the spotless snow, which burned under his feet—a land mocking, glorious, pitiless. Far off some slender columns of smoke told of two or three hearth-fires, but mainly the plain was level and lifeless as the polar ocean, appallingly silent, no cry or stir in the whole expanse.

It required strong effort on the part of the young man to open the door of the cottage, and he stood for some time with his hand on the latch, looking about. There was perfect silence without and within, no trace of feet or hands anywhere. All was as peaceful and unbroken as a sepulcher.

Finally, as if angry with himself, Gearheart shook himself and pushed open the door, letting the morning sun stream in. It lighted the bare little room and fell on the frozen face and rigid, half-open eyes of the dead woman, with a strong, white glare. The thin face and worn, large-jointed hands lying outside the quilt told of the hardships which had been the lot of the sleeper. Her clothing was clean, and finer than one would expect to see.

Gearheart stood looking at her for a long time, the door still open, for he felt reinforced, in some way, by the sun. If any one had come suddenly and closed the door on him and the white figure there, he would have cried out and struggled like a madman to escape, such was his unreasoning fear of the dead.

At length, with a long breath, he backed out, and closed the door. Going to the barn, he found a cow standing at an empty manger, and some hens and pigs frozen in the hay. Looking about for some boards to make a coffin, he came upon a long box in which a reaper had been packed, and this he proceeded to nail together firmly, and to line with pieces of an old stovepipe at such places as he thought the mice would try to enter.

When it was all prepared, he carried the box to the house and managed to lay it down beside the bed; but he could not bring himself to touch the body. He went out to see if some one was not coming. The sound of a human voice would

have relieved him at once, and he could have gone on without hesitation. But there was no one in sight, and no one was likely to be; so he returned, and, summoning all his resolution, took one of the quilts from the bed, and placed it in the bottom of the box. Then he removed the pillow from beneath the head of the dead woman, and placed that in the box. Then he paused, the cold moisture breaking out on his face. Like all young persons born far from war, and having no knowledge of death even in its quiet forms, he had the most powerful repugnance toward a corpse. He kept his eye on it as though it were a sleeping horror, likely at a sudden sound to rise and walk. More than this, there had always been something peculiarly sacred in the form of a woman, and in his calmer moments the dead mother appealed to him with irresistible power.

With a sort of moan through his set teeth, he approached the bed, and threw the sheet over the figure, holding it as in a sling; then, by a mighty effort, he swung it stiffly off the bed into the box.

He trembled so that he could hardly spread the remaining quilts over the dead. The box was wide enough to receive the stiff, curved right arm, and he had nothing to do but to nail the cover on, which he did in feverish haste. Then he rose, grasped his tools, rushed outside, slammed the door, and set off in great speed across the snow, pushed on by an indescribable horror.

As he neared home, his fresh young blood asserted itself more and more; but when he entered the cabin he was still trembling, and dropped into a chair like a man out of breath. At sight of the ruddy face of Anson, and with the aid of the heat and light of the familiar little room, he shook off part of his horror.

"Gi' me a cup o' coffee, Ans'. I'm kind o' chilly an' tired."

Before drinking he wiped his face and washed his hands again and again at the basin in the corner, as though there were something on them which was ineffably unclean. The little one, who had been weeping again, stared at him with two big tears drying on her hollow cheeks.

"Well?" interrogated Anson.

"I nailed her up safe enough fer the present. But what're we goin' to do next?"

"I can't see 's we can do anythin' as long as such weather as this lasts. It ain't safe fer one of us to go out an' leave the other alone. Besides, it's thirty below zero, an' no road, Moccasin's full of snow, an' another wind likely to rise at any time. It's mighty tough on this little one, but it can't be helped. As soon as it moderates a little, we'll try to find a woman an' a preacher, an' bury that—relative."

"The only woman I know of is ol' Mrs.

Cap Burdon, down on the Third Moccasin, full fifteen miles away."

For nearly two weeks they waited, while the wind alternately raved and whispered over them as it scurried the snow south or east, or shifted to the south in the night, bringing "the north end of a south wind," the most intolerable and cutting of winds. Day after day the restless snow sifted or leaped across the waste of glittering crust; day after day the sun shone in dazzling splendor, but so white and cold that the thermometer still kept down among the thirties.

These were long days for the settlers. They would have been longer for Anson and Bert had it not been for little Elga, or "Flaxen," as they took to calling her. They racked their brains to amuse her, and, in the intervals of tending the cattle and of cooking, or of washing dishes, rummaged through all their books and pictures, taught her "cat's-cradle," played "jack-straws" with her, and with all their resources of song and pantomime strove to fill up the little one's lonely days, happy when they succeeded in making her laugh.

"That settles it!" said Bert one day, whanging the basin back into the empty flour-barrel.

"What 's the matter?"

"Matter is, we 've reached the bottom o' the flour-barrel, an' it's got to be filled; no two ways about that. We can get along on biscuit an' pancakes in place o' meat, but we can't put anythin' in the place o' bread. If it looks favorable to-morrow, we 've got to make a break fer Summit, an' see if we can't stock up."

Early the next morning they brought out the shivering team and piled into the box all the quilts and robes they had, and, bundling little Flaxen in, started across the trackless plain toward the low line of hills to the east, twenty-five or thirty miles away. From four o'clock in the morning till nearly noon they toiled across the sod, now plowing through the deep snow where the unburned grass had held it, now scraping across the bare, burned earth, now wandering up or down the swales, seeking the shallowest places, now shoveling a pathway through. The sun rose unobscured as usual, and shone down with unusual warmth, which afforded the men the satisfaction of seeing little Flaxen warm and merry. She chattered away in her own tongue, and clapped her little hands in glee at sight of the snowbirds running and fluttering about. As they approached the low hills, the swales got deeper and more difficult to cross, but about eleven o'clock they came to Burdon's ranch, a sort of half-way haven between their own claim and Summit, the end of the railroad.

Captain Burdon was away, but Mrs. Burdon, a big, slatternly Missourian, with all the kindness of a universal mother in her swarthy

face and flaccid bosom, ushered them into the cave-like dwelling set in the sunny side of Water Moccasin.

"Set down; set down. Young uns, git out some o' them chairs, an' let the strangers set. Purty tol'able tough weather? A feller don't git out much such weather as this 'ere 'thout he 's jes naturally 'bleeged to. Suse, heave in another twist, an' help the little un to take off her shawl."

After Mrs. Burdon's little flurry of hospitality was over, Anson found time to tell briefly the history of the child.

"Heavens to Betsey! I wan' to know!" she cried, her fat hands on her knees and her eyes bulging. "Wal, wal! I declare, it beats the Dutch! So that woman jes frizzed right bur-side the babe! Wal, I never! An' the ol' man he ain't showed up? Wal, now, he ain't likely to. I reckon I saw that Norsk go by here that very day, an' I says to Cap'n, says I, 'If that feller don't reach home inside an hour, he 'll go through heaven a-gitt'n' home,' says I to the Cap'n."

"Well, now," said Anson, stopping the old woman's garrulous flow, "I 've got to be off fer Summit, but I wish you 'd jes look after this little one here till we git back. It's purty hard weather fer her to be out, an' I don't think she ought to."

"Yaas; leave her, o' course. She 'll enj'y playin' with the young uns. I reckon ye did all ye could for that woman. Ye can't burry her now; the ground's like linkum-vitæ."

But as Anson turned to leave, the little creature sprang up with a torrent of wild words, catching him by the coat, and pleading strenuously to go with him, her accent unmistakable.

"You wan' to go with Ans'?" he inquired, looking down into the little tearful face with a strange stirring in his bachelor heart. "I believe on my soul she does."

"Sure 's yer born!" replied Mrs. Burdon. "She 'd rather go with ye than to stay an' fool with the young uns; that 's what she 's tryin' to say."

"Do you wan' to go?" asked Ans' again, opening his arms. She sprang toward him, lifting her eager little hands as high as she could, and when he lifted her she twined her arms around his neck.

"Poor little critter! she ain't got no pap ner mam now," the old woman explained to the ring of children, who still stared silently at the stranger almost without moving.

"Ain't he her pa-a-p?" drawled one of the older girls, sticking a finger at Anson.

"He is now," laughed Ans', and that settled the question over which he had been pondering for days. It meant that as long as she wanted to stay she should be his Flaxen and

he would be her "pap." "And you can be Uncle Bert, hey?" he said to Bert.

"Good enough," said Bert.

THEY never found any living relative, and only late in the spring was the fate of the poor father revealed. He and his cattle were found side by side in a deep swale, where they had foundered in the night and tempest.

As for little Flaxen, she soon recovered her cheerfulness, with the buoyancy natural to childhood, and learned to prattle in broken English very fast. She developed a sturdy self-reliance that was surprising in one so young, and long before spring came was indispensable to the two "old baches."

"Now, Bert," said Ans' one day, "I don't wan' to hear you talk in that slipshod way any longer before Flaxen. You know better; you've had more chance than I have—be'n to school more. They ain't no excuse fer you, not an ioty. Now I 'm goin' to say to her, 'Never mind how I talk, but talk like Bert does.'"

"Oh, say, now look here, Ans', I can't stand the strain. Suppose she 'd hear me swearin' at ol' Barney er the stove?"

"That 's jes it. You ain't goin' to swear," decided Anson; and after that Bert took the education of the little waif in hand, for he was a man of good education, his use of dialect and slang being simply due to carelessness.

But all the little fatherly duties and discipline fell to Anson, and much perplexed her often got. For instance, when he bought her a new outfit of clothing at the store, they were strange to her and to him, and the situation was decidedly embarrassing.

"Now, Flaxie, I guess this thing goes on this side before, so 's you can button it, see? If it went on so, you could n't reach around to button it, see? I guess you 'd better try it so. An' this thing, I judge, is a shirt, an' goes on under that other thing, which I reckon is called 'a shimmy. Say, Bert, should n't you call that a shirt?" holding up a garment.

"W-e-l-l, yes" (after a close scrutiny).
"Yes; I should."

"And this a shimmy?"

"Well, now you've got me, Ans'. It seems to me I've heard the women folks at home talk about shimmies, but they were always kind o' private about it, so I don't think I can help you out. That little thing goes underneath, sure enough."

"All right, here goes, Flax; if it should turn out to be hind side before, no matter."

Then again little Flax would want to wear her best dress on week-days, and Ans' was unable to explain. Here again Bert came to the rescue.

"Git her one dress fer ev'ry day in the week,

an' make her wear 'em in rotation. Hang 'em up, an' put a tag on each one, Sunday, Monday, an' so on."

"Good idea."

And it was done. But the embarrassments of attending upon the child soon passed away; she quickly grew independent of such help, dressed herself, and combed her own hair, though Anson enjoyed doing it himself when he could find time, and she helped out not a little about the house. She seemed to have forgotten her old life, awakening as she had from almost deathly torpor into a new home—almost a new world—where a strange language was spoken, where no woman was, and where no mention of her mother, father, or native land was ever made before her. The little waif was at first utterly bewildered, then reconciled, and by the time spring came over the prairie was almost happy in the touching way of a child ignorant of childish things.

Oh, how sweet spring seemed to those snow-weary people! Day after day the sun crept higher up in the sky; day after day the snow gave way a little on the swells, and streams of water began to trickle down under the huge banks of snow filling the ravines; and then came a day when a strange warm wind blew from the northwest. Soft and sweet and sensuous it was, as the breeze sweeping some tropic bay filled with a thousand isles—a wind like a vast warm breath blown upon the land. Under its touch the snow did not melt; it vanished. It fled in a single day from the plain to the gullies. Another day, and the gullies were rivers. It was the "chinook," which old Lambert, the trapper and surveyor, said came from the Pacific Ocean.

The second morning after the chinook began to blow, Anson sprang to his feet from his bunk, and, standing erect in the early morning light, yelled:

"Hear that?"

"What is it?" asked Bert.

"There! Hear it!" Anson smiled, holding up his hand joyfully, as a mellow "Boom—boom—boom" broke through the silent air. "Prairie-chickens! Hurrah! Spring has come! That breaks the back o' winter short off."

"Hurrah! de 'pring ees come!" cried little Flaxen, gleefully clapping her hands in imitation.

No man can know what a warm breeze and the note of a bird can mean to him till he is released, as these men were released, from the bondage of a horrible winter. Perhaps still more moving was the thought that with the spring the loneliness of the prairie would be broken, never again to be so dread and drear: for with the coming of spring came the tide of land-seekers pouring in; teams scurried here

and there on the wide prairie, carrying surveyors, land-agents, and settlers. At Summit trains came rumbling in by the first of April, emptying thousands of men, women, and children upon the sod, together with cattle, machinery, and household articles, to lie there roofed only by the blue sky. Summit, from being a half-buried store and a blacksmith's shop, bloomed out into a town with saloons, lumber-yards, hotels, and restaurants; the sound of hammer and anvil was incessant, and trains clanged and whistled night and day.

Day after day the settlers got their wagons together and loaded up, and then moved down the slope into the fair valley of the sleepy James. Mrs. Cap Burdon did a rushing business as a hotel-keeper, while Cap sold hay and oats at rates which made the land-seekers gasp.

"I'm not out here fer my health," was all he would vouchsafe.

Soon all around the little shanties of Anson and Bert other shanties were built and filled with young, hopeful, buoyant souls. The railroad surveyors came through, locating a town about three and another about twelve miles away, and straightway the bitter rivalry between Boomtown and Belleplain began. Belleplain being their town, the partners of our story swore by Belleplain, and correspondingly decided the claims of Boomtown.

With the coming of spring began the fiercest toil of the pioneers—breaking the sod, building, harvesting, plowing; then the winter again, though not so hard to bear; then the same round of work again. So the land was settled, the sod was turned over; sod shanties gave way to little frame-houses; the tide of land-seekers passed on, and the real workers, like Wood and Gearheart, went patiently, steadily on, founding a great State.

(To be continued.)

Hamlin Garland.

THE SILVER THAW.

THERE came a day of showers
Upon the shrinking snow;
The south wind sighed of flowers,
The softening skies hung low.
Midwinter for a space
Foreshadowing April's face,
The white world caught the fancy
And would not let it go.

In reawakened courses
The brooks rejoiced the land;
We dreamed the spring's shy forces
Were gathering close at hand.
The dripping buds were stirred,
As if the sap had heard
The long-desired persuasion
Of April's soft command.

But antic Time had cheated
With hope's elusive gleam;
The phantom spring defeated
Fled down the ways of dream.
And in the night the reign
Of winter came again,
With frost upon the forest
And stillness on the stream.

When morn in rose and crocus
Came up the bitter sky,
Celestial beams awoke us
To wondering ecstasy.
The wizard winter's spell
Had wrought so passing well
That earth was bathed in glory
As though God's smile were nigh.

The silvered saplings bending
Flashed in a rain of gems;
The statelier trees attending
Blazed in their diadems.
White fire and amethyst
All common things had kissed,
And chrysolites and sapphires
Adorned the bramble stems.

In crystalline confusion
All beauty came to birth;
It was a kind illusion
To comfort waiting earth—
To bid the buds forget
The spring so distant yet,
And hearts no more remember
The iron season's dearth.

Charles G. D. Roberts.

THE NATURE AND ELEMENTS OF POETRY.¹

I. ORACLES OLD AND NEW.

POETRY of late has been termed^a a force, or mode of force, very much as if it were the heat, or light, or motion known to physics. And, in truth, ages before our era of scientific reductions, the *energia*—the vital energy—of the minstrel's song was undisputed. It seems to me, in spite of all we hear about materialism, that the sentiment imparting this energy—the poetic impulse, at least—has seldom been more forceful than at this moment and in this very place.

Our American establishments—our halls of learning and beauty and worship—are founded, as you know, for the most part not by governmental edict; they usually take their being from the sentiment, the ideal impulses, of individuals. Your own institute,² still mewing like Milton's eagle its mighty youth, owes its existence to an ideal sentiment, to a most sane poetic impulse, in the spirit of its founder, devoted though he was, through a long and sturdy lifetime, to material pursuits. Its growth must largely depend on the awakening from time to time, in other generous spirits, of a like energy, a similarly constructive imagination.

Amongst all gracious evidences of this ideal-ity thus far calendared, I think of few more noteworthy, of none more beautiful, than those to which we owe the first endowed lectureship of poetry in the United States; the second foundation strictly of its kind, if I mistake not, throughout the universities of the English-speaking world.

Whenever a university foundation is established for the study of elemental matters,—of scientific truth or human ideality,—we return to motives from which the antique and the medieval schools chiefly derived their impulse, if not their constitution. The founders would

restore a balance between the arbitrary and the fundamental mode of education. The resulting gain is not the overflow of collegiate resources, not the luxury of learning; not decoration, but enhanced construction. We have a fresh search after the inmost truth of things, the verities of which the Anglo-Florentine songstress was mindful when she averred that poets are your only truth-tellers; of which, also, Lowell, in his soliloquy of "Columbus," was profoundly conscious when he made the discoverer say:

For I believed the poets; it is they
Who utter wisdom from the central deep,
And, listening to the inner flow of things,
Speak to the age out of eternity.

Within these verities new estates originate; moreover, they perpetually advance the knowledge and methods of the time-honored professions. The present and future influences of a school are more assured when it enters their realm. If I did not believe this with my noon-day reason and common sense, it would be an imposture for me to discourse to you upon our theme. The sovereign of the arts is the imagination, by whose aid man makes every leap forward; and emotion is its twin, through which come all fine experiences, and all great deeds are achieved. Man, after all, is placed here to live his life. Youth demands its share in every study that can engender a power or a delight. Universities must enhance the use, the joy, the worth of existence. They are institutions both human and humane: not inevitable, except in so far as they become schools for man's advancement and for the conduct of life.

We now have to do with the most ideal and comprehensive of those arts which intensify life and suggest life's highest possibilities. The name of poetry, like that of gentleman, is "soiled with all ignoble use"; but that is because its

of students, faculty, and townspeople. These lectures were also delivered in the Berkeley Lyceum in New York during the following winter, in connection with Columbia College.

It seemed particularly appropriate that the magazine which had had the honor of first publishing Mr. Stedman's well-known works on the "Victorian Poets" and the "Poets of America" should introduce to the general public the present series of lectures. In preparing them for the press, the author has followed good precedent in retaining, instead of eliminating, the oral quality.—EDITOR OF THE CENTURY.

² Johns Hopkins University.

¹ The series of essays here begun formed the initial course, delivered in March, 1891, of the Percy Turnbull Memorial Lectureship of Poetry, founded at Johns Hopkins University by Mr. and Mrs. Lawrence Turnbull of Baltimore. The founders thus commemorate the name of their son Percy Graeme Turnbull, who died in 1887. In accordance with the terms of the gift, a course of lectures is to be delivered annually by some one who has gained distinction as a writer of poetry, or as a critical student of the poetic art.

Mr. Stedman purposely made this opening course of Turnbull lectures direct and elementary. They were delivered in Levering Hall, and were listened to with genuine and unusual interest by a crowded audience

province is universal, and its government a republic, whose right of franchise any one can exercise without distinction of age, sex, color, or (more 's the pity) of morals, brains, or birth-right. The more honor, then, to the founders of this lectureship, whose recognition of poetry at its highest is not disturbed by its abuse, and whose munificence erects for it a stately seat among its peers.

Under the present auspices, our own approach can scarcely be too sympathetic, yet none the less free of illusion and alert with a sense of realities. We may well be satisfied to seek for the mere ground-plot of this foundation. I am privileged, indeed, if I can suggest a tentative design for the substructure upon which others are to build and decorate throughout the future of your school. Poetry is not a science, yet a scientific comprehension of any art is possible and essential. Unless we come to certain terms at the outset, if only to facilitate this course, we shall not get on at all.

ENTER the studio of an approved sculptor, a man of genius, and, if you choose, poetic idealism. He is intent upon the model of a human figure, a statue to be costumed in garments that shall both conceal and express the human form. Plainly he has in his mind's eye the outside, the ultimate appearance, of his subject. He is not constructing a manikin, a curious bit of mechanism that imitates the interior—the bones, muscles, arteries, nerves—of the body. He is fashioning the man *as he appears to us*, giving his image the air, the expression, of life in action or repose. But you will perceive that even the rude joinery on which he casts his first clay is a structure suggesting a man's interior framework. Ere long the skeleton is built upon; the nude and very man is modeled roughly, yet complete, so that his anatomy shall give the truth, and not a lie, to the finished work. Not until this has been done will the sculptor superadd the drapery—the costume which, be it the symbol of our fall or of our advancement, distinguishes civilized man from the lower animals. At all events, it is a serious risk for the young artist to forego this progressive craftsmanship. Even a painter will rudely outline his figures according to primitive nature before giving them the clothing, which, however full of grace and meaning, is not *themselves*. Otherwise he will be a painter of dead garments, not of soul-possessing men and women. An artist of learning and experience may overleap this process, but only because his hand has become the trained slave of his creative vision, which sees clearly all that can lie beneath.

To the anatomic laws, then, of the human form the sculptor's and the figure-painter's

arts are subservient. The laws of every art are just as determinate, even those pertaining to the evasive, yet all-embracing art of poesy, whose spirit calls other arts to its aid and will imitate them, as art itself imitates nature; which has, in truth, its specific method and also the reflex of all other methods. I do not speak of the science, even of the art, of verse. Yet to know the spirit of poetry we must observe, with the temper of philosophers, its preëssentials in the concrete. Even its form and its method of work must be recognized as things of dignity: the material symbols and counterparts, as in Swedenborg's cosmos, of the spirit which is reality.

And thus, I say, we must obtain at least a serviceable definition of the word poetry for our present use. In beginning this course, it is well to let the mists rise, at least to have none of our own brewing. The sentimentalists invariably have befogged our topic. I ask you to divest your minds, for the moment, of sentimentalism, even of sentiment, and to assume, in Taine's phrase, that we are to begin by realizing "not an ode, but a law." Applied criticism—that which regards specific poets and poems—is a subsequent affair. Let us seek the generic elements that are to govern criticism by discovering and applying its standards. If you ask, To what end? I reply, That we may avoid dilettantism. We are not a group of working artists, but they possess something we can share; to wit, the sincere and even ascetic mood that wishes no illusions and demands a working basis. But again, to what purpose? Surely not for the development of a breed of poets! Consider the tenuous voices of minnesingers far and near, whose music rises like the chirping of locusts by noonday and of meadow-frogs at night. Each has his faultless little note, and while the seasonable chorus blends, it is humored by some and endured by most, quite as a matter of course, and the world goes on as usual. Human suffering may have been greater when the rhapsodist flourished and printing was unknown, when one was waylaid at the corners of the market-place, and there was no escape but in flight or assassination. And if our object were to train poets, and a past-master were on the rostrum, his teachings would be futile unless nature reassorted her averages. Fourier accounted for one poet in his phalanstery of a thousand souls; yet a shrewder estimate would allow but one memorable poet to a thousand phalansteries, in spite of the fact that even nature suspends her rules in countenance of youth's prerogative, and unfailingly supplies a laureate for every college class. With respect to training, the catalogues term a painter the pupil of Bonnat, of Duran, of Cabanel; a musician, pupil of Rubinstein or Liszt. But

the poet studies in his own atelier. He is not made, his poetry is not made, by *a priori* rules, any more than a language is made by the grammarians and philologists, whose true function is simply to report it. I assume, then, that the poet's technical modes, even the general structure of a masterwork, come by intuition, reading, experience; and that too studious consideration of them may perchance retard him. I suspect that no instinctive poet bothers himself about such matters in advance; he doubtless casts his work in the form and measures that come with its thought to him, though he afterward may pick up his dropped feet or syllables at pleasure. If he ponders on the Iambic Trimeter Catalectic, or any of its kin, his case is hopeless. In fact, I never have known a natural poet who did not compose by ear, as we say: and this is no bad test of spontaneity. And as for rules,—such, for example, as the Greeks laid down,—their efficacy is fairly hit off in that famous epigram of the Prince de Condé, when the Abbé d'Aubignac boasted that he closely observed the rules of Aristotle: "I do not quarrel with the Abbé d'Aubignac for having so closely followed the precepts of Aristotle; but I cannot pardon the precepts of Aristotle that occasioned the Abbé d'Aubignac to write so wretched a tragedy." We do see that persons of cleverness and taste learn to write agreeable verses; but the one receipt for making a poet is in the safe-keeping of nature and the foreordaining stars.

On the other hand, the mature poet, and no less the lover of poetry, may profitably observe what secrets of nature are applied to lyrical creation. The first Creator rested after his work, and saw that it was good. It is well for an artist to study the past, to learn what can be done and what cannot be done acceptably. A humble music-master can teach a genius not to waste his time in movements proved to be false. Much of what is good is established, but the range of the good is infinite; that which is bad is easily known. If there be a mute and to-be-glorious Milton here, so much the better. And for all of us, I should think, there can be no choicer quest, and none more refining, than, with the Muse before us, to seek the very well-spring and to discover the processes of her "wisdom married to immortal verse."

We owe to the artist's feeling that his gift is innate, and that it does produce "an illusion on the eye of the mind" which, he fears, too curious analysis may dispel: to this we doubtless owe his general reluctance to talk with definiteness concerning his art. Often you may as well ask a Turk after his family, or a Hindu priest concerning his inner shrine. I have put to several minstrels the direct question, "What is poetry?" without obtaining a

categorical reply. One of them, indeed, said, "I can't tell you just now, but if you need a first-class example of it, I'll refer you to my volume of 'Lyrics and Madrigals.'" But when they do give us chips from their workshop,—the table-talk of poets, the stray sentences in their letters,—these, like the studio-hints of masters, are both curt and precious, and emphatically refute Macaulay's statement that good poets are bad critics.

Even a layman shares the artist's hesitation to discourse upon that which pertains to human emotion. Because sensation and its causes are universal, the feeling that creates poetry for an expression, and the expression itself, in turn exciting feeling in the listener, are factors which we shrink from reducing to terms. An instinctive delicacy is founded in nature. To overcome it is like laying hands upon the sacred ark. One must be assured that this is done on the right occasion, and that, at least for the moment, he has a special dispensation. A false handling cheapens the value of an art—puts out of sight, with the banishment of its reserve, what it might be worth to us. All have access to the universal elements: they cost nothing, are at the public service, and even children and witlings can toy with and dabble in them. So it is with music, poetry, and other general expressions of feeling. Most people can sing a little, any boy can whistle—and latterly, I believe, any girl who would defy augury, and be in the fashion. Three fourths of the minor verse afloat in periodicals or issued in pretty volumes correspond to the poetry of high feeling and imagination somewhat as a boy's whistling to a ravishing cavatina on the Boehm flute. As a further instance, a knack of modeling comes by nature. If sculptor's clay were in every road-bank, and casts from the antique as common as school readers and printed books of the poets, we probably should have reputed Michelangelos and Canovas in every village instead of here and there a Ward, a St. Gaudens, or a Donoghue.

But it is precisely the arts in which anybody can dabble that the elect raise to heights of dignity and beauty. Those who realize this indulge a pardonable foible if they desire to reserve, like the Egyptian priests, certain mysteries, if only *pro magnifico*. Besides, there are periods when the utility of artistic analysis is not readily accepted by those who make opinion. Economics and sociology, for example, largely absorb the interest of one of our most scholarly journals. Its literary and art columns are ably conducted. The chief editor, however, told me that he knew little of esthetics, and cared to know less; and in such a way as to warrant an inference that, though well disposed, he looked upon art and song and poetry

very much as Black Bothwell regarded clerkly pursuits—that they were to him what Italian music seemed to Dr. Johnson, in whose honest eyes its practitioners were but fiddlers and dancing-masters. This undervaluation by a very clever man is partly caused, if not justified, one must believe, by the vulgarization of the arts of beauty and design. Yet these arts belong as much to the order of things, and indirectly make as much for wealth, as the science of economics, and they make as much for social happiness as the science of sociology—if, indeed, they are to be excluded from either.

Can we, even here, take up poetry as a botanist takes up a flower, and analyze its components? Can we make visible the ichor of its protoplasm, and recognize a something that imparts to it transcendency, the spirit of the poet within his uttered work? Why has the question before us been so difficult to answer? Simply because it relates to that which is at once inclusive and evasive. There is no doubt what sculpture and painting and music and architecture seem to be; the statements of critics may differ, but the work is visible and understood. Do you say with the philosophers that poetry is a sensation, that its quality lies in the mind of the recipient, and hence is indefinite? The assertion applies no less to the plastic arts and to music, yet the things by which those excite our sensations are well defined, and what I seek is the analogous definition of the spoken art. It has been said that "one element must forever elude researches, and that is the very element by which poetry is poetry." I confess we cannot define the specific perfume of a flower; but there is a logical probability that this conveys itself alike to all of us, that the race is as but one soul in receiving the impression. I believe we can seize upon all other conditions that make a flower a flower or a poem a poem.

Edgar Poe, catching an idea from Joubert, avowed his faith in the power of words to express all human ideas. Nor have I any doubt that for every clear thought, even for every emotion, words have been, or can be, found, as surely as there is a conquest of matter by the spirit; that speech, the soul's utterance, shares the subtleties of its master. Where it seems to fail, the fault is in the speaker. As a race goes on, both its conceptions and its emotions are clearer and richer, and language keeps pace with them. The time may come, indeed, when thought will not be "deeper than all speech," nor "feeling deeper than all thought." If we still lag in emotional expression, we can excite feelings similar to our own by the spells of art. I do not see why the primary elements of poetry in the concrete should not be stated without sophistication, and as

clearly as those of painting, music, or architecture. They have, in fact, been stated fragmentarily by one and another poet and thinker, most of whom agree on certain points. True criticism does not discredit old discovery in its quest for something more. Its office, as Mill says of philosophy, is not to set aside old definitions, but it "corrects and regulates them." It does not differ for the sake of novelty, but formulates what is, and shall be, of melody and thought and feeling, and what no less has been since first the morning stars sang together. I must ask you, then, to permit me, in this opening lecture, very swiftly to review familiar and historic utterances, from which we may combine principles eminently established, and, if need be, to add some newly stated factor, in our subsequent effort to formulate a definition of poetry that shall be scientifically clear and comprehensive, and also to establish limits beyond which speculation is foreign to the design of this lecture-course.

VARIOUS poets and thinkers, each after his kind, have contributed to such a definition. I have mentioned Aristotle. He at least applied to the subject a cool and level intellect, and his formula, to which in certain essentials all must pay respect, is an ultimate deduction from the antique. It fails of his master Plato's spirituality, but excels in precision. Aristotle regards poetry as a structure whose office is imitation through imagery, and its end delight—the latter caused not by the imitation, but through workmanship, harmony, and rhythm. The historian shows what has happened, the poet such things as might have been, devoted to universal truth rather than to particulars. The poet—the ποιητής—is, of course, a maker, and his task is invention. Finally, he must feel strongly what he writes. Here we have the classical view. The Greeks, looking upon poetry as a fine art, had no hesitation in giving it outline and law.

Naturally an artist like Horace assented to this conception. Within his range there is no more enduring poet, yet he excludes himself from the title, and this because of the very elements which make him so modern—his lyrical grace and personal note. With Aristotle, he yielded the laurel solely to heroic dramatists and epic bards. His example is followed by our brave old Chapman, Homer's bold translator, who declares that the *energia* of poets lies in "high and hearty Invention." Dryden also accepts the canon of Imitation, but avows that "Imaging is, in itself, the height and life of it," and cites Longinus, for whom poetry was "a discourse which, by a kind of enthusiasm, or extraordinary emotion of the soul, makes it seem to us that we behold those things which the poet paints." Landor, the

modern Greek, whose art was his religion, repeats that "all the imitative arts have delight for their principal object; the first of these is poetry; the highest of poetry is the tragic." But recognition of only the structure of verse, without its soul, deadened the poetry of France in her pseudo-classical period, from Boileau to Hugo, so that it could be declared, as late as A. D. 1838, that "in French literature that part is most poetry which is written in prose." Even the universal Goethe repressed his "noble rage" by the conception of poetry as an art alone, so that Heine, a pagan of the lyrical rather than of the inventive cast, said that this was the reason why Goethe's work did not, like the lesser but more human Schiller's, "beget deeds." "This is the curse," he declared, "of all that has originated in mere art." Like Pygmalion and the statue, "His kisses warmed her into life, but, so far as we know, she never bore children." Goethe's pupil, the young Matthew Arnold, accepted without reserve the antique notion of poetry. "Actions, human actions," he cried, are "the eternal objects of the muse." In after years, as we shall see, he formed a more sympathetic conception.

Other poets have thrown different and priceless alloys into the crucible from which is to flow the metal of our seeking, adding fire and sweetness to its tone. The chiefs of the romantic movement, so near our own time, believed Passion to be the one thing needful. Byron was its fervent exemplar. In certain moods, it is true, he affected to think that he and his compeers were upon a wrong system, and he extolled the genius and style of Pope. But this was after all had got the seed of his own flower. It was plainly an affectation of revolt from his own affectation, with haply some prophetic sense of naturalism as a basis for genuine emotion. His summing up is given in "Don Juan":

Thus to their extreme verge the passions brought
Dash into poetry, which is but passion,
Or at least was so, ere it grew a fashion.

Moore, light-weight as he was, aptly stated the Byronic creed: "Poetry ought only to be employed as an interpreter of feeling." This is certainly true, as far as it goes, and agrees with Mill's later but still limited canon, that poetry is emotion expressed in lyrical language. But a complete definition distinguishes the thing defined from everything else; it denotes, as you know, "the species, the whole species, and nothing but the species." Bascom and Ruskin follow Mill, but Ruskin adds other elements, saying that poetry is the suggestion, by the "imagination," of noble "thoughts" for noble emotions. This does not exclude painting and other emotional and imaginative arts. In truth, he is simply defining art, and takes poetry,

as Plato might, as a synonym for art in all its forms of expression.

An elevated view, on the whole, is gained by those who recognize more sensibly the force of Imagination. Here the twin contemplative seers, Wordsworth and Coleridge, lift their torches, dispersing many mists. They saw that poetry is not opposed to prose, of which verse is the true antithesis, but that in spirit and action it is the reverse of science or matter of fact. Imagination is its pole-star, its utterance the echo of man and nature. The poet has no restriction beyond the duty of giving pleasure. Nothing else stands between him and the very image of nature, from which a hundred barriers shut off the biographer and historian. Wordsworth admits the need of emotion, but renounces taste. Coleridge plainly has the instinct for beauty and the spell of measured words. The chief contributions of the Lake School to our definition are the recognition of the imagination and the antithesis of science to poetry. The pessimist Schopenhauer, who wrote like a musician on music, like a poet on poetry, yet with wholly impassive judgment, also avows that poetry is "the art of exciting by words the power of the imagination," and that it must "show by example what life and the world are."

From the attributes of invention, passion, and imagination may perhaps be deduced what seems to others the specific quality of the poet, the very quintessence of his gift. What should I mean, save that which Aristotle's master considered the element productive of all others and a direct endowment from heaven—the Inspiration governing creative, impassioned, imaginative art? The poet's soul was, according to Plato, in harmonic relation with the soul of the universe. It is true that in the "Republic" he supplies Aristotle with a technical basis; furthermore, as an idealist playing at government, he is more sternly utilitarian than even the man of affairs. The epic and dramatic makers of "imitative history" are falsifiers, dangerous for their divine power of exciting the passions and unsettling the minds of ordinary folk. He admires a poet, and would even crown him, but feels bound to escort him to the side of the ship Republic and to drop him overboard, as the Quaker repulsed the boarder, with the remark, "Friend, thee has no business here!" But this is Plato defying his natal goddess in a passing ascetic mood; Plato, in whose self the poet and philosopher were one indeed, having ever since been trying, like the two parts of his archetypal man, to find again so perfect a union. In his more general mood he atones for such wantonness, reiterating again and again that the poet is a seer, possessed of all secrets and guided by an inspiring spirit; that

without his second sight, his interpretation of the divine ideas symbolized by substance and action, his mission would be fruitless.

Those who take this higher view revere the name of Plato, though sometimes looking beyond him to the more eastern East, whence such occult wisdom is believed to flow—to such sayings as that ascribed to Zoroaster,¹ "Poets are standing transporters; their employment consists in speaking to the Father and to Matter, in provoking apparent copies of unapparent natures, and thus inscribing things unapparent in the apparent fabric of the world."

Cicero, deeply read in Plato, could not conceive of a poet's producing verse of grand import and perfect rhythm without some heavenly inbreathing of the mind. The soul's highest prerogative was to contemplate the order of celestial things and to reproduce it. Transcendental thinkers—such as Lord Bacon in his finest vein—recognize this as its office. While Bacon's general view of poetry is that all "Feigned History" (as he terms it), prose or verse, may be so classed, he says the use of it "hath been to give some shadow of satisfaction to the mind of man in those points wherein the nature of things doth deny it"; and again, that it is thought to "have some participation of divineness because it doth raise and erect the mind, by submitting the shews of things to the desires of the mind." Sidney's flawless "Apologie for Poetrie" exalts the prophetic gift of the vates above all art and invention. In our day Carlyle clung to the supremacy of inspiration, in art no less than in action. But no one since Plotinus has made it so veritably the golden dome of the temple as our seer of seers, Emerson, in whose belief the artist does not create so much as report. The soul works through him. "Poetry is the perpetual endeavor to express the spirit of the thing." And thus all the Concord group, notably Dr. Harris, in whose treatises of Dante and other poets the spiritual interpreting power of the bard is made preëminent. The subtlest modern poet of life and thought, Browning, has left us only one prose statement of his art, but that is the lion's progeny. The poet's effort he saw to be "a presentment of the correspondency of the universe to the Deity, of the natural to the spiritual, and of the actual to the ideal." Spiritual progress, rather than art, is the essential thing. A similarly extreme view led Carlyle (himself, like Plato, a poet throughout) to discountenance the making of poetry as an art. Carried too far, the Platonic idea often has vitiated the work of those minor transcendentalists who reduce their poetics to didactics, and inject the drop of prose that precipitates their rarest elixir. Their creed, however,—with its inclu-

sion of the bard as a revealer of the secret of things,—while not fully defining poetry, lays stress upon its highest attribute.

Thus we see that many have not cared to speak absolutely, and more have failed to discriminate between the thing done and the means of doing. Poetry is made a Brahma, at once the slayer and the slain. A vulgar delusion, that of poetasters, is to confound the art with its materials. The nobler error recognizes the poetic spirit, but not that spirit incarnate of its own will in particular and concrete form. The outcome is scarcely more exact and substantial than the pretty thesis caroled by "one of America's pet Marjories" in her tenth year, and long since become of record. This child's heart detected "poetry, poetry everywhere!" and proclaimed that:

You breathe it in the summer air,
You see it in the green wild woods,
It nestles in the first spring buds.

'T is poetry, poetry everywhere —
It nestles in the violets fair,
It peeps out in the first spring grass —
Things without poetry are very scarce.

That our naïve little rhymers were a sibyl, and her statement hardly more vague than the definitions of poetry offered by older philosophers, who will deny? All in all, various writers connected with the art movement of the present century have most sensibly discussed the topic. They recognize poetry as an entity, subject to expressed conditions. Hazlitt and Leigh Hunt logically distinguished between it and poetic feeling, and believed one to be the involuntary utterance of the other, sympathetically modulating the poet's voice to its key. Shelley, the Ariel of songsters, came right down to the ground of our enchanted isle, laying stress upon the dependence of the utterance on rhythm and order—on "those arrangements of language, and especially metrical language, which are created by that imperial faculty whose throne is contained within the invisible nature of man." More recently the poet-critic Watts, in the best modern essay upon the subject, says that "absolute poetry is the concrete and artistic expression of the human mind in emotional and rhythmical language." Here we certainly are getting out of the mists. In these formulas an effort for precision is apparent, and the latest one would be satisfactory did it insist more definitely, within itself, upon the office of the imagination, and upon the interpretative gift which is the very soul of our art.

The ideas presented by many of the poets seem in the main conformed to their own respective gifts, and therefore in a sense limited.

¹ Cited by F. B. Sanborn in a paper on Emerson.

Thus, years after Schlegel had termed poetry "the power of creating what is beautiful, and representing it to the eye or ear," our disciple of taste, Poe, who avowed that poetry had been to him "not a purpose, but a passion," amended Schlegel's terms with the adjective needed to complete his own definition—"the *Rhythmical* Creation of Beauty." Never did a wayward romancer speak with a sincerer honesty of the lyrical art, and he clenched his statement by adding that its sole arbiter was Taste. If you accept beauty in a comprehensive sense, including all emotions, truths, and ethics, accept this definition as precise and unflinching. But Poe confines its meaning to the domain of esthetics, which of itself he thought opposed to vice on account of her deformity; furthermore, he restricts it to what he terms supernal beauty, the note of sadness and regret. This was simply his own highest range and emotion. His formula, however, will always be tenderly regarded by refined souls, for Beauty, pure and simple, is the alma mater of the artist; her unswerving devotee is absolved—many sins are forgiven to him who has loved her much.

But often a poet, great or small, has burnished some facet of the jewel we are setting. Milton's declaration that poetry is "simple, sensuous, passionate," is a recognition of its most effective attributes.¹ Lowell has sprinkled the whole subject with diamond-dust, and he, of all, perhaps could best have given a new report of its tricky spirit. Arnold's phrase, "a criticism of life, under the conditions fixed for such a criticism by the laws of poetic truth and poetic beauty," is of value, yet one of those definitions which themselves need a good deal of defining. With the exception of Mr. Watts, we see that not even the writers of our logical period have condensed into a single clause a statement that establishes, practically and inclusively, the basis on which our art sustains its enrapturing vitality, and Mr. Watts's statement leaves something for inference and his after-explanation. Before endeavoring, in the next lecture, to construct a framework that may serve our temporary needs, I wish to consider briefly the most suggestive addition which this century has made to the elements previously observed. I refer to the assertion of Wordsworth and Coleridge that poetry is "the antithesis of science."

¹ Milton's phrase has become familiar as a proverb since Coleridge used it with great force in the prelude to his lectures on Shakspeare and on the Drama, but it is seldom quoted with its context, as found in the tractate "On Education," addressed to Samuel Hartlib, A. D. 1644. The poet there speaks of "Rhetoric" as an art to which poetry would be made subsequent, or indeed rather precedent, as being less subtle and fine, but more simple, sensuous, and passionate. I mean not here the

WHAT does this assertion mean, and how far does its bearing extend? The poet has two functions, one directly opposed to that of the scientist, and avoided by him, while of the other the scientist is not always master. The first is that of treating nature and life as they *seem*, rather than as they are; of depicting phenomena, which often are not actualities. I refer to physical actualities, of which the investigator gives the scientific *facts*, the poet the *semblances* known to eye, ear, and touch. The poet's other function is the exercise of an insight which pierces to spiritual actualities, to the meaning of phenomena, and to the relations of all this scientific knowledge.

To illustrate the distinction between a poet's, or other artist's, old-style treatment of things as they seem and the philosopher's statement of them as they are, I once used an extreme, and therefore a serviceable, example; to wit, the grand Aurora fresco in the Rospigliosi palace. Here you have the childlike, artistic, and phenomenal conception of the antique poets. To them the Dawn was a joyous heroic goddess, speeding her chariot in advance of the sun-god along the clouds, with the beauteous Hours lackeying her scattered many-hued blossoms down the eastern sky. For the educated modern there is neither Aurora nor Apollo; there are no winged Hours, no flowers of diverse hues. His sun is an incandescent material sphere, alive with magnetic forces, engirt with hydrogenous flame, and made up of constituents more or less recognizable through spectrum analysis. The colors of the auroral dawn—for the poet still fondly calls it auroral—are rays from this measurable incandescence, refracted by the atmosphere and clouds, under the known conditions that have likewise put to test both the pagan and biblical legends of that prismatic nothing, the rainbow itself. The stately blank-verse poem, "Orion," which the late Hengist Horne published at a farthing half a century ago, is doubtless our most imaginative rendering of the legend which placed the blind giant in the skies. The most superb of constellations represents even in modern poetry a mythical demigod. In science it was but the other day that the awful whirl of nebulae developed by the Lick telescope revealed it to us almost as a distinct universe in itself.

But to show the distinction as directly af-

prosody of a verse, which they could not but have hit on before among the rudiments of grammar; but that sublime art which in Aristotle's poetics, in Horace, . . . teaches what the laws are of a true epic poem, what of a dramatic, what of a lyric, what decorum is, which is the grand masterpiece to observe. This would make them soon perceive what despicable creatures our common rhymers and playwrights be; and show them what religious, what glorious and magnificent, use might be made of poetry, both in divine and human things.

fecting modes of expression, take the first of countless illustrations that come to hand; for instance, the methods applied to the treatment of one of our recurrent coast storms. The poet says:

When descends on the Atlantic
The gigantic
Storm-wind of the Equinox,
Landward in his wrath he scourges
The toiling surges
Laden with sea-weed from the rocks.

Or take this stanza by a later balladist:

The East Wind gathered, all unknown,
A thick sea-cloud his course before:
He left by night the frozen zone,
And smote the cliffs of Labrador;
He lashed the coasts on either hand,
And betwixt the Cape and Newfoundland
Into the bay his armies pour.

All this impersonation and fancy is translated by the Weather Bureau into something like the following:

An area of extreme low pressure is rapidly moving up the Atlantic coast, with wind and rain. Storm-center now off Charleston, S. C. Wind N.E. Velocity, 54. Barometer, 29.6. The disturbance will reach New York on Wednesday, and proceed eastward to the Banks and Bay St. Lawrence. Danger-signals ordered for all North Atlantic ports.

We cannot too clearly understand the difference between artistic vision and scientific analysis. The poet in his language and the painter with his brush are insensibly and rightly affected by the latter. The draughtsman, it is plain, must depict nature and life as they seem to the eye, and he needs only a flat surface. The camera has proved this, demonstrating the fidelity in outline and shadow of drawings antedating its use. The infant, the blind man suddenly given sight, see things in the flat as we do, but without our acquired sense of facts indicated by their perspective. We have learned, and experience has trained our senses to instant perception, that things have the third dimension, that of thickness, and are not equally near or far. The Japanese, with an instinct beyond that of some of his Mongolian neighbors, avoids an extreme flat treatment by confining himself largely to the essential lines of objects, allowing one's imagination to supply the rest. He carries suggestiveness, the poet's and the artist's effective ally, to the utmost. Still, as Mr. Wores says, he has no scruples about facts, "for he does not pretend to draw things as they are, or should be, but as they seem." Now, it is probable that the Aryan artist is born with a more analytic vision than that of the Orient;

if not, that he does instinctively resist certain inclinations to draw lines just as they appear to him. But this natural resistance unquestionably was long ago reinforced by his study of the laws of perspective. The generally truer and more effective rendering of outline and shadow by Western masters cannot be denied, and furnishes an example of the aid which scientific analysis can render to the artist. In just the same way, we may see, empirical knowledge is steadily becoming a part of the poet's equipment, and, I have no doubt, is by inherited transmission giving him at birth an ability to receive from phenomena more scientifically correct impressions. For his purposes, nevertheless, the portrayal of things as they seem conveys a truth just as important as that other truth which the man of analysis and demonstration imparts to the intellect. It is the *methods* that are antithetical.

The poet's other function, which the scientist does not avoid, but which research alone does not confer upon him, is that of seizing the abstract truth of things whether observed or discovered. It has been given out, though I do not vouch for it, that Edison obtains some of his ideas for practical invention from the airy flights of imagination taken by writers of fiction. In any case, it is clear that with respect to inventive surmise, the poet is in advance: the investigator, if he would leap to greater discoveries, must have the poetic insight and imagination—be, in a sense, a poet himself, and exchange the mask and gloves of the alchemist for the soothsayer's wand and mantle. Those of our geologists, biologists, mechanicians, who are not thus poets in spite of themselves must sit below the seers who by intuition strike the trail of new discovery. For beyond both the phantasmal look of things and full scientific attainment there is a universal coherence—there are infinite meanings—which the poet has the gift to see, and by the revelation and prophecy of which he illumines whatever is cognizable.

The so-called conflict of science and religion, in reality one of fact and dogma, has been waged obviously since the time of Galileo. Its annals are recorded. It was the sooner inevitable because science takes nothing on faith. The slower, but equally prognosticable, effect of exact science on poetry, though foreseen by the Lake School, was not extreme until recently—so recently, in fact, that a chapter which I devoted to it in 1874 was almost the first extended consideration that it received. Since then it has been constantly debated, and not always radically. That the poets went on so long in the old way, very much like the people who came after the deluge, was due to two conditions. First, their method was so ingrained in

literature, so common to the educated world, that it sustained a beauteous phantasmagory against all odds. Again, the poets have walked in lowly ways, and each by himself; they have no proud temporal league and station, like the churchmen's, to make them timid of innovation, of any new force that may shake their roof-trees. They have been gipsies, owning nothing, yet possessed of everything without the care of it. At last they see this usufruct denied them; they are bidden to surrender even their myths and fallacies and inspiring illusions. With a grace that might earlier have been displayed by the theologians, they are striving to adapt art to its conditions, though at the best it is a slow process to bring their clientage to the new ideality. Though the imagery and diction which have served their use, and are now absurd, must cease, the creation of something truer and nobler is not the work of a day, and of a leader, but of generations. So there is a present struggle, and the poets are sharing the discomfort of the dogmatists. The forced marches of knowledge in this age do insensibly perturb them, even give the world a distaste for a product which, it fears, we must distrust. The new learning is so radiant, so novel, and therefore seemingly remarkable, that of itself it satiates the world's imagination. Even the abashed idealists, though inspired by it, feel it becoming to fall into the background. Some of them recognize it with stoical cynicism and stern effect. In Balzac's "The Search for the Absolute," Balthazar's wife, suffering agonies, makes an attempt to dissuade him from utterly sacrificing his fortune, his good name, even herself, in the effort to manufacture diamonds. He tenderly grasps her in his arms, and her beautiful eyes are filled with tears. The infatuated chemist, wandering at once, exclaims: "Tears! I have decomposed them: they contain a little phosphate of lime, chloride of sodium, mucin, and water." Such is the last infirmity of noble minds to-day.

We latterly find our bards alive to scientific revelations. It has been well said that a "Paradise Lost" could not be written in this century, even by a Milton. In his time the Copernican system was acknowledged, but the old theory of the universe haunted literature and was serviceable for that conception of "man's first disobedience," and the array of infernal and celestial hosts, to which the great epic was devoted. In our own time such a poet as Tennyson, to whom the facts of nature are everything, does not make a lover say, "O god of day!" but

Move eastward, happy earth, and leave
Yon orange sunset, waning slow.

Browning, De Banville, Whitman, Emerson earliest and most serenely,—in fact, all modern

intellectual poets,—not only adapt their works to physical knowledge, but, as I say, often forestall it. Even as we find them turned savants, we find our Clerk Maxwells, Roods, Lodges, Rowlands, poets in their quick guesses and assumptions. Imaginative genius is such that often one of its electric flames will come through what is ordinarily a non-conductor. That term, howbeit, cannot be applied to an American scientist¹ who enjoys the distinction of being at once a master of abstruse mathematics and a brilliant writer of very poetic novels, and to whom I put the same question I have addressed to poets—simply, What is poetry? He repaid me with a letter setting forth in aptest phrase his own belief in the kindred imaginations of the physicist and the poet. Naturally he considers the physical discoverer just now more triumphant and essential. "His study," he says, "is relations. When he cannot discover them, he invents them—strings his fact-beads on the thread of hypothesis." After some illustrations of this, he sets present research above past fancy, and exclaims: "Compare the wings of light on which we ascend with a speed to girdle the earth eight times a second, to sift the constitution of stars, with the steed of Mohammed and its five-league steps and eyes of jacinth! What a chapter the Oriental poet could give us to-day in a last edition of Job—founding the conception of the Unknown on what we *know* of his works, instead of on our ignorance of them. I want a new Paul to rewrite and restate the doctrine of immortality."

But here the poet may justly break in and say, It is not from investigators, but from the divine preachers, that we inherit this doctrine of immortality. Being poets, through insight they saw it to be true, and announced it as revealed to them. Let science demonstrate it, as it yet may, and the idealists will soon adjust their imagery and diction to the resulting conditions. It is only thus they *can* give satisfaction and hold their ground. The prolongation of worn-out fancy has been somewhat their own fault, and it is just they should suffer for it. Still, although we may shift externals, the idealists will be potent as ever; their strength lies not in their method, but in their sovereign perception of the relations of things. Even the theologians no longer dismiss facts with the quotation, "Canst thou by searching find out God?" The world has learned that at all events we can steadily broaden and heighten our conception of him. We are beginning to verify Lowell's prophetic statement:

Science was faith once; Faith were science now
Would she but lay her bow and arrows by
And arm her with the weapons of the time.

¹ Prof. A. S. Hardy of Dartmouth.

Theology, teaching immortality, now finds science deducing the progressive existence of the soul as an inference from the law of evolution. Poetry finds science offering it fresh discovery as the terrace from which to essay new flights. While realizing this aid, a temporary disenchantment is observed. The public imagination is so intent upon the marvels of force, life, psychology, that it concerns itself less with the poet's ideals. Who cares for the ode pronounced at the entrance of this Exposition, while impatient to reach the exhibits within the grounds? Besides, fields of industrial achievement are opened by each investigation, enhancing human welfare, and absorbing our energies. The soldiers of this noble war do not meditate and idealize; their prayer and song are an impulse, not an occupation.

My romancer and scientist goes on to say, "In all this the poet loses nothing. It is fundamental fact that the conquest of mystery leads to greater mystery; the more we know the greater the material for the imagination." This I too believe, and that the poet's province is, and ever must be, the expression of the manner in which revealed truths, and truths as yet unseen but guessed and felt by him, affect the emotions and thus sway man's soul.

Therefore his final ground is still his own, and he well may say, as Whitman chanted thirty years ago:—

Space and Time! now I see it is true, what I guessed at.

I accept Reality, and dare not question it,
Materialism first and last imbuing.

Gentlemen, to you the first honors always!
Your facts are useful, and yet they are not my dwelling,

I but enter by them to an area of my dwelling.
Less the reminders of properties told my words,
And more the reminders they of life untold.

Insight and spiritual feeling will continue to precede discovery and sensation. In their footprints the investigator must advance for his next truth, and at the moment of his advance become one with the poet. In the words of Tyndall on Emerson, "Poetry, with the joy of a bacchanal, takes her grave brother by the hand, and cheers him with immortal laughter." Meanwhile the laws of change, fashion, ennui, that breed devotion first to one exercise of man's higher faculty, and anon to another, will direct the public attention alternately to the investigator and to the poet. In lulls or fatigue of discovery, there will be an eager return to the oracles for their interpretation of the omens of the laboratory and ward. The services of the temple are confined no more to the homily and narrative than to song and prayer.

Edmund Clarence Stedman.

OUR TOLSTOI CLUB.

I SHOULD be glad to tell a story if I only knew one, but I don't. Some people say that one experience is as interesting as another, and that any real life is worth hearing about; but I think it must make some little difference who the person is. But if I really must tell one, and since you all have told yours, and such nice ones, and anything is better than nothing when we are kept in all the morning by a pouring rain, with nothing to do, because we came only for a week and did not expect it

to rain, I will try and tell you about our Tolstoi Club, because that was rather like a story—at least it might have been like one if things had turned out a little differently.

You know I live in a suburb of Boston, and a very charming, delightful one it is. I cannot call it by its real name, because I am going to be so very personal; so I will call it "Baby-

land," which indeed people often do in fun. There never was such a place for children. The population is mostly under seven years old, for it was about seven years ago that young married people began to move into it in such numbers, because it is so healthy; but it was always a great place for them even when it was small. The old inhabitants are mostly grandfathers and grandmothers now, and enjoy it very much; but they usually go into town in the winter, with such unmarried children as they have left, to get a little change; for there is no denying that there is a sameness about it—the sidewalks are crowded with perambulators every pleasant day, and at our parties the talk is apt to run too much on nursery-maids, and milkmen and their cows, and drains, to be very interesting to those who have not learned how terribly important such things are. So in winter we—I mean the young married couples, of whom I am half a one—are left pretty much to our own devices.

Though we are all so devoted to our infant families, we are not so much so as to give up

all rational pleasures or intellectual tastes; we could not live so near Boston, you know, and do that. Our husbands go into town every day to make money, and we go in every few days to spend it, and in the evenings, if they are not too tired, we sometimes make them take us in to the theaters and concerts. We all have a very nice social circle, for Babyland is fashionable as well as respectable, and we are asked out more or less, and go out; but for real enjoyment we like our own clubs and classes the best. We feel so safe going round in the neighborhood, because we are so near the children, and can be called home any time if necessary. There is our little evening dancing-club, which meets round at one another's houses, where we all exchange husbands—a kind of grown-up "puss-in-the-corner"; only, as the supply of dancing husbands is not quite equal to that of wives, we have to get a young man or two in if we can; and for the same reason we don't ask any girls, who, indeed, are not very eager to come. Then there is the musical club, and the sketching-club, and we have a great many morning clubs for the women alone, where we bring our work (and it is splendid to get so much time to sew), and read or are read to, and then talk over things. Sometimes we stay to lunch, and sometimes not; and we would have an essay club, only we have no time to write the papers.

Now, many of these clubs meet chiefly at Minnie Mason's—Mrs. Sydney Mason's. She gets them up, and is president: you see, she has more time, because she has no children—the only woman in Babyland who has n't, and I don't doubt she feels dreadfully about it. She was not strong, and had to lie on the sofa most of the time, and that was another reason why we met there so often; and then she lives right in the midst of us all, and so close to the road that we can all of us watch our children, when they are out for their airings, very conveniently. Minnie is very kind and sympathetic, and takes such an interest in all our affairs, and if she is somewhat inclined to gossip about them, poor dear, it is very natural, when she has so few of her own to think about.

Well, in the autumn before last, Minnie said we must get up a Tolstoi Club; she said the Russians were the coming race, and Tolstoi was their greatest writer, and the most Christian of moralists (at least, she had read so), and that everybody was talking about him, and we should be behindhand if we could not. So we turned one of our clubs, which had nothing particular on hand just then, into one; and, besides Tolstoi, we read other Russian novelists, Turgenieff and—that man whose name is so hard to pronounce, who writes all about convicts and—and other criminals. We did not read

them all, for they are very long, and we can never get through anything long; but we hired a very nice lady "skimmer," who ran through them, and told us the plots, and all about the authors, and read us bits. I forget a good deal, but I remember she said that Tolstoi was the supreme realist, and that all previous novelists were romancers and idealists, and that he drew life just as it was, and nobody else had ever done anything like it, except indeed the other Russians; and then we discussed. In discussion we are very apt to stray off to other topics, but that day I remember Bessie Milliken saying that the Russians seemed very queer people; she supposed that if every one said these authors were so true to life, they must be, but she had never known such an extraordinary state of things. Just as soon as ever people were married,—if they married at all,—they seemed wild to make love to some one else, or have some one else make love to them.

"They don't seem to do so here," said Fanny Deane.

"We certainly do not," said Blanche Livermore. "I think the reason must be that we have no time. I have scarcely time to see anything of my own husband, much less to fall in love with any one else's."

We all laughed, but we felt that it was odd. In Babyland all went on in an orderly and respectable fashion. The gayest girls, the fastest young men, as soon as they were married and settled there, subsided at once into quiet, domestic ways. At our dances each of us secretly thought her own husband the most interesting person present, and he returned the compliment, and after a peaceful evening of passing them about we were always very thankful to get them back to go home with. Were we, then, so unlike the rest of humanity?

"Are we sure?" asked Minnie Mason, always prone to speculation. "It is not likely that we are utterly different from the rest of the world. Who knows what dark tragedies lie hidden in the recesses of the heart? Who knows all her neighbor's secret history?" This was being rather personal, but no one took it home, for we never minded what Minnie said; and as many of the club were, as always occurred, detained at home by domestic duties, we thought it might apply to one of them. But I can't deny that we, and especially Minnie, who had a relish for what was sensational, and was pleased to find that realistic fiction, which she had always thought must be dull, was really exciting, felt a little ashamed at our being so behind the age—"provincial," as Mr. James would call it; "obsolete," as Mr. Howells is fond of saying—at Babyland as not to have the ghost of a scandal among us. None of us wished to give cause for the scandal ourselves; but I

think we might not have been as sorry as we ought to be if one of our neighbors had been obliging enough to do so. We did not want anything very bad, you know. Of course none of us could ever have dreamed of running away with a fascinating young man,—like Anna Karenina,—because in the first place we all liked our husbands, and in the next place, who could be depended upon to go into town to do the marketing, and to see that the children wore their india-rubbers on wet days? But anything short of that we felt we could bear with equanimity.

That same fall we were excited, though only in our usual harmless, innocent way, by hearing that the old Grahame house was sold, and pleased — though no more than was proper — that it was sold to the Williamses. It was a pretty, old farm-house which had been improved upon and enlarged, and had for many years been to let; and being as inconvenient as it was pretty, it was always changing its tenants, whom we despised as transients, and seldom called upon. But now it was bought, and by none of your new people, who, we began to think, were getting too common in Babyland. We all knew Willie Williams: all the men were his old friends, and all the women had danced with him, and liked him, and flirted with him; but I don't think it ever went deeper, for somehow all the girls had a way of laughing at him, though he was a handsome fellow, and had plenty of money, and was very well behaved, and clever too in his way; but we could not help thinking him silly. For one thing, he would be an artist, though you never saw such dreadful daubs as all his pictures were. It was a mercy he did not have to live by them, for he never sold any; he gave them away to his friends, and Blanche Livermore said that was why he had so many friends, for of course he could not work off more than one apiece on them. He was very popular with all the other artists, for he was the kindest-hearted creature, and always helped those who were poor, and admired those who were great; and they never had anything to say against him, though they could not get out anything more in his praise than that he was "careful and conscientious in his work," which was very likely true. Then he was vain; at least he liked his own good looks, and, being esthetic in his tastes, chose to display them to advantage by his attire. He wore his hair, which was very light, long, and was seldom seen in anything less fanciful than a boating-suit, or a bicycle-suit, though he was not given to either exercise, but wanted an excuse for a blouse, and knee-breeches, and tights, and a soft hat — and these were all of a more startling pattern than other people's; while as to the velvet painting-jackets, and brocade dressing-

gowns, in which he indulged in his studio, I can only say that they made him a far more picturesque figure than any in his pictures. It was a shame to waste such materials on a man. Then he lisped when he was at all excited, which he often was; and he had odd ways of walking, and standing, and sitting, which looked affected, though I really don't think they were.

He made enthusiastic but very brief love to all of us in turn. I don't know whether any of us could have had him; if one could, all could; but supposing we could, I don't believe any of us would have had the courage to venture on Willie Williams. But we expected that his marriage would be romantic and exciting, and his wedding something out of the common. Opinions were divided as to whether his ardent love-making would induce some lovely young Italian or Spanish girl of rank to run away from a convent with him, or whether he would rashly take up with some artist's model, or goose-girl, or beggar-maid. We were much disappointed when, after all, he married in the most commonplace manner a very ordinary girl named Loulie Latham.

We all knew Loulie too; she went to school at Miss Woodbury's, in the class next below mine; and she was a nice girl, and we all liked her well enough, but there never was a girl who had less in her. She was not bad-looking, but no beauty; not at all the kind of looks to attract an artist. Blanche Livermore said that he might have married her for her red hair if only there had been more of it. The Lathams were very well connected, and knew everybody, and she went about with the other girls, and had a fair show of attention at parties; but she never had friends or lovers. She had not much chance to have any, indeed, for she married very young.

She was a very shy, quiet girl, and I used to think that perhaps it was because she was so overcrowded by her mother. Mrs. Latham was a large, striking-looking if not exactly handsome, lady-like though loud, woman, who talked a great deal about everything. She was clever, but eccentric, and took up all manner of fads and fancies, and though she was a thoroughly good woman, and well born and well bred, she did know the very queerest people — always hand in glove with some new crank. Hygiene, as she called it, was her pet hobby. Fortunately she had a particular aversion to dosing; but she dieted her daughter and herself, which, I fear, was nearly as bad. All her bread had husks in it, and she was always discovering that it was hurtful to eat any butter or drink any water, and no end of such notions. She dressed poor Loulie so frightfully that it was enough to take all the courage out of a girl: with all

her dresses very short in the skirt, and big at the waist, and cut high, even in the evening, and thick shoes very queerly shaped, made after her own orders by some shoemaker of her own, and loose cotton gloves, and a mushroom hat down over her eyes. Finally she took up the mind-cure, and Loulie was to keep thinking all the time how perfectly well she was, which, I think, was what made her so thin and pale. Mrs. Latham always said that no one ever need be ill, and indeed she never was herself, for she was found dead in her bed one morning without any warning.

This happened at Jackson, New Hampshire, where they were spending the summer. Of course poor Loulie was half distracted with the shock and the grief. There was no one in the house where they were whom she knew at all, or who was very congenial, I fancy, and Willie Williams, whom they knew slightly, was in the neighborhood, sketching, and was very kind and attentive, and more helpful than any one would ever have imagined he could be. He saw to all the business, and telegraphed for some cousin or other, and made the funeral arrangements; and the end of it was that in three months he and Loulie Latham were married, and had sailed for Europe on their wedding tour.

This was ten years ago, and they had never come back till now. They meant to come back sooner, but one thing after another prevented. They had no children for several years, and they thought it a good chance to poke round in the wildest parts of southern Europe,—Corsica, and Sardinia, and the Balearic Isles, and all that,—and made their winter quarters at Palermo. Then for the next six years they lived in less out-of-the-way places. They had four children, and lost two; and one thing or another kept them abroad, until they suddenly made up their minds to come home.

We had not heard much of them while they were gone. Loulie had no one to correspond with, and Willie, like most men, never wrote letters; but we all were very curious to see them, and willing to welcome them, though we did not know how much they were going to surprise us. Willie Williams, indeed, was just the same as ever—in fact, our only surprise in him was to see him look no older than when he went away; but as for Mrs. Williams, she gave us quite a shock. For my part, I shall never forget how taken aback I was, when, strolling down to the station one afternoon with the children, with a vague idea of meeting Tom, who might come on that train, but who did n't, I came suddenly upon a tall, splendidly shaped, stately creature, in the most magnificent clothes; at least they looked so, though they were all black, and the dress was only cashmere, but it was

draped in an entirely new way. She wore a shoulder-cape embroidered in jet, and a large black hat and feather set back over great masses of rich dark auburn hair; and though so late in the season, she carried a large black lace parasol. To be sure, it was still very warm and pleasant. I never should have ventured to speak to her, but she stopped at once, and said, "Perhaps you have forgotten me, Mrs. White?"

"No—oh, no," I said, trying not to seem confused; "Mrs.—Mrs. Williams, I believe?"

"You knew me better as Loulie Latham," she said, pleasantly enough; but I cannot say I liked her manner. There was something in it, though I could not say what, that seemed like condescension, and she hardly mentioned my children,—and most people think them so pretty,—though I saw her look at them earnestly once or twice.

Willie was the same good-hearted, hospitable fellow as ever, and begged us to come in, and go all over his house, and see his studio that he had built on, and his bric-à-brac. And a lovely house it was, full of beautiful things, for he knew them, if he could not paint them, and indeed he had a great talent for amateur carpentering. We wished he would come to our houses and do little jobs to show his goodwill, instead of giving us his pictures; but we tried to say something nice about them, and the frames were most elegant. Of course we saw a good deal of Mrs. Williams, but I don't think any of us took to her. She was very quiet, as she always had been, but with a difference. She was perfectly polite, and I can't say she gave herself airs, exactly; but there was something very like it in her seeming to be so well satisfied with herself and her position, and caring so little whether she pleased us or not. Of course we all invited them, and they accepted most of our invitations when they were asked together, though she showed no great eagerness to do so; but she would not join one of our morning clubs, and had no reason to give. It could not be want of time, for we used to see her dawdling about with her children all the morning, though we knew that she had brought over an excellent, highly trained, Protestant North German nurse for them. When we asked her to the dancing-class, she said she never danced, and we had better not depend on her, but Mr. Williams enjoyed it, and would be glad to come without her. We did not relish this indifference, though it gave us an extra man, and Minnie Mason said that it was not a good thing for a man to get into the way of going about without his wife.

"Why not?" said Mrs. Williams, opening her great eyes with such an air of utter ignorance that it was impossible to explain. It was easy to see that she need not be afraid of trust-

ing her husband out of her sight, for a more devoted and admiring one I never saw, whether with her, or away from her, talking of "Lou-lou" and her charms, as if sure of sympathy. But we had our doubts as to how much she returned his attachment, and Minnie said it was easy to see that she only tolerated him; and we all thought her unappreciative, to say the least. He was very much interested in her dress, and spent a great deal of time in choosing and buying beautiful ornaments and laces and stuffs for her, which she insisted on having made up in her own way, languidly remarking that it was enough for Willie to make her a fright on canvas, without doing so in real life. Blanche Livermore said she must have some affection for him, to sit so much to him, for he had painted about a hundred pictures of her in different styles, each one worse than the last. You would have thought her hideous if you had only seen them; but Willie's artist friends, some of them very distinguished, had painted her too, and made her into a regular beauty. Opinions differed about her looks; but those who liked her the least had to allow that she was fine-looking, though some said it was greatly owing to her style of dress. We all called it shockingly conspicuous at first, and then went home and tried to make our things look as much like hers as we possibly could, which was very little; for, as we afterward found out, they came from a modiste at Paris who worked only for one or two private customers, and whose costumes had a kind of combination of the fashionable and the artistic which it seemed impossible for any one here to hit. We used to wonder how poor Mrs. Latham would feel, could she rise from her grave, to behold her daughter's gowns, tight as a glove, and in the evening low and long to a degree, her high-heeled French shoes, and everything her mother had thought most sinful. Her hair had grown a deeper, richer shade abroad, and she had matched it to perfection, and one of Willie's pictures of her, with the real and false all down her back together, looked like the burning bush. She was in slight mourning for an old great-uncle who had left her a nice little sum of money; and we thought, if she were so inimitable now, what would she be when she put on colors?

We did better in modeling our children's clothes after hers, and I must say she was very good-natured about lending us her patterns. She had a boy and girl, beautiful little creatures, but they looked rather delicate, which she did not seem to realize at all; she was very amiable in her ways to them, but cool, just as she was to their father.

It must be confessed that we spent a great deal of time at our clubs in discussing her, especially at the Tolstoi Club; for, as Minnie

remarked, she seemed very much in the Russian style, and it was not disagreeable, after all, to think that we might have such a "type," as they call it, among us.

Just as we had begun to get accustomed to Mrs. Williams's dresses, and her beauty, and her nonchalance, and held up our heads again, she knocked us all over with another ten-strike. It was after a little dinner given for them at the Millikens', and a good many people had dropped in afterward, as they were apt to do after our little dinners, to which of course we could not ask all our set, however intimate. Mrs. Reynolds had come out from Boston, and as she was by way of being very musical, though she never performed, she eagerly asked Willie Williams, when he mentioned having lived so long in Sicily, whether he had ever seen Giudotti, the great composer, who had retired to the seclusion of his native island in disgust with the world, which he thought was going, musically speaking, to ruin. We listened respectfully, for most of us did not remember hearing of the great Giudotti, but Willie replied coolly:

"Oh, yes; we met him often; he was my wife's teacher. Loulou, I wish you did sing that little thing of Mickiewicz, '*Panicz i Dziewczyna*,' which Giudotti set for you."

Loulie was leaning back on a sofa across the room, lazily swaying her big black lace fan. She had on a lovely gown of real black Spanish lace, and a great bunch of yellow roses on her bosom, which you would not have thought would have looked well with her red hair; but they suited her "Venetian coloring," as her husband called it—

"Ni blanche ni cuivrée, mais dorée
D'un rayon de soleil."

Willie's strong point, or his weak point, as you may consider it, was in quotations. She did not seem any too well pleased with the request, and replied that she hardly thought people would care to hear any music; it seemed a pity to stop the conversation—for all but herself were chattering as fast as they could. But of course we all caught at the idea, and the hostess was pressing, and after every mortal in the room had entreated her, she rose, still reluctantly, and walked across the room to the piano, saying that she hoped they really would not mind the interruption.

It sounded fine to have something specially composed for her, but we were accustomed to hear Fanny Deane, the most musical one among us, sing things set for her by her teacher—in-deed, rather more than we could have wished; and I thought now to hear something of the same sort—some weak little melody all on a few notes, in a muffled little voice, with a word

or two, such as "weinend," or "veilchen," or "frühling," or "stella," or "bella," distinguishable here and there, accordingly as she sang in German or Italian. So you may imagine how I, as well as all the rest, was struck when, without a single note of prelude, her deep, low voice thrilled through the whole room:

"Why so late in the wood,
Fair maid?"

I never felt so lonely and eery in my life; and then in a moment the wildly ringing music of the distant chase came, faint but growing nearer all the time, from the piano, while her voice rose sweeter and sadder above it, till our pleasure grew more delicious as it almost melted into pain. The adventures of the fair maid in the wood were, to say the least, of a very compromising description; but we flattered ourselves that our course of realistic fiction had made us less provincial and old-fashioned, and we knew that nobody minded this sort of thing abroad, especially the Russians, of whom we supposed Mickiewicz was one till somewhat languidly set right by Mrs. Williams.

After that her singing made a perfect sensation all about Boston, the more because it was so hard to get her to sing. Her style was peculiar, and was a good deal criticized by those who had never heard her. She never sang anything any one else did—that is, anybody you might call any one, for I have heard her sometimes sing something that had gone the rounds of all the hand-organs, and make it sound new again; but many of her songs were in manuscript, some composed for her by Giudotti, and others old things that he had picked up for her—folk-songs, and ballads, and such. She always accompanied herself, and never from any notes, and very often differently for the same song. Sometimes she would sing a whole verse through without playing a note, and then improvise something between. She always sang in English, which we thought queer, when she had lived so long abroad; but she said Giudotti had told her always to use the language of her audience, and Willie, who had a pretty turn for versifying, used to translate for her. We felt rather piqued that she should ignore the fact that we too had studied languages, but we all agreed that she knew how to set herself off, and indeed we thought she carried her affectation beyond justifiable limits. She had to be asked by every one in the room, and was always saying that it was not worth hearing, and that she hoped people would tell her when they had enough of it, though, indeed, she could rarely be induced to sing more than twice. If her voice was praised, she said she had none; and when she was asked to play, she would say she could not—she could

only accompany herself. A likely story—as if any one who could do that as she could, could not play anything!—and we used to hear her, too, when she was in her own house, with nobody there but her husband. As for him, he overflowed with pride and delight in her music, and evidently much more than pleased her, and sometimes he even made her blush—a thing she rarely did—by his remarks, such as that if we really wanted to know how Loulou could sing, we must hide in the nursery. It was while singing to her baby, it appeared, that the great Giudotti had chanced to hear her, and immediately implored the privilege of teaching her, for anything or nothing.

Minnie Mason said it was impossible that a woman could sing like that unless she had a history; and she spent much of her time and all of her energy for several weeks in finding out what the history could be. It was wonderful how ingeniously she put this and that together, until one day at the club she told us the whole story, and we wondered that we had never thought of it before. It seems that before Loulie Latham was married there had been a love-affair between her and Walter Dana. It is not known exactly how far it went, but her feelings were very much involved. She was too young, poor thing, and too simple, to know that Walter Dana was not at all a marrying man; he could not have afforded it, if he had wanted to ever so much. He was the sort of young man, you know, who never does manage to afford to marry, though in other respects he seemed to get on well enough. He had passed down through several generations of girls, and was now rather attentive, in a harmless, general sort of way, to the married women, and came to our dances.

"And then," said Minnie, "when he did not speak, and she was so suddenly left alone, and nearly penniless, after her mother's death, and Willie Williams was so much in love with her, and so pressing—though I don't believe he was ever in love with her more than he was with a dozen other girls, only the circumstances were such, you know, that he could hardly help proposing, he's so generous and impulsive. But he is not exactly the sort of man to fall in love with, and his oddities have evidently worn upon her; and now she feels with bitter regret how different her life might have been if she could have waited till her uncle left her this money. Walter has got on better, and might be able to marry her now, and she is young still—only twenty-nine. It is the wreck of two lives, perhaps of three. Willie is most unsuspicious, but should he ever find out—"

We all shuddered with pleasurable horror at the thought that we were to be spectators of a Russian novel in real life.

"I have seen them together," went on Minnie, "and their tones and looks were unmistakable. Surely you remember that Eliot Hallgerman he danced with her, the winter before her mother's death—the only winter she ever went into society; and I recollect now that he seemed very miserable about something at the time of her marriage, only I never suspected why then."

"How very sad!" murmured Emmie Richards, a tender-hearted little thing.

"It is sad," said Minnie, solemnly; "but love is a great and terrible factor in life, and elective affinities are not to be judged by conventional rules."

For my own part, I thought Willie Williams a great deal nicer and more attractive than Walter Dana, except, to be sure, that Walter did talk and look like other people. Perhaps, I said, things were not quite so bad as Minnie made them out. It was to be hoped that poor Loulie would pause at the brink. A great many such stories, especially American ones, never come to anything, except that the heroine lives on pining, with a blighted life; and I thought, if that were all, Willie was not the kind of man who would mind it much. Very likely he would never know it.

Blanche Livermore said the idea of a woman pining all her days was nonsense. All girls had affairs, but after they were married the cares of a family soon knocked them all out of their heads. To be sure, Blanche's five boys were enough to knock anything out; but Minnie told us all afterward, separately, in confidence, that it was a little jealousy on her part, because she had been once rather smitten with Walter Dana herself. This seemed very realistic; and I must say my own observations confirmed the truth of Minnie's story. Mrs. Williams did look at times conscious and disturbed. One night, too, Tom and I called on them to make arrangements about some concert-tickets. Willie welcomed us in his usual cordial fashion, saying Loulou would be down directly; and in ten minutes or so down she came, in one of her loveliest evening dresses, white embroidered crape, with a string of large amber beads round her throat.

"I am afraid you are going out, Mrs. Williams; don't let us detain you."

"Not at all," she said, with her usual indifference. "We are not going anywhere. I was waiting up-stairs to see the children tucked up in their beds."

It seemed like impropriety of behavior in no slight degree to fag out one's best clothes at home in that aimless way, but when in ten minutes more Mr. Walter Dana walked in, her guilt was more plainly manifest, and I shuddered to think what a tragedy was weaving round us.

Only a day or two after, I met her alone, near nightfall, hurrying toward her home, and with something so odd about her whole air and manner that I stopped short and asked, rather officiously perhaps, if Mr. Williams and the children were well.

"Oh, yes; very—very well indeed!" she threw back, in a quick, defiant tone, very unlike her usual self; and then, as I looked at her, I perceived to my dismay that she was crying bitterly. I felt so awkward that I did not know what to say, and I stood staring, while she pulled down her veil with a jerk, and hurried on. I could not help going into Minnie's to ask her what she thought it could mean. Minnie, of course, knew all about it.

"She has been in here, and I have been giving her a piece of my mind. I hope it will do her good. Crying, was she? I am very glad of it."

"But, Minnie! how could you? how did you dare to? how did you begin?" I asked in amazement, heightened by the disrespectful way in which Minnie had dealt with elective affinities.

"Oh, very easily. I began about her children, and said how very delicate they looked, and that we all thought they needed a great deal of care."

"But she does seem to take a great deal of care of them. She has them with her most of the time."

"Yes; that's just it. She always has them, because she wants to use them for a cover. I am sure she takes them out in very unfit weather, and keeps them out too long, just for a pretext to be strolling about with him."

"You certainly have more courage than I could muster up," I said. "What else did you say?"

"I did not say anything else out plainly; but I saw she understood perfectly well what I meant."

"I don't see how you ever dared to do it."

"It is enough to make one do something to live next door to her as I do. You know that Walter Dana has not been at either of the last two dancing-classes. Well, it is just because he has been there, spending the whole evening with her alone. I have been kept at home myself, and have seen him with my own eyes going away before Mr. Williams gets home. I can see their front gate from where I sit now, and the electric light strikes full on every one who comes and goes."

I thought this was about enough, but we were to have yet more positive proof. One evening, soon after, we were all at the Jenkses'. It was a large party, and the rooms were hot and crowded. The Williamses were there, and Walter Dana; but he did not go near Loulie; he paid her no more attention in company than

anybody else,—from motives of policy, most probably,—and she was even quieter than usual, and seemed weary and depressed. Mrs. Jenks asked her to sing, and she refused with more than her ordinary decision. "She had rather not sing to-night, if Mrs. Jenks did not mind," and this refusal she repeated without variation. But Mrs. Jenks did mind very much; she had asked some people from a distance, on purpose to hear Mrs. Williams, and when she had implored in vain, and made all her guests do so too, she finally, in despair, directed herself to Mr. Williams, who seemed in very good spirits, as he always did in company. It was enough for him to know that Professor Perkins and Judge Wheelwright depended on hearing his wife, to rouse his pride at once, and I heard him say to her, coaxingly:

"Come, Loulou, don't you think you could sing a little?"

Loulou said something in so low a tone that I could not catch a word.

"Yes, dear, I know; but I really don't think there's any reason for it—and they have all come to hear you, and it seems disobliging not to."

Again Loulie's reply was inaudible, all but the last words, "Cannot get through with it."

"Oh, yes, you will. Come, darling, won't you? Just once, to oblige me. It won't last long."

Loulie still looked most unwilling, but she rose, more as if too tired to contest the point than anything else, and walked over to the piano. Her cheeks were burning, but I saw her shiver as she sat down. Her husband followed her, looking a little anxious, and I wondered if they had been having a scene. Surely the course of dissimulation she was keeping up must have its inevitable effect on her nerves and temper, but her voice rang out as thrilling and triumphant as ever. She sang an English song to the old French air "*Musette de Nina*." It was a silly, sentimental thing, all about parted loves and hopeless regrets; but the most foolish words used to sound grandly expressive as she gave them. When she came to the last line, "The flowers of life will never bloom more," at "never" her accompaniment stopped, her voice shook, struggled with the next words, paused, and a look of despair transformed her whole face. I followed the direction of her eyes, and caught sight of Walter Dana, just visible in the doorway, and, like every other mortal in the room, gazing on her in rapt attention. It was like looking on a soul in torture, and we all shuddered as we saw it. What must it have been for him? He grew crimson, and made an uneasy movement, which seemed to break the spell; for Loulie, rousing herself with an effort, struck a ringing chord, and tak-

ing up the words on a lower note, carried them through to the end, her voice gaining strength with the repetition that the air demanded. No one asked her to sing again; and when she rose Walter Dana had disappeared, and the Williamses left very soon afterward.

Things had come to such a pass now that we most sincerely repented our desire for a Tolstoi novel among us; and if this was life as it was in Russia, we heartily wished it could be confined to that country. We felt that something shocking was sure to happen soon, and so it did; but if you go through with an earthquake, I am told, it never seems at all like what you expected, and this came in a most unlooked-for way. It was on a day when our Tolstoi Club met at Minnie Mason's, and she looked really ill and miserable. She said she had enough to make her so; and when we were all assembled, she asked one of us to shut all the doors, lest the servants should hear us, and then took out, from a locked drawer in her desk, a newspaper. It was the kind of paper that we had always regarded as improper to buy, or even to look at, and we wondered how Minnie had ever got hold of it; but she unfolded it nervously, and showed us a marked passage.

It is rumored that proceedings for a divorce will soon be taken by a prominent Boston artist whose lovely wife is widely known in first-class musical circles. The co-respondent is an old admirer of the lady's, as well as an intimate friend of her husband's.

We all read these words with horror, and Emmie Richards began to cry.

"We ought to have done *something* to prevent it," said Blanche, decidedly.

"What could we do?" said I.

"Poor Willie has n't a relation who could look after those children," murmured Bessie Milliken.

We all felt moved to offer our services upon the spot, but just then there came a loud ring at the door-bell. We all started. It could not be a belated member of the club, for we always walked right in. Minnie had given orders, as usual, to be denied to any chance caller; but in a moment the door opened, and the maid announced that Mr. Williams was in the hall, and wished to see Mrs. Mason.

"Ask Mr. Williams, Ellen, if he will please to leave a message; tell him I am engaged with my Tolstoi Club."

"I did, ma'am; but he says he wishes to see the club." He says it is on very particular business, ma'am," as Minnie hesitated, and looked for our opinion. Our amazement was so great that it deprived us of words, and Minnie, after a moment, could only bow her head in silent affirmation to the girl, who vanished directly.

DRAWN BY A. D. WENZELL.

"I HAVE BEEN GIVING HER A PIECE OF MY MIND."

Could Mrs. Williams have eloped, and had her husband rushed round to claim the sympathy of his female friends, among whom were so many of his old flames? It was a most eccentric proceeding, but we felt that if any man were capable of it, it was poor Willie. But even this conjecture failed, and our very reason seemed forsaking us, as Mr. Williams walked into the room, followed by Mr. Walter Dana, who looked rather awkward on the occasion, while Willie, on the contrary, was quite at his ease, and was faultlessly dressed in a London walking-suit of the newest cut; for he had plenty of such things, though he hated to wear them. He carried a large note-case in his hand.

"Good-morning, Mrs. Mason," he began, "good-morning—" with a bow that took us all in; and without an invitation, which Minnie was too confused to give, he comfortably settled himself on a vacant chair, which proceeding Mr. Dana imitated, though with much less self-assurance, while his conductor, as he ap-

peared to be, went on: "I beg your pardon for disturbing you; but I am sorry to find that you have been giving credence, if not circulation, to some very unpleasant and utterly false rumors concerning my wife's character. I do not know, nor do I care to know, how they originated, but I wish to put a stop to them; and as Mr. Dana is the other person chiefly concerned in them, I have brought him with me."

I believe we felt as if we should like to sink into the earth; nay, it seemed to me that we must have done so, and come out in China, where everything is different. Willie Williams, without a lisp, without a smile, grave as a judge, and talking like a lawyer opening a case—it was a transformation to inspire any one with awe. He saw that we were frightened, and proceeded in a milder tone, but one equally strange in our ears.

"Don't think I mean to blame you. I know women will talk, and I do not believe any of you meant the least harm, or dreamed of things

DRAWN BY A. D. WENZELL.

"THE FLOWERS OF LIFE WILL NEVER BLOOM MORE."

going as far as they have. Indeed, Louise[!] attaches no importance to it whatever. She says it is only idle gossip, and will die out if let alone, and she did not wish me to take any notice of it; but I felt that I must do so on my own account, if not on hers. I don't care what trash gets into such journals as that," and he looked scornfully at the unhappy newspaper, which we wished we had never touched with a pair of

tongs; "but I do not want our friends and neighbors to think more meanly of me than I deserve, when I have it in my power to put a stop to it at once. Mr. Dana, is it true that you and Mrs. Williams were ever in love with each other?"

"It is not," replied Mr. Dana, who began to take courage under the skilful peroration of his chief. "I was never on any terms with Mrs. Williams, when she was Miss Latham, but

those of the very slightest and, of course, most respectful acquaintance. I don't believe we ever exchanged a dozen words."

"I believe you," murmured Blanche Livermore, who sat next to me, and whose unruly tongue nothing could long subdue; and indeed we had none of us supposed that Loulie Latham conducted her love-affairs by means of conversation.

"Did you dance the german with her at the Eliot Hall Assembly on January 4, 188-?"

"I regret very much that I never had the pleasure of dancing the german with Mrs. Williams. At the party to which you refer I danced with Miss Wilmerding."

We all remembered Alice Wilmerding and her red hair, just the shade of Loulie Latham's, but which had not procured her an artist for a husband; indeed, it had not procured any at all, for she was still single.

"Neither," pursued Willie Williams, "is there any truth in the report that Louise was obliged to marry me for a support. She had no need to do so, being possessed of very sufficient means of her own, as I can show by her bank-account at that date."

How he had got hold of every scrap we had said to one another, and even of all we had thought, we could not imagine then, but we afterward found out that he had procured every item from the editor of that horrid paper, under threats of instant personal and legal attack; and as to how this person happened to know so much, I can only advise you not to say or think anything you would be ashamed to have known while there are such papers in existence.

"The only reason that Loulou and I married each other," went on Loulou's husband, "is that we loved each other; and we love each other now, if possible, twice as much as we did then. If you think she does not care for me because she is not demonstrative in company, you are mistaken. She gives me as much proof of it as I want. We all have our peculiarities, and I know I have a great many which she puts up with better than most women would. Of course I don't expect her to be without hers either; but they don't trouble me any more than mine do her, and, besides, most of what has struck you as singular in her behavior can be easily explained. You have thought she was conceited about her music, but it's no such thing; she has not an atom of conceit in her; indeed, she thinks too humbly of herself. She has heard so much music of the highest class that she thinks little of any drawing-room performance, her own or anybody else's, and her reluctance to sing is genuine, for she has a horror of being urged or complimented out of mere politeness. You are not pleased, I hear" [*how* could he know that?], "that she refused to join

all your clubs and classes; one reason was that she really did not care to. Every one has a right to one's own taste; she has met a great deal of artistic and literary society abroad, and has become accustomed to live among people who are doing something; and it is tedious to her to go about so much with people who are always talking about things, as we are given to do here. She is really fond of hard reading, as but few women are; and she likes better, for instance, to stay at home and spend her time in reading Dante by herself in the original, than to go to a club and hear him talked over, with a little skimming from a translation interspersed. She dresses to please me and herself, and not to be envied or admired; and if she has a fondness for pretty clothes for their own sake, that is not surprising, when she had so little chance to indulge it when she was a girl."

Here he paused, and it was high time, for we were growing restive under the catalogue of his wife's virtues; but in a moment he resumed.

"There is another reason, too, why she has not been more sociable with you all. You don't know how unhappy Loulou is about her children; but you do know, perhaps, that we have lost two,"—here his voice faltered slightly, with some faint suggestion of the Willie Williams of our old acquaintance,—"and she is terribly afraid that the others will not live to grow up. I don't think them as fragile as she does; but they do look delicate, there's no denying it. We came home, and here, very much on their account; but yours are all so healthy and blooming that it's almost too much for poor Loulou sometimes, especially when people—" he was considerate enough not to look at Minnie—"tell her that they look poorly, and that she ought to be more careful of them. How can she be? She is always with them—more than is good for her; but she has an idea that they won't eat as much as they ought, or go to sleep when they should, without her; and she never leaves them at lunch, which is, of course, their dinner. I think she is a little morbid about them, but I can't torment her to leave it off; and I hope, as they get older and stronger, she'll be more cheerful. It is this that makes her out of spirits sometimes, and not any foolish nonsense about being in love with anybody else."

"*Mon âne parle, et même il parle bien!*" whispered the incorrigible Blanche, and though I don't think it fair to call Willie Williams an ass at any time, our surprise at his present fluency was nearly as great as the prophet's. He seemed now to have made an end of what he wished to say, but Mr. Dana, whose presence we had nearly forgotten, looked at him meaningly, as if in request.

"Oh, yes — I had forgotten — but it is only due to Mr. Dana to say that he has been coming to my house a good deal lately on business. I would tell you all about it, but it's rather private." But, humbled as we were, we could not hear this without a protesting murmur, disclaiming all vulgar curiosity. I did, indeed, wonder for a moment if he were painting Walter's portrait; if he were, I did not think it strange that the latter looked a little sheepish about it; but I afterward found out through Tom that it concerned some good offices of them both for an old friend in distress. "When he came to my house in the evening when I was out, it was to meet another person, and Mrs. Williams, half the time, never saw either of them. As to that song at Mrs. Jenks's party, which, I hear, created so much comment, she was feeling very unhappy that night because little Violet had a cold, and she thought she might have made a mistake in trying to keep her out, and toughen her, as you do your children here. Perhaps that heightened her expression; but as to breaking down on the last line of the song, that effect was one of Giudotti's lessons, and he taught her how to give that look. He always said she had the making of a great tragic actress in her. She does try to look at the wall," went on Willie, simply, "but it was so crowded there that she could not, and Mr. Dana could not help standing in the way of it. I think I have said all I need say — and I hope you won't mind it or think I am very impertinent, but I could n't bear to have this thing going on; and I hope we shall all be as good friends as we were before, and that it will all be very soon forgotten." And he bowed and departed, followed by Mr. Dana, with alacrity.

We were doubtful as to these happy results. We could all admire Willie Williams for standing up so gallantly for his wife, but we did not like her any the better for being so successfully stood up for, and we felt we could never forget the unpleasant sensation he had given us. It took a long course of seeing him in his old

shape and presentment among us — working, in the same flamboyant clothes, at paintings as execrable as ever; with the same lisp, and the same trip and jerk, and the same easy good nature, and trifling enthusiasms — to forget that he had ever inspired us with actual fear, and might again, though he never has. We came also, in course of time, to like Lou-lou better, though it was rather galling to see how little she heeded the matter that cost us all so much remorse; but she lost her reserve in great measure as her children grew healthier and more like other people's. I think the hatchet was fairly buried for good and all when, in another year, she had another baby, a splendid boy weighing nine pounds and three quarters, at whose birth more enthusiasm was manifested in Babyland than on any similar occasion before, and who was loaded with the most beautiful presents, one in particular from Minnie Mason, who was much better, for her recovery of health dates from that sudden incursion into our Tolstoi Club, and the shock it gave her.

I should have said as to that, that after the men had left us Blanche Livermore exclaimed, "Well, girls, I think we are pretty sufficiently crushed!"

This was generous of Blanche, when she was the only one among us who had ever expressed any incredulity as to the "Russian novel," as we called it. "The fact is," she went on, "I have come to the conclusion that we have not yet advanced to the realistic period here; we are living in the realms of the ideal; and, what is worse, I fear I am so benighted that I like it best; don't you?" And, encouraged by an inarticulate but affirmatory murmur from all of us, she proceeded:

"Let us all agree to settle down contentedly behind the age in our provinciality; and, that we may keep so, let us cut the realists in fiction, and take up something they don't approve of. I vote that we devote the rest of the season to a good thorough course of Walter Scott!"

And so we did.

Dorothy Prescott.

LOVE AND LIFE.

"GIVE me a fillet, Love," quoth I,
 "To bind my sweeting's heart to me,
 So ne'er a chance of earth or sky
 Shall part us ruthlessly.
 A fillet, Love; but not to chafe
 My sweeting's soul, to cause her pain,
 But just to bind her close and safe
 Through snow and blossom and sun and rain.
 A fillet, boy!"
 Love said, "Here's joy."

"Give me a fetter, Life," quoth I,
 "To bind to mine my sweeting's heart,
 So Death himself must fail to pry
 With bitter Time the two apart.
 A fetter, Life, that each shall wear,
 Whose precious bondage each shall know.
 I prithee, Life, no more forbear —
 Why dost thou wait and falter so?
 Haste, Life; be brief!"
 Said Life, "Here's grief."

THE VILLAGE ROMANCE.

MRS. CATHERINE PEMBROKE, a stout young matron, sat in the vine-checked shade of her own back gallery, watching Uncle Ned stake the pease in the garden.

"You 'll have to cut some more brush for that back row," she was just saying, when Fanny, Uncle Ned's yellow granddaughter, bounced around the corner of the house, and stood in the path, at the foot of the steps, dilating with excitement.

"La, Miss Cat'rine, I jes hyarn de awfus news, an' it's true, plumb true. I jes now run up to Miss Marg'et Martin's to git dat cape jassamine she done promise—yes 'm; I 'm a-tellin' you as fas' as I kin. I dat out of bref—dey is all in turrible state up dere. Yes 'm; 't is about Miss Mary Bell. She done say—jes now, not an hour ago—dat she wone git mah'ed nex' Thosd'y at all; she wone git mah'ed no time, she say. Dey donestop bakin' de cake. No'm; dey say ain't been no qua'l at all. Mars Nelson he come up dere jes little while ago to see 'bout sumpin', an' Miss Mary Bell she jes sent 'im down a note statin' dat she got no 'tention of mah'in' 'm. He prett' nigh wil', dey say, an' de ole Squiah he dat bu'stin' wid mad dey 'fraid he fall in fit. Miss Mary Bell done lock huhse'f up in huh 'oom, an' wone say nuffin' to nobody, 'cept jes dat she wone git mah'ed."

When everything that Fanny knew about the unprecedented situation of the Martin family had been extracted from her, Miss Catherine resumed her dignity by saying:

"Fanny, you always talk too much about white people's business, anyhow, and I won't have you coming from Miss Marg'et's and setting the whole town afire. You come into the house now, and go finish winding them carpet-rags. Miss Marg'et did n't say anything about my coming up there, did she?" she weakly added, as Fanny was sullenly sitting down to her task.

"No 'm," was the over-prompt reply; "I hyarn her say she hope she not got to look a soul in de face for a monf."

"Wind that there ball tighter 'n that, or

UNCLE NED AND FANNY.

you 'll have to do it over," said the mistress, and resolutely put on her sunbonnet, and stepped firmly across the street to the house of her husband's cousin, Mrs. Kitchens.

Such a state as Strathboro' was in that day!

No sooner was Miss Catherine's back turned than all the negroes in the "yard"—there were a dozen of them, big and little—gathered on the gallery and its steps to discuss through the window the news Fanny had brought and for which she had been so ill rewarded.

Before night everybody in Strathboro' knew the little all that was to be known of Mary Bell's unparalleled fickleness; for a girl to break an engagement, that was nothing, but to do it when the "invites" to her wedding were out, and the cake was a-baking, and some of the Allison County kin were actually in the house—there was nothing to do but to watch for chance

visitors from the country to whom the whole story could once more be recited.

Time added few details to it. The Martin family were terribly afflicted, but they bore the prominence thrust upon them dumbly; the stout, grim Squire "took" to his farm; Mrs. Martin, a dim, faded beauty, stayed away from church one Sunday, but gathered herself up and came the next, Mary Bell by her side, and the impassivity of the Sphinx upon her face.

No one was allowed to refuse to see a visitor in Strathboro', but no barbarity of custom could cope with Mrs. Martin's genius for silence, and no one left her a whit the wiser as to facts or feelings regarding the tragedy within her realm. Mary Bell had not inherited her mother's prettiness,—this fact was generally assumed to enhance her mother's present grief,—but she had perhaps chosen the better part in making the maternal gift of silence her own. She now presented Strathboro' with an even more monumental form of it. All this was presently appreciated as really enhancing the interest of the situation, though for the time being it was grievous.

"I tell you," said Mrs. Pembroke to Mrs. Kitchens, "no one knows what that poor girl is going through."

"Pore gyurl" was precisely what Miss Catherine said, and I am constrained to mention it both because it conveys to my ear a superior degree of compassion, and also as sufficiently indicating the quality of the Strathboro' accent.

"Mary Bell," she went on, "was always mighty still and close about the very things that touched her feelings most, and that kind suffer mightily, in my opinion. There was never a girl more in love than Mary Bell. Not that she ever carried on soft, or that, but then look—she was engaged to be married to Nelson Croft before she had known him two months, and they do say that she sought him out and pressed him to come and see her, when they were first acquainted, to a degree that would have been called forward in most girls; but Mary Bell not being handsome, and having that kind of dignified way with her, she could do things others could n't. And when they got engaged, why, she expected him to come and see her every night, and old Aunt Viney told Uncle Ned—though I am not one to pay any attention to nigger news in general—that if ever he did n't come, she got that restless, for all she so heavy-like, that she'd go up and walk her room, and they could see her shadow coming and going on the window-curtain, off and on, till mighty nigh ten o'clock. Oh, I tell you, Maria, Mary Bell's eating her black bread now!"

"Poor Mary Bell!" exclaimed Mrs. Kitchens, sympathy and relish equally expressed in

her tones; for you see the village was already beginning to feel that here was a romance—its romance, its contribution to the history of poetic pain.

This was after all speculations as to a reconciliation had died away; Nelson Croft had left the town, and there was no prospect of the finale taking the commonplace and disappointing form of a speedy marriage. The possibility of that culmination was soon made properly remote and difficult. Within three months Mary Bell "up" and married somebody else. The stern and inexperienced idealist might suppose that this was death to the romance, but he would be altogether wrong. He does not understand the terms on which romance has to live in a world like this, or the completeness of the acquiescence of mankind in these little necessary compromises.

The marriage was accomplished before Strathboro' had fairly gotten a hint that it was to be, and this time Mrs. Kitchens had the triumph of announcing the news to Mrs. Pembroke. She found her where we saw her first, sitting knitting in her back gallery, but the pea-vines were pod-hung and yellow-green now, and overflowed Uncle Ned's brush. Mrs. Kitchens was a thin, pale little woman, but she got a color as she hurried through Mrs. Pembroke's long hall without the preliminary of knocking.

"Catherine," she broke forth, "do you know what's happened? Mary Bell Martin has just got married—to Tim James. Mr. Eaton has just come from there, and A'nt Rose's Joe heard him tell Harry Maury on the Square that he'd been marrying of them."

"Well, well, well!" exclaimed Miss Catherine, with reflective accents. "Sit down, Maria, sit—You, Pete, come fetch your Miss Maria a chair. Poor girl! And she's tried to drown her sorrow by marrying Tim James. Poor girl!"

"You don't think, then," said Miss Maria, "that she's caring anything about Tim? He used to go to see her some, I believe."

"La, Maria, Tim James has been running in and out of Miss Marg'ret's ever since he was knee-high, same as he does at his own mammy's; but Mary Bell care about Tim now, after all that's passed? No, Maria; women's hearts ain't made that way." And Maria was relieved.

All the town soon settled into views of the union in the main harmonious with those expressed by Miss Catherine, and the romance was fairly established; it became the Romance. The interest soon dropped to the gentle and pensive point, but it never became indifference; on the contrary, time encircled it with its own charm. Never was the value of mystery better demonstrated; for this it was, of course, that made a heroine of Mary Bell Martin. She let

DRAWN BY E. W. KEMBLE.

SQUIRE PEMBROKE.

concealment, like the little coral insect, build a pedestal for her.

Her story soon took precedence over various vivid experiences of life which the village had vicariously enjoyed; for it was at this time only fifteen years since Jim Cajour had shot down old Judge Thompson on the Square, and hardly ten since Sally Simmons had run away with a Yankee trader. The Romance indeed held its own, not only against rivals already in the field, but distanced all competition for popular favor for the next fifteen years, and girls who were only learning to walk when Mary Bell took her wayward matrimonial course at last found in Miss Catherine's dramatic presentation of her veiled sorrows their favorite love-story.

"And Mary Bell, from that day to this, has never been heard to mention Nelson Croft's name,"—that was her usual formula of conclusion. And then, on summer evenings, the girls would steal away from her, and, winding their arms about one another's waists, would walk up and down before Timothy James's modestly comfortable dwelling, studying his wife's ample figure as she rocked back and forth in her gallery amid her progeny, and speculating upon her tragic history.

Mrs. James was a hearty, well-ordered woman, whose house and whose children were admittedly up to the average, and who won deep encomiums from the neighborhood authorities for never going anywhere; and yet Mr. James was not exactly a cheerful man. He was the superfluous figure in the Romance, and he

seemed to feel it, though he was a gentle creature, and far from the spirit of complaint at his lot. On the contrary, one would have said that he felt that Mary Bell's bestowal of herself on him under the circumstances placed him under heavy obligations to her; perhaps that was it—the obligations were too heavy. Certain it is that he always wore an apologetic air. It had now become part of the story that within a year after his marriage he took to drink, but that solace he must soon have abandoned; it demanded a hardihood his temperament did not furnish. At last, after sixteen years' effort to meet the situation with dignity, Timothy finally managed it by dying.

Amid the decorous interests of the funeral, and checked undoubtedly by some sorrow for the weak supernumerary, the new possibilities of the Romance were pushed into the background, but in a quiet way the canvass of them soon began.

The elders generally expressed themselves by nods and half-spoken hints, but Miss Catherine unbosomed herself to the sympathetic girls more freely.

"Nelson Croft's wife's been dead more 'n ten years," she said to three of them, as they sat around her sitting-room fireplace.

"Why, I did n't know he'd ever been married," said one callow listener, in accents of disappointment.

"Married! Of course he's been married," replied her hostess, impatiently. "Married a girl there in Memphis, where he lives, and they had one child, and both it and its mother been dead ten years. And that Nelson Croft ain't never married again," she continued, "is proof positive to my mind that he cares yet about Mary Bell. Of course," she added, with delicious prudence protecting the Romance against all hazards,—“of course, it may be he'll never come around her no more. He hears nothing to speak of from Strathboro', and after the way Mary Bell treated him I dare say he don't want to."

DRAWN BY E. W. KEMBLE.

THE COURTSHIP.

The girls were not discouraged by this; they had faith in the future of the Romance, and it did not wane, though before anything happened to justify it time enough elapsed for some of them to experience courtship, marriage, and motherhood.

But one spring evening the Square was agitated by the arrival of a stranger in the stage—a stranger who alighted at the village tavern, an establishment rarely thus disturbed.

"Dressed a good deal like a Yankee, was n't he?" asked Squire Pembroke as he came down the court-house steps.

"He'd got on a stiff hat, Squire; but I seen heaps of fellows in them hats when I was in Memphis Christmas before last," eagerly answered a shabby man in the group of loungers, desiring to entertain the Squire on terms of equality.

Not finding it to square with his dignity to say more, the Squire was passing on, when the stage-driver came up, and he stopped perforce to listen for his revelations.

"Brought over a stranger to-night, Bill," said one.

"Well, I don't know altogether about that," said Bill, running his hands into his pockets and gazing around with suave and conscious power.

"Who was he, then?"

"What did he go to the tavern for?"

"Miss Mary Bell seemed to be acquainted with him," said Bill, sighting a post as the mark for a stream of tobacco-juice.

"Miss Mary Bell James?"

"Yes," explained one of the group, hurriedly, that the revelations might not be delayed; "she went over to the Branch day before yesterday to Bassom's funeral; Bassom's wife kin to her."

"Bill, you don't suppose that man was Nelson Croft?"

"I don't suppose nothin' else."

A dramatic pause ensued. The Squire started off; he knew his duty as a husband. His zeal outran his discretion; the less devoted ones who stayed and pumped Bill dry received more gratitude and fewer reproaches from their womenkind.

Miss Catharine had to visit across the street before she could eat her supper.

"It's not, Maria, that I'm busying myself about the concerns of others," said she; "this town must know by this time that no woman in it ever stayed at home closer or knew less about her neighbors than me, for the most part; but we that have known Mary Bell all these years must have some human feeling about that meeting, and here the Squire comes home and don't know a blessed thing about the particulars of it. Bill said they talked to each other, did he? But he did n't know which begun it?"

Well, well, well! I wonder if he could have recognized Mary Bell after all these years. Mary Bell carries considerable flesh these days, but she's kept her looks better 'n some that had more to start with. Well, well! Love's a wonderful thing, Maria!"

"I never knew him till he began to ask Bill about Strathboro' people," said Mrs. James to one friend after another, "the Sykeses and them; and then Bill he turned to me, and says he, 'Miss Mary Bell, you hear from Jim Sykes's folks, don't you?' and then Nelson turned and stared at me, and finally he said, 'Miss Mary Bell as was Miss Mary Bell Martin?' and then I spoke his name; seemed as if I spoke it before I fairly sensed in my mind who it was."

This little statement, made without substantial variation or enlargement, and with entire simplicity, Mrs. James gave whenever her account of the meeting would have been conspicuous by its absence. She was now, as ever, dignified, unaffected, and reticent. The public imagination was left a fair field. Nelson Croft wandered about the village, the next day, a somewhat melancholy figure. He had lived in Strathboro' only a year, and had there no kinspeople; and indeed if he had spent all these intervening years in the place, he would still have been accounted in a degree a stranger, though a stranger in better standing. Strathboro' had an unmistakable distrust of those mortals who had passed much time in fields beyond its ken. It never felt sure in such cases what standards of judgment were being turned upon it, and it had to receive marked evidence of regard for its own dignities and proprieties before it gave its good graces to such unknown quantities.

Nelson lounged around the Square the first day, and it did not help him to popularity that he failed to embrace the first opportunity to explain his presence, expound his past, and express his hopes for the future.

It was not till the day after this, when he took his way up to Mrs. James's gate, that the tide definitely turned in his favor.

"Them as comes a-courtin' will be sly," was a formula of justification that found favor with the soft-hearted.

The widow was sitting in her back gallery sewing a pair of small trousers. She heard the gate-latch click, and, peeking around the door, through the open hall, saw her visitor coming up the box-bordered walk. A smile, not without humor, crossed her face.

"A'nt Nervy," she called across to the log kitchen some yards away, "there a gentleman comin' up the walk; get your hands out the flour so you can go to the door. Just bring him out here. Bring out that hickory-bottom chair; it's a heap more comfortable than the others."

And Mary Bell redirected her attention to the little trousers.

Three days later, as she sat in the same spot, Nelson was saying to her in a pleasingly dispassionate tone:

"It appears to me, Miss Mary Bell, that it would be a good thing for us both if you could conclude to marry me."

He was leaning forward on his chair, his profile turned toward the object of his suit, and was placing his finger-tips together in front of him with judicial care, while his gaze was fixed reflectively on a brood of small chickens darting about in the yard below. Mary Bell was knitting.

"You see," he went on, "it is n't like I wanted you to go away and leave things here. You are fixed comfortable, and what I want would only make you comfortabler. You say yourself that the farm wants a man to look after it, and, as I told you, there 's a good chance for me to come back to Strathboro' and do pretty well. I have n't any idea of getting rich in Strathboro', but then you ain't likely to get rich without me, and it 's my idea that we would advantage each other."

This speech was broken by several marked pauses, but Mary Bell knitted away rapidly without a word, though her expression was attentive.

"Besides," said Nelson, after another pause, readjusting his finger-tips, and now turning his intent gaze upon them,— "besides, it seems to me sort o' proper and right that you should marry me in the end. You treated me pretty badly, Miss Mary Bell."

"Yes, Mr. Croft, I did," said Mary Bell, plumply; "I never had a word to say for myself about that business, though it seems little enough to me now like it was me that did it."

"Sure enough," said Nelson, turning to her with interest, "it don't seem much like it was me that you mistreated, either; but I feel sorry for the boy that was me then, some; seems as if it would be a good idea for me to try to make it up to myself, long as I can't get at him."

"And do you think I could make it up to you?" said Mary Bell, with a faint flash of something resembling coquetry, as she pursed up her lips and counted her stitches.

Nelson looked a little puzzled as he answered slowly:

"Why, Miss Mary Bell, that 's my idea. I 'd be mighty glad if you could see it the same way; it seems to me as if the case fits all around."

"Well," said Mary Bell, rolling up her work and sticking the needles through it, "I don't see as I can do anything else; though as for your taking care of the farm, I have n't much

idea you know as much about that as I do. Howsomever, any man can ride around and see what the hands are doing better 'n a woman."

Mary Bell had risen now, and, pretty well filling the hall door with her ample proportions, she stood on its threshold, running her needles in and out of her ball as with downcast eyes she continued:

"Anyhow, it 's—well—a woman feels it some when she 's remembered so many years." And with this the just and staid Mary Bell turned with a lightness surprising and not ungraceful, and disappeared.

Nelson got up with a definite change of expression, and followed her into regions beyond the interested gaze of Aunt Nervy.

"Miss Mary Bell," said he, some days later, with an air laboriously *dégagé*, "perhaps it 's not the thing for me to ask, but the mind will wonder, you know—the mind will wonder, and if you 've no objections, I 'd like to ask—it 's for you to answer, of course, or not. My inquiry is, Why did you stop that wedding of ours when we were young people? Though, as you 've said, it don't seem much like it was us, but still, the mind will wonder, and I 'd—I 'd like to know."

Mary Bell was silent for a moment; then she said: "There is no reason why I should n't tell, and there 's no reason why you should n't ask; but it is the truth, it seems going back dreadful far to remember anything about it. It seems to me now as if I must have been the flightiest, wilfullest girl that ever drew breath. The fact is, those days I was just entirely taken up with Tim James, and when we quarreled,—it was something about one of the Benson girls,—why, I was glad to be courting with you to spite him. Then when pappy did n't like that, seems as if I was just egged on till I really did think I wanted you. But when the wedding came so close, and I was mighty nigh married to you sure enough, why, then, like the perfectly uncertain object I was them days, I just thought I 'd die if I did n't have Tim. I wished I 'd never see you again to the end of time."

"Well, you 've got over that," said the whilom jilted one, cheerfully.

"Yes, sir; I have," declared Mary Bell, calmly. "Young folks are terrible foolish."

"Did Tim understand how it was?" asked Tim's successor, reflectively.

"Perhaps he did, and perhaps he did n't," replied his widow, with conclusive inflections, while her knitting-needles clicked. "'T ain't always best that a man should know too much." And with this two-edged oracular utterance she resumed the silence with which she had for years dignified her early passionate vagaries.

When the lovers were married, as they were speedily, there was such wide-spread commen-

dition of the union as never blessed another in that town.

Tim's own relatives acquiesced, after finding that in the sentimentally besotted state of public opinion even the prospect of a step-father over Tim's children aroused no appreciable indignation.

"Well, Judge," said Squire Pembroke with gentle pride, when he met a neighbor on the day of the wedding, "that 's quite a romance that 's getting finished over there," with a nod toward the house Tim James had built.

"Yes, sir; yes, sir," said the Judge, ponder-

ously; "the human heart is a strange thing, and we see right before us in Strathboro', sir, a— a marvelous example of its strangeness, sir."

"Just to think of those two poor creatures coming together after all these years," sighed Miss Catherine, wiping her eyes at the supper-table that night. "It 's a comfort to think things can happen so sometimes in this world, for Lord knows most of us don't have much that 's romantic in our lives."

"That 's true, that 's true, I 'm afraid, Cathy," said the Squire, humbly.

Viola Roseboro'.

ODE TO SPRING.

I WAKENED to the singing of a bird;
I heard the bird of spring.

And lo!

At his sweet note

The flowers began to grow,

Grass, leaves, and everything,

As if the green world heard

The trumpet of his tiny throat

From end to end, and winter and despair

Fled at his melody, and passed in air.

I heard at dawn the music of a voice.

O my belovèd, then I said, the spring

Can visit only once the waiting year;

The bird can bring

Only the season's song, nor his the choice

To waken smiles or the remembering tear!

But thou dost bring

Springtime to every day, and at thy call

The flowers of life unfold, though leaves of autumn fall.

Annie Fields.

LOVE IS A BIRD.

LOVE is a bird that beats against thy breast,
And seeks in thy warm heart to make his nest.
Ah, gentle maid, wilt thou not let him in?

Far has he flown across the world to-night;
Through wind and storm he seeks thy bosom bright.
Arise, dear maid, and let him enter in.

Joyful the heart he makes his dwelling-place;
He bringeth bloom and gladness to the face.
Ah, gentle maid, wilt thou not let him in?

His little bosom flutters wild and fast;
He hath no shelter from the raging blast.
Oh, haste, dear maid, and let Love enter in.

William Prescott Foster.

THE FARMER AND RAILWAY LEGISLATION.

THE interests of the farmer in just and conservative management of railways are not at all different in kind from the interests of every other well-meaning citizen; and the laws required by him to render those interests secure are of the same sort as are required by any class of men who rely for a livelihood upon the production of articles for distant markets. In some respects, however, agriculture is a peculiar business, and there are some reasons why the demand of the farmer for fair treatment in the transportation of his produce comes with special force and directness. For it must be noted that agriculture is of all industries the least flexible. The merchant is able to shift from place to place and so to adjust himself to changing conditions; the manufacturer, although his business is less mobile than that of the merchant, is, nevertheless, able to control in large measure the conditions under which he carries it on; but the farmer, on account of the absolute fixedness of his plant, enjoys no such advantages. With free money in hand it is possible for him to settle wherever commercial conditions invite; but his capital having once taken the form of reclaimed land, fences, drains, buildings, and the like, he is tied to the soil. His produce is assured as freight to the railway, or association of railways, that commands the territory in which his investment lies, and on this account he is at the mercy of those who provide him an outlet to the market. He has no recourse in case of unfair treatment except an appeal to Government.

For another reason, also, the industry of agriculture is at a relative disadvantage, when considered in its relation to the question of transportation. The merchant and the manufacturer are constantly receiving and shipping goods, and are on this account in a condition to take advantage of fluctuating rates. The rates which they actually pay will likely be less than the average of general charges; but the farmer, who has a single harvest during the year, cannot cut and trim to get the better of fluctuating rates. He it is who, in the presence of fluctuating charges for transportation of freight, is likely to carry the heavy end of the beam. It is, therefore, the occasion of no surprise, because inherent in the nature of agriculture as an industry, that farmers should be more directly interested in railway legislation

than any other class of business men. Their appeal to Government is one of the natural outcomes of the situation in which they find themselves.

But what is the nature of the enactments which have resulted from the appeal of farmers to the makers of law? We shall be assisted in answering this question if we call to mind the peculiar character of the business of transportation by rail, for the only purpose of railway legislation has been to check the evils which flow from unregulated railway administration.

From 1848 to 1870 railways were regarded by managers, by legislatures, and by the courts, as subject to the satisfactory control of commercial competition. It was thought that the public had nothing to fear, provided only there were a sufficient number of railways to insure competition. Of course, under such circumstances it was impossible for a railway problem to make its appearance, since all parties interested were agreed as to the theory of railway management; but as the development of the country provided a continually increased traffic, experience showed that competition between railways was not of that conservative and steady sort which commends itself to the judgment of reasonable and fair-minded men. Certain clearly defined abuses forced themselves upon public attention, and among the questions which statesmen were obliged to consider, the question of the administration of railways assumed a prominent place.

The reason why competition cannot control in railway affairs may be easily stated. The railway business is a business subject to what economists call "the law of increasing returns"; that is to say, the larger the traffic the less will be the cost of carrying any portion of that traffic. This being the case, the criterion of success in the business of transportation comes to be the volume of traffic that can be controlled, and a practical railway manager considers only the means of securing for his line the largest possible volume of traffic. Under the impulse of such a purpose certain evils are sure to arise, prominent among which may be mentioned the evil of unstable charges for traffic. The truth is, rate-sheets have never been adjusted in a scientific or rational manner, but have evolved themselves out of a prolonged strife for traffic; and as in times of war a plan of campaign must be continuously modified to meet temporary exigencies, so rate-sheets of railways are subject to constant modification, either to in-

crease traffic at the expense of a rival, or to save traffic which a rival seeks to secure. All businesses which have to do with railways are, on account of uncertainty in freight-charges, rendered speculative in character, and this, when properly understood, is an evil which cannot be too seriously regarded.

But the burden of fluctuating rates rests upon the farmer in a peculiar manner, because they render it difficult for him to reach the central market. It is sometimes asked why farmers do not themselves send their produce to the market, and consign it to commission merchants who shall place the proceeds of its sale to their credit. In this manner the number of middlemen who live from handling produce would be greatly decreased, and there would result a much better organization of national industry than the one which now exists. The farmer would indirectly as a member of the community, as well as directly in his capacity of a producer, be decidedly benefited by the change. One cannot say that such a step would be taken by the farmers should freight-rates be rendered more stable, but it is certain that without stable rates such a step must forever be impossible. From every point of view fluctuating charges for transportation of freight are to be deprecated.

Much more serious, however, is another class of evils resulting from unregulated competition between railways. Not only do rates fluctuate in an arbitrary manner, but all persons doing business with railway corporations are not charged the same rates. Unfair discrimination between customers is, like fluctuating rates, a result of the struggle for traffic. Large shippers secure better rates than small ones, and cities command more advantageous terms than towns. One who appreciates the social functions of railways cannot express too strongly the evils consequent upon such an abuse of power. They are second only to those which would follow should courts discriminate between citizens in the dispensation of justice. Equality before the law is a canon of political liberty; equality before the railways should become a canon of industrial liberty. Since, however, the evils of discriminating charges, special contracts, rebates, and the like are familiar topics in every discussion of the railway problem, nothing further need be added here respecting them.

Coming, then, directly to the question asked, it may be said that the aim of railway legislation in this country has been to correct abuses necessarily incident to the unregulated competition for traffic between railways. Experience has shown that commercial competition does not work in the business of transportation as it works in the case of other businesses, and the

aim of laws to regulate railways has always been to bring the competitive principle under the control of the political principle in all matters affecting the public. It is true that much confusion exists in the laws that have been passed, but all harmonize in this—that they set before themselves the same problem.

The first step actually taken toward control of railways in this country was to place beyond question the right of Government to a voice in the management of railway affairs, and this is a step for which the farmers of Illinois, Iowa, and Wisconsin are directly responsible. The "Granger Laws" of about 1870, which were contested by the railways, but upheld by the courts, placed beyond controversy the fact that railways are common carriers in the extreme interpretation of that phrase, and, as such, are amenable to direct legislative control. This was an important point gained, since it rendered unnecessary further discussion as to the right of public control. It did not, however, touch directly the railway problem which pertains to the most practical and effective methods of exercising public control over carriers among a democratic people.

If we consider the laws themselves that have been passed for the purpose of regulating the relations of railways to the public, two principles may be observed running through them all. On the one hand there are many enactments whose aim it is to compel competition, or, what means the same thing, to prevent combination; for it must be noted that, side by side with fierce competition to which reference has been made, and which results in fluctuating rates and special favors to large shippers and large places, there is always present in the minds of those who direct railway affairs the hope of consolidated management. The cutting of rates is regarded in the light of a battle that is to lead to an advantageous treaty of peace. Besides the law of Congress which forbids pooling, a number of States have passed laws having for their purpose the maintenance of competitive conditions between railways. These States are Alabama, Arkansas, California, Colorado, Iowa, Kansas, Minnesota, Missouri, Nebraska, New Hampshire, Nevada, North Carolina, North Dakota, Oregon, South Carolina, South Dakota, Texas, and Wisconsin. It is not necessary, however, to say much respecting this class of legislation, for its advocates are coming to admit that it has not met their expectations. Indeed, the futility of law to prevent consolidation seems to cast suspicion on the theory on which such laws are based.

The other principle upon which reliance has been placed for the solution of the problem of transportation is found in those laws which aim to secure and maintain fair rates. Such laws

embrace three separate counts: first, that rates themselves should be just, the nature of the service being taken into consideration; second, that rates should be the same for all, with no invidious discrimination; and third, that rates should not be subject to frequent or arbitrary changes. The doctrine that Government should enforce a just price is not new. It has the sanction of Roman law, of mediæval custom, and of common law. "In countries where the common law prevails," said the late Chief Justice Waite, "it has been customary from time immemorial for the legislature to declare what shall be a reasonable compensation." It may, perhaps, be surprising to learn how far this principle of a "just price" has permeated American law. Confining the statement to railway legislation, it may be found in some of its phases in Federal law, and in the laws of the States of Alabama, Arkansas, California, Colorado, Connecticut, Florida, Georgia, Illinois, Iowa, Kansas, Kentucky, Maine, Massachusetts, Michigan, Minnesota, Mississippi, Missouri, Montana, Nebraska, Nevada, New Hampshire, New York, North Carolina, North Dakota, Ohio, Oregon, Pennsylvania, Rhode Island, South Carolina, South Dakota, Texas, Vermont, Virginia, West Virginia, and Wisconsin. There can be no question but that the purpose of legislation in American commonwealths is to enforce just dealings on the part of the railways.

Our present interest, however, centers rather in the machinery regarded as necessary to render these laws effective than in the laws themselves. The execution of a law which touches the rights and duties of citizens is usually left to the courts, but in the case of railway legislation special tribunals, called commissions, have been created. The United States at the present time seems committed to the policy of railroad commissions, and whatever Government is doing for farmers so far as railways are concerned, or, indeed, for any other class of business men, it is doing through the medium of commissions. On this account it may be well to analyze them with some care.

A commission may be roughly defined as a body of men appointed to represent Government in its dealings with railways, and to care for the public interests in all matters of controversy that may arise. There are at present thirty State railroad commissions besides the Interstate Commerce Commission, which rests for its authority upon Federal law. The jurisdiction of each of these independent bodies is strictly defined. Each State commission has to do with traffic within its own borders, while the Federal Commission exercises jurisdiction over interstate traffic. The necessity for the Interstate Commerce Commission became ap-

parent when it was judicially decided that the powers of State commissions were limited to local traffic. Federal and State commissions, therefore, must be regarded as parts of the same system of control. The form which this system has assumed may not theoretically be the most perfect, but it is the only one possible in this country, on account of the peculiar structure of the American Federal State.

A feature common to all commissions is that of periodical reports from railway corporations covering all important financial and business operations. The consideration usually urged in favor of such reports is that commissioners need the information thus secured in order to perform in an acceptable manner the functions of their office; but an equally important argument is that publicity in itself tends to conservative management on the part of railways. It would be difficult for a person who believes in a democratic form of government to overestimate the importance of publicity in the management of corporate enterprises. Many an abuse which would otherwise linger long to vex the public dissipates itself when brought into the strong light of public opinion. Great advance has been made during the last few years in the matter of railway reports. A common form of report has been adopted by the commissioners of twenty-two States, and by the Interstate Commerce Commission, thus insuring a certain degree of uniformity in the matter of keeping accounts. There now exists in this country, for the first time, a basis for sound railway statistics, for which the State and Federal railroad commissions should have full credit. There is nothing striking or brilliant about this policy of publicity, but it has within it a potential efficiency which few recognize. It should, however, in order to secure the best results, embrace, in addition to the accounts of railways, the accounts of construction companies, without which "cost of way" can never be known; of express companies, whose business is in reality that of quick-delivery freight; and of all companies and individuals owning rolling-stock or terminal facilities used by railways. The great danger is that the quietness with which the principle of publicity works will deprive it of the confidence it deserves.

Aside from the principle of publicity, which is common to them all, railroad commissions may be divided into two classes, according as they conform to the Massachusetts or to the Illinois type. The former of these may be characterized as supervisory, the latter as supervisory and regulative. Commissions of the Massachusetts type have direct and final jurisdiction over certain minor questions that arise, and are also intrusted with the control of all

technical matters which concern the safety and convenience of the public. Outside of this their duties are limited to such inspection as is necessary to determine whether the laws established by the legislature are properly observed. They are at liberty to exercise no discretion whatever respecting general questions of transportation. The reports of commissions of this class are made either to the attorney-general or to the legislature, and having rendered this report their responsibility ceases; for it lies within the discretion of the attorney-general, acting upon the information contained in the report, to proceed against any derelict corporation, and within the discretion of the legislature to enact new laws which shall provide more perfectly for the protection of the public. Arizona, Colorado, Connecticut, Kentucky, Maine, Michigan, New York, Ohio, Rhode Island, Vermont, Virginia, and Wisconsin have commissions of this type.

The Illinois Commission, on the other hand, has had conferred upon it, in addition to such general functions as are assigned to commissioners in Massachusetts, certain powers that are partly administrative and partly judicial. For example, commissions of this type are empowered to revise or alter rates, or indeed to impose schedules of rates on the railway companies. They may also regulate connections between roads, and fix terms for exchange of traffic. Besides these powers, commissions of the Illinois type are competent to hear complaints under oath, to compel the attendance of either party to a complaint, to subpoena witnesses, and in the name of the State to institute proceedings against the roads. Powers of this sort seem to be, in part at least, of a judicial character. The commissions which exercise them are somewhat new to the established principles of law, and there are a number of legal questions to be settled before their rights and powers can be strictly defined. Especially is this true of the Interstate Commerce Commission, which is patterned after the Illinois rather than the Massachusetts type. But no one can doubt that the unusual powers conferred are rendered necessary by the unusual state of affairs which the development of railways has produced, or that these commissions are asserting for themselves a permanent place in the administrative machinery of Government. The States whose commissions are adjusted, in the main, to the Illinois type are Alabama, California, Georgia, Iowa, Kansas, Minnesota, Missouri, Mississippi, Nebraska, New Hampshire, North Carolina, North Dakota, Oregon, South Dakota, South Carolina, and Texas.

Besides the States already named, Indiana, Arkansas, New Jersey, and Pennsylvania have commissions especially established for the assessment of railway taxes, and the State of Pennsylvania has made as ample provision for the collection of railway statistics as any State having a commission.

It seems proper, in showing what Government is doing to secure justice from railways to their patrons, to emphasize the importance of commissions, since this is the part of the subject usually overlooked. The truth is, there has been created in this country during the past twenty years a vast governmental organization which, if permitted to develop as experience points the way, and if supported by the enlightened sentiment of the public, will surely solve the railway problem without endangering the stability of our democratic institutions. To speak in detail of the work already accomplished by commissions would carry us beyond the limit of a magazine article. Many contested questions have been decided, a fact of importance, not only to the parties directly interested, but to the public at large, since through such decisions there is being crystallized a body of opinion touching the rights and duties of railway corporations. In the matter of charges, for example, the power of fixing, revising, or altering rates has been exercised by the Interstate Commerce Commission and by the commissions of the States of Alabama, California, Florida, Georgia, Iowa, Illinois, Kansas, Maine, Minnesota, Missouri, Mississippi, Nebraska, New Hampshire, North Carolina, North Dakota, and South Carolina. The power to regulate connections and terms of exchange of traffic between railways has been exercised by the Interstate Commerce Commission and by the commissions of the States of Alabama, Connecticut, Georgia, Iowa, Illinois, Massachusetts, Maine, Michigan, Minnesota, Mississippi, Nebraska, New Hampshire, North Dakota, South Carolina, South Dakota, and Wisconsin. As legal principles are evolved by the decisions of the courts, so the reciprocal rights and duties of those interested in the question of transportation may be evolved through the aggregation of opinions rendered by commissions. It is not more schemes or plans for the solution of the railway problem that are desired, but a more careful study and a more conscientious application of the plan to which the country has committed itself. It should not be forgotten that any great social or industrial question ceases to be a question when the people of the country come to think clearly respecting it.

Henry C. Adams.

“WHEN FROM THE TENSE CHORDS OF THAT MIGHTY LYRE.”

I

WHEN from the tense chords of that mighty lyre
The Master's hand, relaxing, falls away,
And those rich strings are silent for all time,
Then shall Love pine, and Passion lack her fire,
And Faith seem voiceless. Man to man shall say,
“Dead is the last of England's Lords of Rhyme.”

II

Yet — stay! there 's one, a later-laureled brow,
With purple blood of poets in his veins;
Him has the Muse claimed; him might Marlowe own;
Greek Sappho's son! — men's praises seek him now.
Happy the realm where one such voice remains!
His the dropt wreath and the unenvied throne.

III

The wreath the world gives, not the mimic wreath
That chance might make the gift of king or queen.
O finder of undreamed-of harmonies!
Since Shelley's lips were hushed by envious Death,
What lyric voice so sweet as this has been
Blown to us on the winds from over seas?

Thomas Bailey Aldrich.

AN ACQUAINTANCE WITH HANS CHRISTIAN ANDERSEN.

I.

HANS CHRISTIAN ANDERSEN has been dead for seventeen years, but his fame shows a vitality which suffers no diminution with the lapse of time. It is born anew with every fresh generation of children, and it is cherished by adults with the tenderness which clings to every memory of childhood. His "Wonder Stories" are the only books belonging to the pinafore period which are not discarded with advancing years; nay, which gain a new significance with maturing age. We read "The Ugly Duckling" with the same delight at thirty that we did at ten; for we discover a new substratum of meaning which escaped our infantine eyes. "The Emperor's New Clothes," which fascinates a child by the mere absurdity of its principal situation, recalls to the adult a charming bit of satire for which he finds daily application in his own experience. The novel "The Improvisatore," though it is fifty-seven years since it was written, is yet exhibited in the booksellers' windows on the Piazza di Spagna side by side with the latest Parisian successes; it is found in the satchels of nearly every tourist who crosses the Alps; and it was republished a few years ago, in a complete set of its author's works, by a well-known Boston publishing house. Father Time, as we all know, is the author's worst enemy; and an author who, though dead, can make such a vigorous fight against the ruthless old iconoclast has evidently the stuff in him for a long post-mortem career. He may be said to have made a successful launch toward immortality.

I had the good fortune to make Hans Christian Andersen's acquaintance in 1873, during a three weeks' sojourn in Copenhagen.

The Danish poet Vilhelm Bergsøe was my cicerone, and kindly furnished me with introductions to his literary friends. He told me a charming story of Andersen, just as we were on our way to the latter's dwelling. Mr. Bergsøe, it appeared, had some years ago been blind, and, after an operation had been performed on his eyes, had been obliged to spend several weeks at a hospital in a dark room. Time hung heavily on his hands, and his solitude was made doubly oppressive by his inability to read or to engage in any kind of occupation. One

morning there was a knock at the door, and a man whose face was invisible on account of the dark walked up to his bedside.

"I am Hans Christian Andersen," the stranger said, pressing the invalid's hand. "I was told that you were ill; I too have been ill, and I know what it is. Let me sit down and keep you company; I will, if you like, tell you some of my stories."

This was only the first of a long series of visits which Andersen made to the hospital during Mr. Bergsøe's slow and tedious convalescence. He told amusing incidents from his life, or pathetic ones, according as his mood varied, and occasionally he recited from memory his own poems and tales. The tenderness of his nature, and the gentle and child-like simplicity of heart for which he has been both praised and ridiculed, were vividly revealed to his listener in these improvised entertainments, and Mr. Bergsøe has never ceased to have a high regard for "the children's poet" since those happy hours in the dark.

It was about eight o'clock in the evening when we ascended the stairs to Andersen's lodgings. He had two old maids to keep house for him, and one of these obligingly opened the door. In the front room, into which we were ushered, was a portrait bust of the poet, standing on a pedestal, and round about were scattered a great number of blooming plants in flower-pots. The room, which served for parlor and reception-room, was plainly but comfortably furnished. The door to the inner chamber was presently opened, and a voice called to us to enter. We found Andersen's long and lank figure lying upon a sofa wrapped in a flowered dressing-gown.

"Ah, indeed. You come from America," he said, half rising from his pillow as Mr. Bergsøe presented me. "That is a long way off; but distance is nothing nowadays. I have many friends in America. Do you know Horatz Scooder?"

"Horatz Scooder," I repeated, trying vainly to recall the association of that name. "No; I do not know him."

"But you must have heard of him, surely," Andersen insisted. "I have been told that he is a very distinguished man of letters."

"He may be distinguished, but not as a man of letters," I replied; "for I know, at least by name, every author of any consequence in

the United States, and I never heard of Horatz Scudder."

"That is indeed singular," my host continued, with a puzzled face. "I have been told that his books are charming and popular. He translated my *"Wonder Stories"* into English."

"Ah, you mean Horace Scudder," I exclaimed, laughing. "Yes; he is a well-known man of letters, and I have the pleasure of his acquaintance."

Andersen seemed to be greatly relieved to know that the translator of his works had valid claims to distinction; though, if Fame were to undertake to mispronounce his name as badly as Andersen did, I fear Mr. Scudder would be unable to identify his own reputation.

"I wish you would tell me something about life in America," Andersen went on, after a little chat with Mr. Bergsøe about a common friend; "I dare say I am very ignorant. I have laid the scenes of my *"Wonder Stories"* almost everywhere in Europe and Africa and Asia; but of America I don't know enough to make even a fairly conduct herself there with propriety."

"If you would come over, I should be pleased to act as your cicerone," I answered, "though there would be a great many who would contest that honor with me."

"Oh, yes," he said; "if you could telegraph me over, I should be pleased to go. But I am a poor sailor, and am always ill on the ocean. But you must take my greeting with you to my friends in America, and, if you write anything about me, you must give my love to all the American children who read my books, and tell them I am sorry that I am too old and feeble to go to see them."

I declared my willingness to forward this message, and Andersen, after a moment's thought, continued:

"It is very strange that America should appear so incomprehensible to me. It may be because I got my first impression of the country from Cooper's novels, and nothing that I have read since has been able to displace that first impression. In the moon (you know the moon is an old friend of mine) I can imagine all sorts of delightful things happening, but in that great land of harsh prose where you come from, I should think a poetic imagination would starve to death for want of material or for want of recognition."

I endeavored to refute this assumption, and the conversation grew general. At the end of half an hour we took our leave, and Andersen, rising with difficulty, pressed my hand and said: "If you will come to see a sick old man, I need not tell you that you will be very welcome. I am a great deal alone, and I should like very much to chat with you, when you have nothing better to do."

II.

A FEW days later, when I availed myself of the poet's invitation to call, I found him, as at our first meeting, lying on the sofa wrapped in a dressing-gown. He was pale and emaciated; but his face seemed ennobled by suffering, and had lost the plebeian look which is characteristic of all the portraits taken during the earlier periods of his life. The large receding forehead, which was spacious and of good proportions, was the only feature which gave any indication of intellect; the nose, mouth, and chin were rudely modeled, almost ugly.

The grayish blue eyes were full of kindness; but they were small, and could never have been luminous. The whole figure was loose-jointed and angular, and the arms and legs seemed too long in proportion to the trunk.

It was evening when I called, and a lamp, heavily shaded and placed behind a screen, lighted the room dimly.

"Ah, it is my American friend," was Andersen's greeting as I entered; "it is very kind of you to come back to me so soon."

He pressed my hands almost affectionately, and begged me to be seated.

"I have thought a great deal about America," he began, "since I saw you last. I have a great deal of time for thought now, because I can do nothing else. Is it true that the streets in New York are so crowded with wagons and trucks that you cross them only at the peril of your life?"

"Broadway," I replied, "is at certain times of the day, and at certain street-crossings, so crowded that ladies would not venture to cross without the escort of a policeman."

"Is it possible!" he exclaimed in childlike delight. "That is certainly amusing. I should like to see that very much — fine ladies conducted across the street by policemen. If I had known that a few years ago I should certainly have used it in a story."

He threw himself back on the sofa, and laughed heartily.

"There must be something colossal about life over there," he ejaculated with unwonted animation. "I am afraid it would not suit me. I should be bewildered by the din, lose my wits, and be run over. How did you ever get accustomed to it?"

"In the little university town where I live," I replied, "it is as quiet as it is in Copenhagen."

"Ah, indeed, yes. I did not think of that. But how do people conduct themselves over there? Are they not very hard and unfeeling, having regard for money and for nothing else?"

"I know that notion is very prevalent here; but though Americans have great regard for

money, they are far from being what you take them to be. In daily intercourse they are to me quite as congenial as my own countrymen."

"I am pleased to hear that. But you can not deny that they have shown themselves very unfeeling toward the poor Indians. I think it is quite shocking. I assure you, I wept when I read in a German paper how the American Congress had broken all their treaties, and driven the poor red man ever farther westward, until soon he who once owned the whole magnificent continent will not have a foot of ground he can call his own."

As I am not writing about myself, but about Andersen, I shall not reproduce my special plea in the case of *The White Man versus The Red Man*. We had a very animated discussion; and Andersen, who scarcely knew by name the pitiless doctrine of the survival of the fittest, grew quite alarmed at the novelty of the theory which I advanced. He had heard of Darwin, and took him to be a very absurd and insignificant crank who believed that he was descended from a monkey. It surprised him to hear me speak of him with respect as the greatest naturalist of the age.

"Oh, it is very sad," he said, with a naïveté which laid bare his simple, childlike, soul, "that men cannot be satisfied with what God has taught them, but must question his word as if they knew better than he. Useful inventions which make life easier and happier, those I approve of with all my heart, and to them the scientists ought to confine their labors. But when they come to me and want to deprive me of my faith in God and his word, then, I say to them, 'Excuse me, gentlemen, I know as much about this as you do, and cannot accept you as guides.'"

I did not choose to take up the cudgels for Darwin just then, because I much preferred to have Andersen talk about things concerning which he had a more definite knowledge. The subject was therefore allowed to lapse, and after a moment's pause my host began to question me about my route of travel and my plans for the future. "I wish I could give you some letters," he said, as I referred to my intention of going to Paris; "but my Parisian friends are either dead or so old that you scarcely would care to see them. Victor Hugo, to be sure, is still vigorous; but my acquaintance with him is only slight. Alexandre Dumas is dead. I shall never forget his great woolly head and his irrepressible jollity."

"I believe you tell a story of your first meeting with him in your autobiography," I remarked.

"Yes; I told as much of it as I dared to tell," he replied. "But there is more of it, and, if you like, I will tell you what I left out."

On my urging him to supply the suppressed details, he laughed gently to himself, and continued:

"It was during my second visit to Paris in 1842 that I met Dumas. Whenever I called I was told that he was not up yet, until I concluded that he spent the whole day in bed. I knew, however, that he could not be sleeping; for he was publishing at the rate of two or three romances and plays a month, and they all showed the stamp of his luxurious imagination. I know it has been proved in court that he did not actually write all of them; but he at least plotted them and supervised the writing. He lived in very grand style when I went to see him, and they said he was a great gormand, who prided himself more on a salad he had invented than on 'The Count of Monte Cristo.' I was very anxious to see him, as I had a letter of introduction, and all Paris was talking about him. At last, when I had called half a dozen times in vain, being always told that he was in bed, I sent up my letter and determined to wait until he should get up. After a while the servant returned and asked me to accompany him to M. Dumas's bedroom. It was a splendidly furnished room, but in great disorder. As I entered, Dumas looked up, nodded kindly to me, and said: 'Sit down a minute; I am just having a visit from a lady'; and, seeing my astonishment, he burst into a hearty laugh, and added: 'It is my Muse. She will be going directly.'

"He was sitting up in bed as he said this, writing at lightning speed, in a clear, beautiful hand, and shying each sheet, as he finished it, across the floor in all directions. I could scarcely step for fear of spoiling his manuscript. I waited for ten or fifteen minutes, during which he kept scratching away, crying out every now and then, 'Viva! Bon, mon garçon!' 'Excellent, Alexandre!' At last, with a jerk, as of an earthquake, he rolled his huge form out of bed, wrapped the blanket about him, toga-fashion, and in this costume advanced toward me, declaiming furiously at the top of his voice. As he strode along with theatrical gestures I fell back, half alarmed at his vehemence; and when I had reached the door he seized me by the lapels of my coat, shook me gently, and said, 'Now is n't that magnificent, eh? Superb; worthy of Racine!' I assented, as soon as I could catch my breath, that it was very magnificent. 'It's my new play,' he said. 'I write an act, and often more, before breakfast. This is the third act I have just finished.'

"Another time I called upon him; he was living in the *Hôtel des Princes* in Rue Richelieu. He asked if I would not like to become acquainted with the celebrities of Paris. I an-

swered that I had the honor of knowing Victor Hugo already.

"'Victor Hugo,' he interrupted me; 'oh, yes; he is well enough, but he is no great celebrity. No; come along with me, and I will show you celebrities who are better worth knowing.' I thanked him very much, and declared myself ready to go with him. To my surprise he took me to the greenroom of the Théâtre Saint-Martin. They were giving a ballet, and we found ourselves in a throng of ladies dressed in tricot and gauze petticoats. I assure you, I was very much embarrassed; but Dumas was not in the least abashed. I would have made my escape, but Dumas seized me by the arm and introduced me to two fairies with whom he was talking. I saw from the way they looked at me that Dumas had been talking to them about me. I feared they were making sport of me, and it hurt me very much. As I retired a second time, Dumas came after me, laughing merrily.

"'No skulking, my lad,' he said; 'come back and make yourself agreeable.'

"I assured him I did not know French enough to be agreeable to ladies.

"'Oh, never mind that,' he insisted; but I saw plainly enough that he was making merry at my expense, and I bade him good-evening.

"'Well,' he said, as he shook my hand at parting, 'how do you like our celebrities?'

"As he was about to return to the greenroom he suddenly changed his mind, took my arm, and invited me to dine with him at his hôtel. He seemed to feel sorry that he had offended me, and ever afterward he was one of my kindest friends in Paris. On the boulevards we met a young man who resembled Dumas somewhat, though he was much handsomer.

"'That is my son,' said the elder Dumas, as he stopped and introduced the young man, who has since become so famous."

III.

THE last time I called upon Andersen he had just received a visit from some lofty personage,—a member of some royal family, if I remember rightly,—and he could talk of nothing but the gracious condescension and kindness of the duke or prince. He was less interesting to me than he had been on previous occasions, because his excessive humility seemed unbecoming in a man who by dint of genius had risen from the lowest origin to a world-wide fame. We conversed for a while about royalty in general, and he had kind words and admiration for every rogue who sat or had sat upon a throne. They had all been unjustly maligned by those dreadful people, the socialists and republicans, who had the

cruelty continually to harass and wound the feelings of the good and noble kings. He told me how kind King So-and-so and Duke So-and-so had been to him, how they had granted him a pension, given him presents, and admired his writings.

"If you will pull out the top drawer in the bureau there, you will find a ring which her Majesty Queen Caroline Amelia graciously gave to me as a souvenir of our voyage to the island of Föhr."

I went to the bureau, and after some searching among a number of similar souvenirs found the ring. He evidently expected me to regard it with reverent interest, and he seemed disappointed at my lack of enthusiasm. I endeavored to be sympathetic and not to display the cloven foot of democratic sentiment, which would at once have put an end to his friendship for me.

"In the left-hand corner of the same drawer," he went on, after I had duly inspected the precious ring, "you will find a little case containing the Order of the Red Eagle of the Third Class, which his Majesty King Friedrich Wilhelm IV. of Prussia graciously bestowed upon me in commemoration of the happy evening when I read 'The Swineherd' and 'The Ugly Duckling' to their Majesties at the Palace in Potsdam."

I handed him the box containing the order, and he opened it and gazed upon it with eyes full of childlike delight. I endeavored to do the same, but with ill success.

"He was a noble and highly cultivated man, the King of Prussia," he said, as he took the order from its case and invited me to admire it. "He had a gracious and affable manner which won all hearts. He had a great deal of *esprit* too, and frequently said witty things."

"Heine says that he was much addicted to the bottle," I remarked lightly.

"Heine was a mocking, irreverent spirit," Andersen replied warmly. "Nothing was sacred to him—not even God himself. How could you then expect that he would have reverence for his king?"

"I know," he continued after a pause, "that it is the fashion nowadays to malign the memory of departed kings. Friedrich Wilhelm had his failings, no doubt, but no one can make me believe that he was not a great and noble man. His bearing was so kingly, his condescension so kind and spontaneous, and goodness of heart shone out of his eyes when he spoke to me. If his brother, the present king, had had as kind a heart, we should not have lost Sleswick-Holstein."

For more than an hour Andersen entertained me with stories and anecdotes connected with his souvenirs of celebrated people. He had a

great variety of things, and each object recalled some pleasant incident in his own career or in that of the giver. He grew eloquent and animated. He showed me a large screen which had been gotten up for a church fair in England, to be put up at lottery for some charitable purpose. It was embroidered (in colored silks, if my memory does not deceive me) by the ladies of the congregation, and represented a dozen or more scenes from Andersen's "Wonder Stories." The winner had sent it to the author of the tales.

The conversation then turned upon his writings, and I told him how his stories had been the dearest books of my childhood, and seemed associated with all that was delightful in the memory of it. I told him how happy and flattered I had felt at finding the name of the little boy in "Ole Shut-Eye" the same as my own, and that half unconsciously I had appropriated his experiences and half believed them to be my own.

This little confession seemed to touch An-

dersen strangely. Tears filled his eyes; he seized both my hands, and pressed them warmly.

"Now you understand," he said, "what a happy lot it is to be the children's poet."

I rose to take my leave, but lingered talking; and on my expressing a desire to hear him read, he half rose upon his sofa, adjusted his pillows, and began to recite from memory "The Ugly Duckling."

His manner was easy and conversational, full of caressing inflections, such as one employs in telling a tale to a child. In the pathetic passages he was visibly affected, and he closed almost solemnly.

"It is the story of my own life," he said. "I was myself the despised swan in the poultry-yard, the poet in the house of the Philistines." I felt suddenly, as he finished his recital, that I understood the man. I had caught the keynote of his character. All that was good and noble in him rose in vivid light before me. I never saw him again.

Hjalmar H. Boyesen.

TOPICS OF THE TIME.

The Louisiana Lottery a National Infamy.

A MONTH ago we asked our readers to reflect on "The Degradation of a State," as revealed in the history of the Louisiana State Lottery. It was shown, on the testimony of the originators of the Lottery, that its charter was obtained and maintained by wholesale bribery and corruption; that this meanest and most pernicious form of public swindling was fastened upon Louisiana and the country in general by a gang of New York lottery-dealers and racing-men; that those gamblers were, in their own words, the conductors of a "business reprobated by law and contrary to public policy and good morals"; that, in effect, Louisiana has licensed a gambling corporation to break the laws of all the other States of the Union, and to plunder their citizens of millions of dollars annually; and that Louisiana herself has been a sufferer, not only by the impoverishment of her working-classes, but by the moral degeneracy of rich and poor alike, and by the subversion of the most sacred duties of State government.

For twenty-four years this giant parasite, this vile contagion, has been nourished by Louisiana for the sake of a paltry \$40,000 a year, which is only a fraction of the hundreds of thousands enticed annually from her own people; for twenty-four years it has fattened on the whole country, thanks to the venal cunning of its managers, and the blindness or indifference of the guardians of the laws, and even of the people themselves. Never before has one State of the Union so prostituted her authority to her own reproach and to the injury of her sister States; and never before has the general public been so apathetic toward such imposition, such infection, such robbery. A point has been reached where the existence of the Louisiana Lottery is not merely the degradation of a State; it is a national infamy.

Eighteen months ago, Congress tardily took effective measures to deprive the Lottery of the free use of the mails. This was attained only by giving other Federal courts than those of Louisiana jurisdiction over lottery infractions of the postal laws. But this salutary measure has only impaired the power of the monster by adding to its running expenses and by curtailing its advertising. Newspapers containing its advertisements may no longer be sent through the mails. This has given its organs a text for complaint on the score of infringing the liberty of the press; and with the aid of some of the most noted and respectable lawyers of the country, ostensibly in the interest of the newspapers, an attack is being made on the constitutionality of the law. Even if the law is upheld by the Supreme Court, the Lottery will get along very well, as at present, with the aid of the express companies, which in some ways are almost as far-reaching as the mails; and in case the expresses are prevented from serving the Lottery, it will still be possible to carry on the business by private messengers to all the large cities.

It has been suggested that a national tax, so large as to be prohibitory, on each lottery ticket sold, would be an effective measure of suppression. Congressman Little of New York has in fact, introduced a bill to this end, which ought to be made a law before the Louisiana election in April, partly for the moral effect it would have in that contest. The bill is skillfully drawn as to methods and penalties, which, with the great inducement offered to informers, would render concealment hazardous; yet the margin of profit is so enormous that the managers could lose three fourths of their plunder and still chuckle. When it is a fact that a million to a million and a half worth of lottery tickets are now sold monthly in States where the business has to be conducted by stealth, it will be possible,

clearly, for the Lottery to supply its subterraneous channels from secret suboffices. It would be as easy and as respectable as the distribution of counterfeit money, with this advantage—that while the lottery tickets are really worth little more than “green goods,” they are accepted for “face value received” by the dupes who buy them. So, while under the action of such a law the profits would be smaller, “the swindle would be sure” and still yield a handsome maintenance in case the Lottery could protect itself against informers.

The upshot of all repressive legislation, except, perhaps, in the form of Mr. Little's bill, will be that so long as the Lottery has the refuge and ownership of a State, where distinguished generals may preside in mock dignity over drawings conducted in apparent honesty, the Lottery will snarl at Federal postal laws and the prohibitory laws of other States, and will still enjoy the wages of our national infamy.

Strange as it may seem to citizens of other States who are not thieves at large, or already in prison, Louisiana is believed to be at the point of yielding herself for another twenty-five years to this swindling nuisance. Up to this time the State has had only a nominal bribe of \$40,000 a year, more as an amiable excuse for her purchasable legislators than as a reward for her services; but now what appears to be a majority of her influential citizens are eager to make her a full partner in the crime against her sister States, with a minor share of the profits.

Many otherwise good people of Louisiana have grown so fond of the stench of Lottery money that they doubt if the State could exist without its morsel of the carrion. The Lottery's offer to pay annually \$1,250,000, almost the present State levy for taxes, is talked of as “a revenue measure,” when it is a scheme to farm out the taxes and the responsibility of government to a ruthless corporation, with power to filch four or forty dollars from the people of Louisiana for every one it turns into the treasury. Through self-deception, bribery, and personal interest this proposition has taken the form of a constitutional amendment recommended by two thirds of the State legislature, and, though irregular in its origin, has been accredited by a majority of the Supreme Court of the State. One of the justices of that court, ex-Governor McEnery, disguised as a half-lottery man in sentiment, has become the candidate for governor of the Lottery party, who hope to elect him and carry their measure in April. Every motive and every act of the pro-lottery people is under one disguise or another.

When otherwise respectable citizens are in open apology and support for an institution like the Lottery, shall we wonder at the barefaced effrontery of the Lottery owners? One of the minor stockholders was a passenger on an ocean steamship during the summer. In a smoking-room talk he had discoursed sweetly of religion, and had maintained the poise of an honest man until the conversation drifted into the channels of investment; then he could not help bragging of the wonderful dividends earned by some Lottery stock in his possession, until a justice of the supreme bench of Missouri, who was in the circle, boiled over with indignation, and shut him up with the exclamation: “Sir, in our State we treat the sellers of your lottery tickets as we treat horse-thieves.”

But it is the chief beneficiary of the Lottery, the man

who figures in the new bill as sponsor for the \$1,250,000 bribe to the State, who is most to be admired for cool assurance in this business. He has made millions of money out of the Lottery; he has seen political parties, political bosses, governors, legislators, and judges bend to his behests; he has felt the lick of a people degraded by the Lottery on the palms of his alms-giving hands; though a citizen of New York, he is now enjoying an office higher than that of the Governor of Louisiana, who is a mere creature of the constitution of that State,—for he is a part of the constitution itself, the maker and maintainer of government. Why should he not aspire to twenty-five years more of such omnipotence, and seal his ownership with nearly the full maintenance of the State? If Louisiana accepts this new degradation, how much longer will the other States accept their attendant infamy?

To be sure, there is a ray of hope that the anti-lottery party, which is a sudden growth among the best Democrats of Louisiana, aided by the Farmers' Alliance and by a section of the Republican party, may defeat the Lottery bill even if it does not elect its own candidate for governor. Tremendous will and energy are enlisted to that end, though the money resources are meager. If the Democrats of other States ever mean to resent the Louisiana outrage on their rights, they can never again do it so cheaply and so effectively as now, by carrying aid to Governor Nicholls, Senator Murphy J. Foster, and their earnest colleagues. If the Republicans of the other States hold public honor above party advantage, they will send strong appeals to the colored Republicans of Louisiana to turn deaf ears as regards the Lottery bill to some of their leaders who are, and always have been, Lottery owners and supporters. And if Congress means ever to act by a tax measure, then let Congress act with double force by the immediate passage of such a law.

But the Lottery's agents are in Congress as well as out of it; its money lurks in the coffers of State and national committees of both parties. Heaven only knows how well and for how long we have been trained to endure this national infamy.

Columbia College.

WHEN Mr. Seth Low was installed as president of Columbia College two years ago, we said that “those who have pondered on the needs of New York have dreamed of a time—which Mr. Low can, and we believe will, do much to hasten—when Columbia College will be the center, and our various museums, libraries, and other institutions more or less formal and official parts, of ‘the great metropolitan university.’” In the two years which have passed, the new president has accomplished much at Columbia, internally and externally. He has reorganized the administration of the various schools which make up Columbia, so that each school in a measure manages its own affairs, while the affairs of the college as a whole are managed by the University Council, consisting of delegates from every school. He has taken over the College of Physicians and Surgeons and made it an integral part of Columbia—an act of great importance to the future of medical education in the United States. He has rearranged the work of the senior year so that the student may begin his professional studies in the technical schools without surren-

during his connection with his fellow undergraduates. He has begun to ally Columbia with the other educational institutions of New York; the students of the theological seminaries are now admitted to certain lectures of Columbia; and Dr. Osborn, the head of the new Department of Biology, has also been appointed Curator of Mammalian Paleontology at the American Museum of Natural History. Thus we see Columbia extending one hand to religion and the other to science. Thus we see Columbia seeking to coördinate, if not to consolidate, the influences which make for the intellectual life in this great city, giving them a center, a focus, a rallying-point.

The trustees of the college—to whom we owe the choice of Mr. Low as president, a distinct accession to the citizenship of New York—have been liberal in throwing open to the public those college lectures at which the presence of strangers would not interfere with the work of the students. They have in contemplation courses of lectures, to be delivered probably at Cooper Union, intended for "the plain people"—to use Lincoln's phrase—and chiefly on those subjects wherein the need of instruction is greatest in our polyglot and cosmopolitan city, the science of government, political history, economics, and sociology. They have invited Mr. E. C. Stedman to deliver, under the auspices of Columbia, his course of lectures on Poetry. They have been strengthening the teaching staff unceasingly, having within a year called Dr. Osborn from Princeton, Mr. Cohn from Harvard, Mr. J. B. Moore from the Department of State at Washington, and Mr. George E. Woodberry from his library. They have done much to make Columbia a really great metropolitan university—for there is no reason why New York should not have as great a university as Paris, Vienna, and Berlin.

Now the time has come when the citizens of New York must do something for the college. Columbia has shown its desire and its ability to identify itself with all that is best in the life of the city, and the people of the metropolis must now do something to help Columbia to a sphere of greater usefulness. The single block of buildings at Madison Avenue and Forty-ninth street is no longer large enough for the many workers who are thronging there. The space which was ample for the little college of 1863 is wholly inadequate to the great university of 1892. So the trustees have secured an option on a part of the land now occupied by the Bloomingdale Asylum. This new site for the old college is two and a half times as large as Madison Square; it is set on the heights near the new cathedral, between the Riverside Drive and Morning-side Park, a situation of exceptional beauty and of unexceptionable fitness for the purpose. Here Columbia can spread out; here its schools can expand and multiply; here there will be space enough for a proper campus whereon the sports dear to the student's heart may be played comfortably; here will be room for dormitories—if it should be decided to add these aids to the compact cohesion of the undergraduates.

The advantages of this removal, of this opportunity for development, are indisputable—the advantages to the college and to the city. But if this removal is to take place, if this development is to be brought about, the citizens of New York must lend a helping hand. Columbia is not rich, despite the popular belief to the

contrary. Considering the work which the college is called upon to do, Columbia is poor. To make the move will cost money—for the land itself, for the library, for laboratories, for lecture-halls. Who will help? Whether New York shall have a great metropolitan university worthy of this great city now depends in a measure upon the response which its public-spirited inhabitants make to the statement of Columbia's desires, possibilities, and needs.

A Columbian Fair Memorial Building.

No more worthy proposition has been made in connection with the Columbian Exposition than that for the erection at Chicago of a permanent memorial of it in the form of a great museum. The establishment of such memorials has long been recognized as one of the most valuable concomitants of international fairs, and it would have been very surprising if Chicago, with her redundant and admirable public spirit, had not perceived her opportunity very soon after the Columbian Exhibition was organized. The project was in fact broached at the very outset, and played a considerable part in the discussions over a site. When the directory decided to go to the lake front, it decided also that it could not use any of the funds at its disposal for a memorial building. This threw the proposal upon public favor for support, and efforts were at once begun to enlist popular interest in its behalf.

The most zealous advocate of it from the outset has been Mr. W. T. Baker, the president of the World's Columbian Exposition (called the local board), and president as well of the Chicago Board of Trade. He has been warmly seconded in all his labors by Dr. W. R. Harper, president of the University of Chicago, and the two together have formulated a plan which has such obvious merits that public support of it ought to be quick and generous.

In brief, this plan is to construct, on grounds secured for the purpose, a magnificent fireproof building, especially adapted for its purposes, into which could be gathered, at the close of the Exposition, such antiquities and articles of historical value as the Fair had brought together, the same to be made the nucleus of a great museum for the education of the people for all time. It is believed by the promoters of the Fair that its residuum will be richer and more varied than that of any of its predecessors, especially so in reference to collections from the American continents, since the countries of Central and South America will be more completely and generally represented than they have ever been before.

In order that the best intelligence may be brought to bear upon the museum and its collections from the very beginning, it is proposed to have it started in connection with the new University of Chicago, and to have it conducted in connection with it, but not under its absolute control. This is an excellent idea, and ought to stimulate interest in the plan and at the same time encourage contributions; for the association of the university authorities is a sufficient guarantee that the work will be carried forward on lines of the highest artistic and educational value. President Harper showed his eminent fitness for this service in a speech which he made in support of the project when it was laid formally before the people of Chicago a few months

ago. He declared then that the opportunity of a lifetime had come to Chicago, and that if it were improved properly, the outcome would be a museum which would do for Chicago what the British Museum has done for England and the Smithsonian Institution has done for America. The first and most important work of universities, he contended, was that of research, the discovery of new facts, the deduction of new ideas from old facts; the universities of America were behind the great ones of Europe, chiefly because of the lack of libraries and museums; Chicago owed it to herself to provide, in addition to the libraries which she was supplying, a great museum which should furnish the equipment for research and investigation needed for the advancement of education; the establishment of such a museum would be a lasting benefit not only to Chicago, but to the people of neighboring cities and States.

This is a forcible and cogent statement of the case. The plan is simply one for the advancement of education and enlightenment throughout the whole Northwest. The influence of a great museum of the character described is limited only by the country itself. We need one in every group of half-dozen States at most, and if we were to have one in every State, the supply would be none too large, provided the material for their equipment could be found.

Mr. Baker proposes a total expenditure of \$1,000,000 for the building, and declares that if this were furnished, there would be forthcoming contributions of specimens and articles of historic interest aggregating \$3,000,000 in value. The whole State of Illinois ought to unite in subscribing the million desired, for the museum will be an incalculable benefit to the State as well as one of its proudest possessions. Philadelphia rejoices today in the possession of two beautiful memorials of her Exposition—Horticultural Hall and Memorial Hall, both situated in Fairmount Park, and both containing collections which are among the largest and finest of their kind in the country. Nothing would induce her to part with these, to have their beneficent influence eliminated from the community. The city and State contributed through large appropriations to the erection

of these institutions, nearly two millions of dollars going into the construction of them, but the outlay has never been regretted. It will be all the greater honor to Chicago and Illinois if they can erect their memorial by private aid alone.

National Justice to Postal Clerks.

THE bill for the classification of clerks in first and second class post-offices, which Congress is considering, ought to become a law without opposition. It was prepared by the National Association of Post-office Clerks, and is a measure conceived and designed for the sole purpose of securing just and fair treatment to a very hard-working and meritorious body of public servants. It fixes their compensation upon an equitable and reasonable basis, insures promotion according to service and ability, and makes faithfulness and efficiency the sole requisites for permanent employment. It is a measure in the interest of true civil-service reform, as well as national justice, since it classifies the service, makes it mandatory that all appointments to the higher grades shall be from the lower grades, on the ground of proficiency and length of service, and requires that all new appointments shall be to the lower grades after competitive examinations as required by the Civil Service Act.

Under the present system, or rather lack of system, the clerks have no classification which insures promotion according to service and ability, have long hours of labor, are poorly paid, and have no annual vacation. To say that a great and rich government like ours is justified in treating its employees in this heartless, unfair, and parsimonious manner is obviously absurd. A private employer who pursued such a course would be censured roundly by all reputable men. As a nation we are abundantly able to pay our servants fair wages, and we ought to see that it is for the best interest of the whole public to have our post-office clerks a permanent, well-drilled, intelligent, capable, and contented body of servants, for it is only from such a body that the best service can be obtained.

OPEN LETTERS.

The Numerical Strength of the Confederate Army.

THE total number of men who served in the Confederate army in the late war has never been ascertained. The number cannot be ascertained exactly, and perhaps cannot be very closely approximated. But there are certain evidentiary facts which have an obvious and important bearing upon the subject, but which, it appears, have not been duly weighed or understood by historians of the war.

The numerical strength of an army ought to be ascertainable in one way—that is, by enumerating the names borne upon its muster-rolls, provided, of course, that such rolls are complete and true; but if they are not, then the actual strength of such army cannot be exactly determined.

Let us refer, by way of illustration, to the Federal army rolls. Probably the rolls of a great army were never more accurate or complete. Various facts might

be cited in proof of this assertion. It will suffice to state that in the repeated inspection of these rolls from day to day in the War Department, during the whole period since the war, in order to furnish evidence to the Commissioner of Pensions relative to the claims filed in his bureau, it is of the rarest occurrence—in fact, it may be said that it is unknown and unheard of—that such rolls are ever found to omit the name of any person who served in that army. It will be perceived that this is a thorough and conclusive test. About twelve hundred thousand claims for pension have been filed since 1861. The report furnished to the Commissioner by the War Department from its records is conclusive in determining whether a claimant, or his or her deceased relative, actually served in the army of the United States in the late war. No testimony except the record is admissible. Since, therefore, in 1,200,000 claims, filed from every State and Territory, there is never a complaint upon the ground of omission of a

name from the records, it must be taken as infallible evidence that those records are correct and true. And such, beyond doubt, is the fact. The records are of course found in some cases to be meager or deficient in respect to casualties, or other facts in a soldier's history; but in preserving the *names* of those who served at one time or another, the muster-rolls have been found and demonstrated to be practically perfect, omitting the name of no man who ever served, even for a day, as a soldier in the Federal army. If this sweeping statement is subject to any rare exceptions, they are so few that they do not require to be taken into account.

It was therefore easy to determine from these rolls that the total number of *enrolments* in the Federal army for the war (counting all enlistments for short and long periods of service, and all reenlistments) was 2,672,341. This, however, is largely in excess of the total number of Federal soldiers, since a considerable percentage served under two or more terms of enlistment, so that their names are duplicated on the rolls. The terms of enlistment were for three, six, nine, and twelve months, two and three years; and many were enrolled as often as three or four times. Making allowance for the large number of reenlistments, and counting each soldier but once, it is estimated that the total number of men who served in the Federal army from first to last was about 2,200,000.

These references to the Federal rolls are made by way of illustration, and because of the contrast existing between them and the rolls of the Confederate army.

The original muster-rolls of the Confederate army, so far as they are preserved, are in the Confederate Archives Office of the War Department, having been captured with the other official records of the Confederate government at the fall of Richmond. There has never been occasion or necessity to examine these Confederate rolls in the transaction of the public business, as has been the case with respect to the Federal rolls. So far as I can learn, no officer of the War Department or other person has ever been charged with the official duty of enumerating the names upon these rolls to determine their aggregate number, and no such enumeration has ever been made. No official or other test has been applied to such rolls, to determine whether they are true and complete. The Government is publishing the "Rebellion Records," a numerous and valuable series of volumes, which will embrace the official military reports and records of both armies; the purpose being to publish the naked official records without addition or comment. But this publication will of course not contain the muster-rolls,—the mere names of the men of either army,—and therefore will not necessitate the examination of such rolls. Furthermore, the Confederate rolls were never published in any Southern State during the war; whereas, on the contrary, the Federal rolls were published in every Northern State.

While we therefore have abundant and accurate information concerning the Federal rolls and numbers, there is a corresponding dearth of information or data relative to the rolls or the true numerical strength of the Confederate army.

In North Carolina, and in some other Southern States, recent efforts have been made to compile and publish rosters of the troops furnished by such States to the Confederate army. These efforts have thrown a great

deal of light upon the subject, and have disclosed deficiencies in the rolls which are very surprising.

North Carolina is the only Southern State in which there has yet been published anything approaching a complete roster of Confederate troops. The roster in that State was published in 1882, in pursuance of an act of the State legislature, which designated Major John W. Moore, late of the 3d North Carolina Battalion, to compile and publish the same. Finding no complete rolls at the capitol, Major Moore visited Washington, and, by permission of the Secretary of War, transcribed the names from the captured rolls, and published them in four volumes. In his preface to the first volume he announces as his estimate that the State furnished to the Confederate army 150,000 troops. But his four volumes show only 104,498 names. In the preface to his last volume he revises his estimate, which he says was originally too high; but he declares his opinion that the muster-rolls omit the names of not less than twenty thousand North Carolinians who served in the Confederate army, an estimate which indicates a total of 125,000 for that State. These two official estimates, which differ by twenty-five thousand,—one of which may, perhaps, be received with as much confidence as the other,—should suffice to show the extremely dubious value of such rolls as evidence of the true strength of the Confederate army. Major Moore's statements regarding the deficiencies in the rolls are made from personal knowledge. He states, of his own knowledge, that the rolls of certain-named regiments do not contain the names of "one half" of the men who actually served in them. Investigation shows that the same is true of other regiments of which he makes no mention. I will refer to the 60th, which was recruited mainly in Buncombe County, where many of its surviving officers yet reside. I am reliably informed by survivors of that regiment that at the time it was organized, in the fall of 1862, being at that time transformed from a battalion into a regiment, it numbered not far from 1200 men; and that, with subsequent recruits and conscripts added, its total strength for the war was probably upward of 1500. Yet its muster-rolls, as published in Major Moore's roster, show only 458 names—an omission of 1000 names from the rolls of one regiment!

There is another and conclusive test by which the North Carolina rolls may be judged—the test which is applied in administering the pension laws of that State. The persons entitled to pension under the laws of the State of North Carolina are principally those who were seriously wounded, and the widows of those who were killed in battle, in the Confederate army. In determining the question of service in such cases, it has been found that the published muster-rolls are wholly unreliable as evidence; that hundreds of men are known to have been killed in battle while serving in North Carolina regiments whose names are omitted from the rolls. The North Carolina pension officers, therefore, instead of accepting the muster-rolls as conclusive evidence, as such rolls are accepted by the United States Commissioner of Pensions, are compelled to disregard the rolls and to accept parole testimony to prove the fact of military service, and of death or wounds received while thus serving in the Confederate army. I am advised that there are on the pension-rolls of North Carolina 2798 widows whose husbands were

either killed in battle or died of wounds or disease while serving in that army, and that fully one third of such pensioners were enrolled without any record evidence that their husbands had ever served in the Confederate army, their names not appearing on the published muster-rolls.

The importance of these facts and the bearing which they must ultimately have in determining disputed points in the military history of the war are plainly apparent. There is one conclusion which, independent of any direct testimony bearing upon the subject, has long been settled in the minds of the principal Union commanders; namely, that the strength of the Confederate army was habitually understated in the official reports of its commanders, and has in like manner been understated since by ex-Confederate historians. This conclusion is advanced by General Grant, in his "Memoirs," as follows:

There has always been a great conflict of opinion as to the number of troops engaged in every battle, or all the important battles, fought between the sections, the South magnifying the number of Union troops engaged, and belittling their own. Northern writers have fallen, in many instances, into the same error. The whole South was a military camp.

Conscription was resorted to early, and embraced every male from the age of eighteen to forty-five years. The slaves, the non-combatants, one third of the whole, were required to work in the field without regard to sex, and almost without regard to age. The four million colored non-combatants were equal to more than three times their number in the North, age for age, and sex for sex, in supplying food from the soil to support armies. Women did not work in the fields in the North, and children attended school. The press was free (in the North) up to the point of open treason. The copperhead disreputable portion of the press magnified rebel successes and belittled those of the Union army.

Before the war was over, further conscription (in the South) took those between fourteen and eighteen years of age as Junior Reserves, and those between forty-five and sixty as Senior Reserves. Under such circumstances it is hard to conceive how the North showed such superiority of force in every battle fought. I know they *did not*.

General Grant's opinion was shared by other Federal commanders. Their opinions were not based upon direct evidence relating to the records, but upon their observations, and their knowledge of the resources of the Southern States in men and slaves, and of the fact that those resources were exhausted and drained to the utmost by sweeping measures of conscription. The first Confederate conscript law was enacted before the war had been in progress a year,—March, 1862,—and required the services of all white males, with few exceptions, between the ages of eighteen and thirty-five. In February, 1864, the law required the services of all white males between seventeen and fifty, "for the war," while boys under seventeen and men past fifty were organized into regiments of Junior and Senior Reserves. Even the "free negroes" and a certain number of "slaves" were held liable by this law for the performance of auxiliary military service.

This Confederate statute, approved February 17, 1864, entitled "An Act to increase the Efficiency of the Army," etc., provided: "That all male free negroes, and other free persons of color, between the ages of eighteen and fifty years, shall be held liable to perform such duties with the army, or in connection with the military defenses of the country, as the Secretary of War or the

commanding general of the trans-Mississippi department may from time to time prescribe; and shall receive rations and clothing and compensation at the rate of eleven dollars a month." The same act also provides for the impressment of "slaves" for the same duties, to the number of 20,000.

How many "male free negroes" or "other free persons of color" were impressed under this act, for auxiliary military service with the Confederate army, I have no means of determining.

There is another important fact touching the question of the value of the Confederate records. The records of the Confederate "conscript department" at Richmond appear to have been kept separate and apart from the muster-rolls. These appear to have been deliberately destroyed by order of the Confederate government, to prevent their falling into the hands of the Federal authorities. I have heard this statement made by Major Duffield, a Virginia officer, who declared that he had executed such orders by burning the records in the fireplaces of the building which was occupied by that department, of which he was in temporary charge.

It is easily understood that the total strength of the Confederate army from 1861 to 1865 far exceeded the number of white males in the seceded States "who were between the ages of eighteen and forty-five" as shown by the census of 1860; for that army included, in the last year of the war, men of sixty, as well as boys of sixteen, who were therefore only eleven years old at the census of 1860. The number of white males between eighteen and forty-five in North Carolina in 1860 was 115,369; yet no one pretends to estimate the North Carolina contingent to the Confederate army at less than 125,000, while Major Moore has placed on record an estimate that the State furnished 150,000. The number of white males between eighteen and forty-five in the eleven seceded States in 1860 was 1,064,253. In the three border slave States, Missouri, Kentucky, and Maryland, there was the additional number of 516,175. The people of these three border States were not unevenly divided, and gave about an equal number of men to each army. It is fair to assume from these data that the State of North Carolina could not have furnished more than one tenth of the strength of the Confederate army, which, therefore, in its total aggregate must have numbered not far from a million and a half of men.

The Federal aggregate is of course conceded to have been larger, though it included many who served under short terms of enlistment, and many who, enlisted in the last year of the war, never reached the front; whereas, in the South, substantially all of the fighting men were in the ranks long before the war ended.

The larger percentage of men furnished by Southern States to the Confederate army, in proportion to the population, than was furnished by Northern States to the Union army, may be shown by a comparison of the States of North Carolina and Iowa, which were nearly equal in white population, as shown by the following figures from the census of 1860:

TOTAL WHITE POPULATION.

North Carolina	629,942
Iowa	673,779

TOTAL WHITE MALES BETWEEN 18 AND 45.

North Carolina	115,369
Iowa	139,316

NUMBER OF TROOPS FURNISHED.

North Carolina, incomplete records show.....	104,498
Estimated total.....	125,000 or 150,000
Iowa, complete records.....	76,242

In the consideration of particular battles or campaigns, we naturally reflect that the disparity in numbers present at any specified battle, or in the field at a certain period, cannot be estimated by reference to the total number enrolled in either army for the war.

The disparity in strength of the opposing armies was greatest in the last year of the war, and it never could have been very great until the last year. The Confederate government drew upon their resources far more rapidly than the North; they forced their fighting men early into the field; and this in part accounts for the heroic resistance against odds which they were enabled to display more conspicuously in the closing campaigns, when nine tenths of the Confederate army were the seasoned veterans of many campaigns, while they were opposed, to a considerable extent, by raw recruits freshly drawn from the plentiful and unexhausted resources of the North. However the subject is viewed, it leads to the conclusion that General Grant was right when he emphatically denied that the Confederates were outnumbered in all the important battles of the war. It is certainly true that their muster-rolls were incomplete, and that the official reports of their commanders, therefore, could not have been exact.

Major Moore's published roster of North Carolina troops purports to show the date of enrolment of nearly all of the 104,000 men whose names are preserved on the rolls of that State. I have made a careful examination of this roster, in order to determine approximately the number who appear to have been enrolled during the years 1861 and 1862, and the number stated to have been enrolled subsequent to that period. This roster shows that of the 104,000 men whose names appear therein, about 85,000 (in round numbers) were enrolled in 1861 and 1862, and only about 19,000 subsequent to 1862. Assuming, as above stated, that the State of North Carolina furnished about one tenth of the Confederate troops, these figures indicate an aggregate of Confederate troops for the years 1861 and 1862 of about 850,000; and also that only about 190,000 were added to the Confederate army subsequent to the year 1862. It seems wholly unreasonable to assume that the Confederates raised 850,000 troops in 1861 and 1862, and only 190,000 thereafter, and yet this is the conclusion to which the North Carolina records lead. And I may add that it appears to me suggestive that these North Carolina records should thus appear to have been so full and complete for the first two years of the war, but deceptive for the last two years.

The facts here referred to point to another aspect of the subject, and suggest several inquiries: The Federal army rolls being perfect, why are the Confederate rolls so defective? How can it be accounted for that the rolls of one North Carolina regiment omit more names than are omitted from the rolls of the entire Federal army? Why did the Confederates, as stated by General Grant, "belittle their numbers in every important engagement"?

The principal ex-Confederate historians are those who held high civil or military rank in the Confeder-

ate government. They must necessarily have had knowledge of the resources of their Government, of the actual or approximate strength of their army, and of the character of their official records, whether true and accurate, or the reverse. Great inaccuracy of statement upon these points by such historians can hardly be accounted for upon the ground of ignorance.

The statements usually made by ex-Confederates regarding the strength of their army place the total at about 600,000 or 700,000; whereas, I do not think it would be difficult to demonstrate that the number was not far from 1,500,000.

Alexander H. Stephens, Vice-President of the Confederacy, in his "History of the War between the States," says, "The Confederates, all told, could not have much if any exceeded 600,000." How does this statement of the historian coincide with the estimate of Major Moore that the single State of North Carolina alone furnished 150,000 troops, or with his revised estimate of 125,000, or even with the incomplete records, which show the names of 104,000 men furnished by that State?

The facts herein stated lead me to submit one suggestion, looking to further and more thorough research upon this subject. The "Rebellion Records," so called, comprising the immense mass of Federal and Confederate official reports and correspondence touching the conduct and events of the war, valuable as that publication will be, will not settle this question; and this for the reason that the official records do not show, and perhaps were not designed to show, the true, actual strength of the Confederate army. There is, I believe, but one way in which the question can ever be really settled and removed from the field of doubt and controversy, and that is by an investigation authorized by law, made by the Government, and directed especially to that object. The efforts of ordinary individual research will only invite controversy, and prove unsatisfactory. The Government has in its custody all the captured muster-rolls, but it has made no use of these invaluable historical data. The names upon these rolls should be enumerated by regiments. Investigation would then easily determine how far the rolls of any given regiment fall short of showing its true strength for the war, and how many regiments, like the 60th North Carolina, had three times as many men in their ranks as they had names upon their rolls. The Government has also, in the records of the last census, data which should show the number of Confederate survivors in 1890. The census law of 1889 did not provide for obtaining these data; but I understand that the Superintendent of the Census, in the exercise of the discretion vested in him, found that in enumerating the Federal survivors, as the law required, he could with little inconvenience also enumerate the Confederate; and that, if the other duties of his bureau do not prevent, he will compile and publish the result of such enumeration.

I am deeply impressed with the conviction that the Government at Washington, possessing as it does these important historical data, and the means which would enable it to settle this question, so far at least as it will admit of definite solution, owes it to itself, to the cause of truth and justice, and to the good name of those who fought for its preservation, thoroughly to investigate this question. It ought, at least, to authenticate and

publish every known fact and record in its custody that may throw light upon the question, to the end that history may speak the truth, and may not become the mere trumpet of ignorance and of vague conjecture.

A. B. Casselman.

The Illinois of Lincoln's Time.

PORTIONS of the Lincoln "Life" recall most vividly my childish recollection of the time and the people mentioned there, as well as many points told me by my mother and father.

My father was the A. T. Bledsoe referred to in the history. He practised law in the Supreme Court of Illinois, of which my grandfather, Moses O. Bledsoe, was clerk. He was an intimate associate of most of the men mentioned in this open letter as being prominent in the Springfield of that date, and I have heard him talk by the hour and tell stories of that time.

In those days the character of the courts in which my father, as well as Mr. Lincoln, practised was very primitive, and the stories told by my father are perhaps worth recording.

In one case a livery-stable horse had died soon after being returned, and the person who had hired it was sued for damages. The case finally required some proof that the defendant was a hard rider. A witness was called—a long, lanky Westerner. The lawyer said, "How does Mr. So-and-so usually ride?"

Without a gleam of intelligence, the witness replied, "A-straddle, sir."

"No, no," said the lawyer; "I mean, does he usually walk, or trot, or gallop?"

"Wall," said the witness, apparently searching in the depths of his memory for facts, "when he rides a walkin' horse he walks, when he rides a trottin' horse he trots, when he rides a gallopin' horse he gallops, when —"

The lawyer, irately, "I want to know what gait the defendant usually takes, fast or slow."

"Wall," said the witness, still meditating, "when his company rides fast he rides fast, and when his company rides slow he rides slow."

"I want to know, sir," the lawyer said, very much exasperated, and very stern now, "how Mr. So-and-so rides when he is alone."

"Wall," said the witness, more slowly and meditatively than ever, "when he was alone I wa'n't along, and I don't know."

The laugh of the court at the baffled questioner ended the cross-examination.

A case of sheep-killing came up. The defendant was a rustic, and the charge was, "Killed with malicious mischief." When asked, "Guilty or not guilty?" the defendant would give no direct answer. "I *did* kill that sheep, but I *did* n't kill him with no malicious mischief." Nothing else could be extracted from him. Finally he was told that he must plead something, "guilty or not guilty." He refused to acknowledge himself either. "You must do something," said the judge. "What do you do?" "I stands mute," was all that could be extracted from him. In the end, the case was decided against him, but he was told that he could take it up to the Court of Errors. "If this here ain't a court of errors," said the phlegmatic victim

of the law, "I 'd jest like to know where you kin find one."

In a case (I have forgotten the charge) which went against the defendant, who rose up and gave his opinion of the judgment, and was fined ten dollars for contempt of court, a bill was handed over to the clerk which proved to be twenty dollars.

"I have no change," said the clerk, tendering it to the offender.

"Never mind about the other ten dollars," was the retort. "Keep it; I'll take it out in contempt."

There was in those early days a curious character who presided at the bar; his name I have forgotten, but I remember my father's characterizing him, in Lord Chesterfield's phrase, as "dullness blundering upon vivacities." In a certain case in which this person acted as counsel for the plaintiff, a five-dollar note had been stolen. That fact was proved beyond question. The point at issue finally was one of grand or petit larceny. The counsel for the defendant made the ingenious plea that the bill was an Indiana bill, and worth four dollars and ninety-five cents, and therefore was below the limit of petit larceny, five dollars being that limit. The jury seemed quite impressed by the argument, when the counsel for the plaintiff rose, and in the peculiar drawl and nasal intonation characteristic of his speech said: "Gentlemen of the jury, if any one of you was to take that Indiany five-dollar bill to market, there 's not a butcher there that would not be glad to take it at pa-a-ar. If you was to go to any of the stores on the square here, they 'd be willing and more 'n willing to take it at pa-a-ar; but this mean, confounded sneak could n't afford to steal it at pa-a-ar." The jury rendered a verdict of "guilty of grand larceny."

After General Shields had challenged Mr. Lincoln, and before the preliminaries had been arranged, Mr. Lincoln came into my father's office. He said: "I don't like this duel business. It is very foolish; but I can't show the white feather, and I don't know what I ought to do." My father said: "Lincoln, you are the challenged party, and can choose the weapons. Choose broadswords, and I'll be qualified Shields will never fight you." Mr. Lincoln was very much amused with the notion, and instructed his second to name broadswords as the weapons. When the seconds met and broadswords were proposed, General Shields's second demurred. He said, "Barbarous weapons for the nineteenth century." "Yes," said Mr. Lincoln's second; "they are barbarous; so is duelling, for that matter. It is just as well to have the whole thing of a piece," or words to that effect. When the time for the duel came, my grandfather, father, Dr. Merryman, and some others went to the scene of action. In those days stage-coaches were the only public conveyances overland, and the party had to spend at least one night on the way. The men, as was not uncommon in those days, found very limited accommodations, so four, I think, had to sleep in a bed. My father said that during the night he found himself in very narrow quarters as to the shoulders, while below there seemed ample room to expatiate. In the morning he discovered that his right hand bedfellow, a perfect stranger, had lost his left leg. Dr. Merryman called out in the night to my grandfather, "Wake up, Bledsoe; wake up." Grandpa said, "Dr. Merryman, are you a doctor and don't know that when a man snores it is a sign that he is asleep, *not*

that he is dying?" "Yes; I know," said the doctor. "When most men snore, I know it is a sign that they are asleep; but when you snore it is a sign that nobody else in the house but yourself is asleep."

The news of the proposed duel was noised abroad, and a crowd had collected on the Illinois side of the river, awaiting the return; it seemed to this merry party that the termination of this threatening affair would be unbearably flat if they just came home and announced an apology as the "upshot in the end." So they put a log of wood prostrate in the bottom of the canoe, covered it over with General Shields's cloak, or something equally effective, and then clustered around the supposed victim of the fight, one fanning, another supporting, etc., till the crowd gathered on the opposite bank was worked up to a great pitch of excitement and sympathy. When the log was lifted out the dueling party had effectually turned the laugh from themselves.

Sophie Bledsoe Herrick.

A Remarkable Trial by Jury.

JOSIAH LAMBORN, who was a law partner of Abraham Lincoln, and one of the galaxy of stars that embraced Lincoln, Douglas, Baker, Calhoun, Logan, and Browning, has been nearly eclipsed by the neglect of the generous biographers who have recorded the fame of his compeers. Politics and law in his day were almost inseparable, and he took a leading part as a Democrat in the heated campaign of 1840. He was engaged in a notable debate, with Douglas, Calhoun, and Thomas as coadjutors, against Lincoln, Logan, Baker, and Browning for the Whigs. He was not brilliant in oratory, but correct and calculating. Only once was he beaten in argument, and that was by Stephen A. Douglas.

The following account of Lamborn's power as prosecuting attorney in a celebrated case is furnished by Judge J. H. Matheny, who was at the time a clerk in the Circuit Court, and an eye-witness of the event:

In a neighboring county, in a difficulty arising out of politics, two prominent citizens became involved, and one killed the other. He was arrested and indicted for murder. His friends employed Edward D. Baker to defend him. Baker was just coming to the front as a great criminal advocate; was young, ambitious. Lamborn was prosecutor, and he, too, was young and ambitious, and felt that Baker was a foeman worthy of his steel. The author of this sketch [Judge Matheny] was then studying law with Baker, and was somewhat skilled in the preparation of defenses and selection of juries, and at Baker's request went with him to the trial. The whole county was intensely excited. The trial had assumed a political aspect. The man on trial was a Whig, and the man killed was a Democrat; the party lines were closely drawn, and the friends of the dead man were clamorous for the blood of the man who killed him. The court was held in a large frame building used as a Baptist church, and on the day of the trial it was crowded to its utmost capacity. The jury was impaneled, and the evidence taken. The killing was admitted, and the defense was "justifiable homicide."

Lamborn and Baker were both strangers to the people and jurors, neither having visited that county before, and each determined to win a victory. Lamborn arose to open the case on the part of the prosecution. He was a tall, slim man, with a most singularly musical voice, and the strangest tawny complexion imaginable. His whole countenance was utterly emotionless. Over his voice he had complete control. He simply read the indictment, and then, in a few unimpassioned words, asked a conviction of the defendant. Everybody was astonished and disappointed. I was watching him intently. I knew the man

so well that I was looking for something extraordinary; but his sudden abandonment of the case surprised me greatly. Baker arose for the defense. He was a handsome man—one of the handsomest men I ever knew. Beneath the magic power of his burning eloquence all hearts were subdued, all angry passions were hushed, the fierce cry for blood was stilled, and it could be plainly seen that from every bosom in that vast audience went up the earnest prayer, "Let him go free!"

During Baker's wonderful defense I was watching Lamborn. He sat perfectly still, seemingly totally unconscious of time and place. When Baker sat down and the murmuring ripple of approval had ceased, Lamborn arose in a weary and listless manner, and asked the court to take a recess until after supper, stating that he did not feel well, and needed a little time to prepare his answer to the powerful defense made by Baker. Court adjourned until seven o'clock. After the people had gone Lamborn came to me and asked me to go with him to see the sheriff.

The sheriff came to the front door and invited us in. Lamborn declined, but said: "I am not well, and my eyes are so exceedingly weak that I cannot bear the light. Now I want you to do this for me. When you open the courtroom to-night, I don't want any light in the room but one candle, and I want that placed on the little stand in front of the jury." The sheriff replied: "Will the judge permit that? It will leave the room so very dark." Lamborn said: "I will speak to the judge. It will be all right. Baker made a strong defense, and I must answer it, for that man is a murderer and must be hung, and I can't successfully answer it unless you do as I want you to." "All right—all right," said the sheriff, "if the judge don't object."

Seven o'clock approached, and Lamborn took my arm, and we made our way slowly to the courtroom. As soon as I entered the door I comprehended it all. The house was completely filled, and the one solitary candle, casting its weird, ghostly shadow throughout the room, sent a shivering chill all over me, and, casting my eyes over the faces of the jurors, I could plainly see that the same effect was produced upon them as upon me. Gone were the beaming eyes and joyous countenances as they gleamed and glowed beneath Baker's glorious eloquence; gone the pulsations of mercy that then thrilled every bosom.

Lamborn slowly and deliberately arose in front of the jury, that one candle casting its faint light upon his cold and pulseless face. Half bent he stood, leaning upon a chair in front of him; and thus he stood for fifteen or twenty seconds utterly motionless. Every eye was upon him. Then with a cold and passionless sepulchral voice he said:

"Whoso sheddeth man's blood, by man shall his blood be shed."

He partly straightened himself, pausing for perhaps a half-minute, the ghostly shadows seeming to grow darker around him, when again came the fearful words:

"Whoso sheddeth man's blood, by man shall his blood be shed."

By this time the silence in the room had become absolutely appalling; men ceased to breathe, and their very hearts stood still. He raised himself to his full height, stood perfectly motionless for perhaps a minute, then in words as cold and passionless as death came again the awful denunciation:

"Whoso sheddeth man's blood, by man shall his blood be shed."

Then, pointing his quivering fingers at the jury, and with a voice that rang like a trumpet, he exclaimed:

"Such is God Almighty's awful decree. Dare you disobey it?"

He ceased. It was enough, the work was done; a verdict of guilty followed, and the unfortunate victim passed on to his fate. I have seen in my time wonderful actors, have witnessed some extraordinary scenes on the stage, but never have I seen anything to equal that night's work in that humble court-room.

Lamborn became the law partner of Abraham Lincoln; was appointed prosecuting attorney for Jacksonville, Morgan County, Illinois, and was elected attorney-general of Illinois for 1840-43. He died in 1847.

Samuel Lamborn.

American Artist Series.

JOHN S. SARGENT.

A YEAR ago Mr. Sargent's life-size portrait of a little girl called Beatrice hung at the end of the main gallery, in the place of honor, at the annual exhibition of the Society of American Artists. All New York talked about it, and this was surprising enough, as our city does not often interest itself very keenly in a picture of so unsensational a kind. But it was still more surprising to find that all New York not only discussed but admired this "Beatrice," for as yet it is the way of the world that what artists praise the public does not find quite satisfactory.

In truth, attractive qualities which are not often combined in a picture unite to make this one beautiful in the eyes alike of the most critical and the most ignorant. The charm of the subject is the first thing to be noted—the rare and exquisite individuality of the little lady herself. But, it should quickly be said, we must not overestimate the intrinsic importance of this charm, since it is one that would certainly have been lost under the brush of any but a consummately able artist. To paint a child well is perhaps the most difficult of the portrait-painter's tasks—to preserve the naive, infantile look of a face upon which time and experience have made no marks, and at the same time to express the character and soul which reveal themselves so shyly that the interpreter must be singularly in sympathy with children if he is to perceive them at all. It is one of Mr. Sargent's greatest distinctions that he never fails of entire success when he has a child before him. No painter who ever lived could more sympathetically have expressed the delicate, peculiar personality of little Beatrice with more truth and fullness or with more simplicity; and none now alive could have done it so well. It is worth noting, moreover, that Mr. Sargent did not "costume" the child for the sake of pictorial effect. The dress is one she was in the habit of wearing, and the bird is her own particular pet.

Beauty of color also counts for much in the attractiveness of this portrait. The dress, with its pale-brown stripes and sprinkled flowers, the rosebud-tinted flesh and light-yellow hair, the pink topknot, and the pink and gray bird in its gilded cage, all relieved against the rich, deep tone of the background, unite in a harmony as brilliant as it is pure and tender. The pretty pose, too, must be taken into account, and the scheme of composition, where the height of the canvas, as well as the tall table and cage, so admirably emphasize the fairy-like smallness of the child.

All these things a brother-painter appreciated as fully as the public. And yet he might almost have overlooked them all for a time in admiration for the technical skill displayed—for the truth and beauty, the combined force and delicacy, of the handling. Rarely had the values and texture of flesh been so perfectly reproduced, and never, one was tempted to decide, the values and texture of flesh of this fragile transparency. The treatment of the neck, where white skin, white lace, and white pearls met, was a marvel of delicate vigor, and in all the rest of the canvas it was

wonderful to see how so dashing a brush could produce an effect so complete, refined, dignified, and quiet. One did not feel that brilliant handling had been displayed for its own sake, but simply that the painter had known so exactly what he wanted to do, and been so sure that it was exactly the right thing, that he could not help working broadly and swiftly. It was masterly painting, because a master's eye had seen the subject before the master hand began its reproduction. Mr. Sargent had seen not only form and color with clearness and acuteness, but also the baby soul behind them; and he had reproduced them all so beautifully that, when the tears came in one's eyes from sheer delight, it was hard to tell whether emotion was more touched by the work of nature or the work of art. Yet when we reflect a minute, and say again, A pearl among babies portrayed in a pearl among pictures, we feel that art must be allowed the chief share in the result. Exquisite children are born into the world more often than exquisite works of art, and nothing is beautiful upon canvas unless beautifully painted. Mr. Sargent might have found another model to give him as happy a chance; little Beatrice could hardly have found another painter to do her such absolute justice. To art, not nature, will be due the credit when in later years this child shall win an immortality like that with which a Velasquez or a Van Dyck endowed the royal children of his brush. I should hesitate to say that this is the finest picture Mr. Sargent has painted; but it is one of the very finest, and is certainly the loveliest of them all.

John Singer Sargent was born of American parents in Florence, Italy, in the year 1856. His mother is a Philadelphian, and his father belonged to the Boston family several members of which have been honorably conspicuous in journalism, literature, and science. He studied painting under Carolus Duran in Paris, and evidently, in another fashion, under the spirit of Velasquez in Spain. In 1878 he received an honorable mention at the Salon, and in 1881 a medal of the second class, while at the International Exhibition of 1889 he was given a medal of honor and the rank of chevalier in the *Legion d'Honneur*.

Born in Italy, educated in France, living much in London, and traveling widely, Mr. Sargent is that typically modern product, a citizen of the world. Yet he is not a man without a country. Blood has proved the strongest influence. No American would take him for a "foreigner," and we are only following his own lead when we claim him for the Western World. The pictures which won him the highest honor that could be gained at the Paris Exposition formed the chief feature of the American collection, and though he is a member of the *Société Nationale des Beaux-Arts* in France, he is also a member of the Society of American Artists in New York; and Americans appreciate their good fortune in being able to claim him as a fellow-countryman. Wherever his pictures have been shown they have excited a very unusual amount of interest; prizes have been awarded him in Chicago and Philadelphia; and he is now working upon a large mural painting for the Boston Public Library.

M. G. van Rensselaer.

IN LIGHTER VEIN.

Observations.

THE liar despises those who believe him, and hates those who do not.

THE woman who loves you is at once your detective and your accomplice.

BY the world's law a man is held guilty until he is proved innocent — and afterward.

MODERN pessimism is ancient Calvinism with God left out.

SOME people would like to have an Inquisition to compel liberality and toleration.

To tell a woman you love her without doing so, and then to love her without telling her so, is the Alpha and Omega of flirtation.

How exasperating are those sunny-natured people who will never allow you to complain!

MANY a woman makes a man perfectly wretched because she loves him so much.

If I were as rich as my right-hand neighbor, I should have his faults; if I were as poor as my left-hand neighbor, I should have his. Being myself, I have mine.

A MAN who praises himself meets with general denial; a man who decries himself finds plenty to agree with him.

To believe that evil rules the universe is to believe that the destroying principle once created and now conserves.

As it is man's place to ask, so it is woman's place to wait to be asked; yet oftentimes she has a way of asking why she is kept waiting.

A GREAT many people who discuss great questions think that they must arrive at *some* conclusion, like a debating society. Oftenest we should be satisfied with indecision.

POSITIVE persons may be so either from having tested their opinions by long experience or from never having tested them at all.

WHAT hardens one most is not suffering, but getting over it.

OPPOSITION is a sign of interest. A bored listener always agrees.

THE common run of literature is stenciled, not written.

DID you ever notice the rapturous fervor with which the postman is sometimes received — not for himself, but for what he brings? Be sure that you have been in his position oftener than you know.

THERE are people so actively occupied by misfortune that they have no time to be miserable.

BEWARE of the man who seems to have no earthly chance with a woman. He is more than likely to secure her at last.

A WOMAN'S progress in a love-affair is a zigzag road: each deviation ends in a slight advance. And a man's, which should be a straight line, meets hers at the return from each of these deviations.

Manley H. Pike.

My Sweetheart.

No violet purples have so deep a hue
As do her angel-painted eyes of blue.
A wild-rose pink, a sea-shell's dainty grace,
Were borrowed to bewitch her bonny face.

Her lips were made for kisses — nothing more;
I'll tell her this forever, o'er and o'er.
Forever and a day I'll love her, too,
Because her heart is mine — her heart so true.

She loves and lives, and lives and loves for me,
And for her sake I'll all things lovely be —
For her, my love, my angel, treasure, pearl,
Marie, my own, my darling baby girl.

Margaret Andrews Oldham.

A Cradle Song.

Swish and swing! Swish and swing! Through the
yellow grain
Stoutly moves the cradler to a low refrain,
While the swaying blades of wheat tremble to his
sweep
Till he lays them carefully in a row to sleep;
And he feels a mystic rhyme
Makes his cradle swing in time
To the rocking of the baby by the door.

Swish and swing! Swish and swing! So the cheeks
grow red,
Bowls are filled with porridge, and ovens piled with
bread,
Bossy claims the middlings, and coltie eats the bran,
Chicky gets the screenings, and birdie all he can.
So the cradle's harvest rhyme
Keeps the reaper's stroke in time
With the cradle that is rocking by the door.

Thus the golden harvest falls to yield the precious
wheat.
Life is golden, too, alas! but only love is sweet.
Labor for the fireside is the royal crown to wear,
And Love that gave the harvest will give each heart
its share,
While the reaper swings in time,
Like a loving, tender rhyme,
To the rocking of the cradle by the door.

Swish and swing! Swish and swing! Ah, the good
old sound,
Harvest note of gladness all the world around!
Hear the cradles glancing on the hilly steep;
Hear the little rocker where baby lies asleep —
Gentle, universal rhyme
Of the reaper keeping time
With the rocking of the cradle by the door.

Charles H. Crandall.

Pegasus in Harness.

I HAVE a neighbor; 't is his fate
To deal in bricks and lime.
He'd like to be a poet great,
But can't afford the time.

John Kendrick Bangs.

An Impossible Girl.

ONCE on a time there lived a maid
 Who never was of mice afraid,
 A perfect game of whist she played,
 This maid entrancing.
 Of gowns and styles she never talked,
 Attempts to compliment she balked,
 For exercise she only walked —
 She hated dancing.

She wore no loud, queer-colored glove,
 She never yet had been in love,
 Her bureau held no picture of
 The latest actor.
 And, furthermore, she never went
 To matinées, nor ever spent
 Her change for soda; roses sent
 Could not attract her.

Of slang she never used a word,
 Of flirting she had never heard,
 Society — it seems absurd —
 She did not care for.
 At gay resorts where men were not
 She never seemed to care a jot,
 Until the mothers wondered what
 The girl was there for.

No one will know from whence she came,
 She left no record but her fame,
 Not even can we learn her name
 Or what her station.
 When did she live? How did she die?
 She lived in fancy. It's a lie.
 I've only tried to practise my
 Imagination.

James G. Burnett.

Silent Applause.

THE more his frowning modest worth withdraws,
 The more, forsooth, they lavish their applause.
 In vain. He waits for praise from her alone
 Who will not speak lest love with praise be shown

Edith M. Thomas.

"The Linnet Sings."

By note and word
 My sense is stirred,
 For never clearer song was heard
 Than that the linnet sings.
 Lying near it,
 Full I hear it,
 From the brier where it swings:
 "He kist her — kist her — kist her —
 Sweet — my sweet —
 Sweet sister."

If grief or glee
 Impels this free
 Outpouring of its soul to me,
 My voice will not betray.
 I silent lie
 The brier by,
 And hear it sing and say:
 "He kist her — kist her — kist her —
 Sweet — my sweet —
 Sweet sister."

Think as you will,
 Or well or ill,
 Of what it sings in swinging still
 Upon the brier there;
 It may be glad,
 It may be sad,
 But, oh! the sweetest air —
 "He kist her — kist her — kist her —
 Sweet — my sweet —
 Sweet sister."

To me or you
 It says not who
 This right or wrongful act did do —
 I wonder if it could.
 I only hear
 Its notes so clear
 Go ringing through the wood:
 "He kist her — kist her — kist her —
 Sweet — my sweet —
 Sweet sister."

Henry T. Stanton.

A Cheering Outlook for the Editor.

DEAR friends and fellow-writers, send we our verse no more;
 The editor's strange blindness we long enough deplore.

Come, ye whose wounded spirits with disappointment burn,
 Strike! Let us strike! for even the goaded worms will turn.

Send not your verse in winter, his thoughts are full of care;
 The closing year and opening year bring all *his* mind can bear.

Send not your verse in springtime, lest, like the king of Spain,
 Your poem should go marching forth, and then march back again;

For while our hearts beat blithely with lambkins, buds, and birds,
 Above his pile of poems he mutters, "Words, words, words!"

Send not your verse in summer, he's gone north, east, or west;
 Vacation is as much for him as those who need the rest.

Or if within his office the seething hours are spent,
 He cares less for Apollo's flights than Mercury's ascent.

Send not your verse in autumn, he'll greet it with a frown,
 Such hopeless heaps await him on his return to town.

Come join, ye fellow-writers, in answer to my call,
 In one vast vigintillion and send no verse at all;

And leave him, sadly jingling his overloaded purse,
 To meet December's issue with not a line of verse!

NO. 6.

OUR COMMON ROADS.

THAT the condition of the common road has much to do with the prosperity of both town and country; that it enriches the farmer, and raises him socially, commercially, and financially; that it widens his influence, contributes to the happiness of his family, and brings him in touch with all the improving and civilizing influences of the busier world, there can be no manner of doubt. We are spending, in this country, \$140,000,000 every year for the maintenance of our common schools. Official statistics show that an average of more than thirty per cent. of the pupils are absent from school on every school-day of the year, and that of these absentees by far the larger proportion is made up of our farmers' children. To every one acquainted with the difficulties of traveling the ordinary country road, especially during the wet weather of spring and fall, the reason for this immense falling off in attendance at the public schools will be clearly traceable to the impassable state of the farmers' highway; and thousands of farmers in all parts of the country will testify that they frequently are compelled, by this unfortunate condition, to send their children to inferior schools, which have little to recommend them except mere convenience of location, while a better condition of the roads would enable them to give their children the advantages of more thorough schooling. At every political election, too, the question of the common roads plays an important part; and results have repeatedly established the fact that a heavy rain-storm occurring just before a general-election day will reduce the aggregate vote in many

of our States to so great an extent as to prevent an expression of the popular will. It is by no means an agreeable comment on the institutions of a great nation to say that the success or failure of an important political principle, or the approval or condemnation of a carefully devised policy of government, may depend in so large a degree upon the weather.

We have in the United States something like 16,000,000 of horses and mules above the age of two years upon our farms, and at the moderate estimate of 25 cents as the cost of feed and care of each of these animals, we see at a glance that the aggregate expense of maintaining them is about \$4,000,000 per day. If, by a similarly moderate estimate, we say that they are kept in the stable in a condition of enforced idleness by the deep mud of spring and fall for a period averaging 20 days in each year, we may easily compute that the loss, in this respect alone, will amount to \$80,000,000 per year, a sum sufficient to build 16,000 miles of excellent highway. Of course, considering the great variety of conditions, and the consequent number of factors to be regarded, it is impossible by mathematical formula to compute the loss entailed on any community by the continued toleration of these dirt roads in their present condition; but the error in the result of any computation is more likely to show a loss smaller than actually exists, and in whatever way the matter be regarded, it is certain that with the imposed burden of extra help and extra draft-animals, lost time, wear and tear of wagons and harness, the drawing of light loads, and the depreciated value of farm-lands, we are pursuing

a short-sighted policy in permitting the present system to continue. Besides the actual loss, which a moment's reflection will serve to show, we are gaining nothing and saving nothing in that great department of agricultural industry to which the condition of the dirt road is of such marked importance.

By dwellers in cities the actual condition of these country roads during the wet season is scarcely known; while with farmers, to whom all roads are dirt roads, and who have never seen nor known of a highway better than that which they have used from boyhood, the dirt road is an accepted fixture, which long habit and use have impressed upon them as a natural

the State of New York the country newspapers were printing long editorial complaints of the hopeless condition of the rural highways, and the consequent paralysis of country trade, while commercial reports were published from week to week in which business embarrassments and failures were charged directly to the impassable condition of the country roads. Half-loaded farm-wagons were stalled in deep mud almost in the shadow of the magnificent twenty-million-dollar Capitol at Albany, while, as if to show to what ridiculous ends the perversity of the human mind will sometimes lead us, the good farmers of Albany County were actually sending telegrams to the legislature, asking for the

and necessary adjunct to farm life. On this page appears an illustration showing an actual scene on an important road in northern Ohio in the spring of 1891. It is similar in every essential respect to a thousand other views which might have been taken in that region during the same month, and, indeed, not unlike a countless number of scenes which occurred in most parts of the United States in the spring of that year. Farmers were everywhere mud-bound, traffic was suspended, and even the outlying districts and suburban streets of important towns took on the stagnant condition of remote farms, and suspended all forms of wheel traffic for weeks at a time. In

¹ All the pictures in this article, with the exception of the diagrams, are after photographs from nature.

adjournment of a committee hearing, because the roads of Albany County were too bad to permit them to get to town in time to oppose a bill which promised to make them better!

But aside from the social and political features of this question, and the direct bearing which it has upon the personal income, expense, and economy of the farmer, a bad road increases the first cost of produce—an increase which tends to enhance the price paid by every consumer; and this consideration, if no other, brings the road question home to every reader. On the day of this writing the people of the city of New York are paying \$1.10 per hundred pounds for baled hay which fifteen days ago was selling for 80 cents per hundred in the same market. This increase of price represents

VIEW ON HUNTING PARK AVENUE, PHILADELPHIA, ABOUT FOUR MILES FROM THE CITY HALL, FEBRUARY 23, 1891.

nothing to the farmer, who during the last fifteen days has had no connection with the local market by reason of the deep mud in the country roads. It simply represents an added profit of about 37 per cent. to the middleman or speculator, who, following the unbending rule of supply and demand, trades upon the helplessness of the consumer in a market where he is unhampered by competition.

How long should this costly and paralyzing condition be permitted to continue? Measured by every rule of economy, public or private, these common roads of the United States are not only the worst in the civilized world, but in labor and money we are spending more to carry on a "system" of inefficient and shiftless maintenance than would be sufficient to keep in proper repair double the length of high-class roads under the methods pursued by France, Italy, and other European states. In our struggle for road reform we are following in the footsteps and repeating the history of European nations, where, in the beginning, the same objections were urged, and the same obstacles interposed, which meet the later-day American who is engaging in the same good work. A writer of early English history, referring to the difficulties of agriculture, says:

Roads were so bad, and the chain of home trade so feeble, that there was often scarcity of grain in one part and plenty in another part of the same kingdom. Export by sea or river to some foreign market was, in many cases, more easy than the carriage of corn from one market to another within the country. The frequency of local dearths and the diversity and fluctuation of prices were thus extreme. It was out of this general situation that the first corn-laws arose, and they appear to have been wholly directed toward lowering the price of corn. Exportation was prohibited, and home merchandise in grain was in no repute or toleration.

Writing of a later period, Macaulay makes graphic reference to the difficulties of travel upon English country roads at a time when the English farmers indulged in the same periodical diversion of "working out" their road taxes that is provided for in the antiquated American statutes which we still keep in force for the maintenance of our own highways. He states that in rainy weather the English coaches of that day were compelled to travel along roads which, for miles in succession, were little better than quagmires, and it is said to have been a matter of common occurrence for an English coach to become hopelessly mired in a slough on the public road, and to remain there until

lifted out by the aid of a yoke of cattle from some neighboring farm. Not so are the English roads of to-day. By experiment, and by the better light of experience, the English people and their neighbors all over the European continent have learned that true economy in the construction and repair of the common roads, as in the construction and repair of the great railroads, consists in the scientific making and the systematic maintenance of these roads according to fixed rules, and under the direction of an intelligent head.

In the perfection of this enlightened system it is probable that France leads the world. Al-

These comprise: first, national roads, which generally cross several departments, connecting important cities and towns; and secondly, departmental roads, which connect the chief cities and towns within the department. The less important roads are still further classified and divided; but the roads within a department are under charge of an engineer-in-chief, whose directions to his corps of subordinate superintendents and overseers must be implicitly followed. No part of the road system of France escapes attention, and every road is subdivided into sections varying in length according to its importance, each section being placed in charge

DRAWN BY MALCOLM FRASER.

VILLAGE STREET, SOUTHPORT, CONNECTICUT, WITHIN ONE THIRD OF A MILE OF RAILROAD STATION, APRIL 13, 1891.

though her area is only about four times as great as that of the State of New York, France has spent about \$600,000,000 in the construction of her common roads, and now annually spends about \$18,000,000, or three per cent. of the first cost, in keeping them in repair. France has eighty-seven departments, answering somewhat to our counties, and within these are various forms of local governments bearing some resemblance to that generally adopted in our cities and towns. The Government maintains a large body of trained engineers in its special department of roads and bridges, to whom is intrusted the practical work of constructing and repairing the common roads.

of a man who is held responsible for the constant excellence of its condition. Referring to the economic worth of these roads to the French government, Mr. Francis B. Loomis, commercial agent at St. Etienne, makes report to our Department of State, within the last year, as follows:

The road system of France has been of far greater value to the country as a means of raising the value of lands, and of putting the small peasant proprietors in easy communication with their markets, than have the railways. It is the opinion of well-informed Frenchmen, who have made a practical study of economic problems, that the superb roads of France have been one

DRAWN BY HARRY FENN.

SUBURBAN DESOLATION.

(WAGONS ABANDONED IN DEEP MUD NEAR INTERSECTION OF OGDEN AVENUE AND 22D STREET, CHICAGO, APRIL 6, 1891.)

of the most steady and potent contributions to the material development and marvelous financial elasticity of the country. The far-reaching and splendidly maintained road system has distinctly favored the success of the small landed proprietors, and in their prosperity, and the ensuing distribution of wealth, lies the key to the secret of the wonderful financial vitality and solid prosperity of the French nation.

In a similar report to the home Government, United States Consul Oscar F. Williams, writing from Havre under date of May 29, 1891, says:

Every freighting- and market-cart here is a road-maker. Its tire is from three to ten inches in width, usually from four to six, and so rolls the road. With the few four-wheeled vehicles used, the tires are rarely less than six inches, and the rear axle is about fourteen inches longer than the fore, so that the rear or hind wheels run in a line about an inch outside of the line rolled by the fore wheels: thus, with a six-inch tire two feet of road width is well rolled by every passing wagon. The varied gauge is also usually observed with cabs, hacks, and other four-wheeled vehicles, so that they become road-makers instead of rut-makers, as in our country. The cost of highway transportation over the properly built roads of France does not exceed one third the like expense

in the United States, it being common in the rural districts of France to haul three tons, and in the cities from three to five tons, freight net with one horse.

Differing somewhat in manner of construction from the best roads of France, but still in many respects admirable examples of road-construction, are the important roads of Norway, of which the great highway extending from Christiania to Leirdalsören is conspicuously prominent. This highway is about one hundred and fifty miles long, has a stone foundation, and is thoroughly underdrained — a precaution adopted in the construction of all first-class roads, and uniformly followed by the road-builders, of Europe. For the greater part of the distance this road winds through the mountains of Norway, and in many places great masses of rock have been blasted out along the edge of the river or mountain stream (there is always a river) to make space for the construction of the road. The road-surface is composed of a fine, gritty material, which might be called "pin gravel," combined with a smaller proportion of clay, which seems to serve as an efficient binding material, and, when finished, possesses peculiarly elastic properties, which

HOW ROADS SHOULD BE MADE.

DRAWN BY MALCOLM FRASER.

BREAKING STONE FOR THE COUNTRY ROAD.
(A FAMILIAR ROADSIDE SCENE IN GERMANY.)

forbid the presence of any kind of jarring and give to the rider a delightful sensation resembling that which might be felt by a person traveling over a surface of velvet.

Contrived and maintained under systems bearing much likeness to that of the French government, the roads of Italy, Switzerland, Austria, and some of the German states are but little inferior in quality to, even though less extended than, the roads of France; and, indeed, in every country where the hand of the government has been directed to the making and keeping of the main roads, there seems to have followed an effort at emulation by the local authorities which has led to the similar improvement of the branch roads, and finally to the welding together of all the systems for mutual benefit.

Have we no excellent roads in the United States? Yes: many miles in the aggregate; but in comparison with the immense mileage of important highways which are substantially neglected, and left in a condition unfit for traffic, our good roads are but oases in the great desert of mudways which covers the face of the country. The suburban districts of Boston, the new roads of Union and Essex counties, New Jersey, the celebrated pikes of Kentucky and Tennessee, and the highways of a few other localities, might receive honorable mention in the history of our practical pioneer work; but the failure of the National and State governments to take the lead in a general movement for better roads, and the consequent discouragement of a general engineering knowledge of the maintenance and repair of common roads, have led to the neglect, and in some cases to the actual disintegration, of roads which were well constructed and intended to last through many generations. The need of a law by which the main roads may be reconstructed and cared for by the State governments is every day becoming more clearly apparent.

If you take four pieces of white paper, each having a superficial area equal to about one twentieth of the printed portion of this page, and place them on a hard floor, locating one at each corner of an imaginary rectangle about four feet and a half by six feet in size, they will represent in dimension and relative location the four points of contact upon which the wheels of an ordinary farm-wagon will rest, if made to stand upon the same floor, while each piece of paper will also show, with tolerable accuracy, the entire area of actual contact between the wheel and a hard road-surface in good condition. Here, then, is a foundation of eight square inches or less upon which must be rolled across the country a load varying anywhere from five hundred pounds to ten gross tons in weight; and it is obvious that the mechanical advantages of the wheel can be profitably brought into play only by preserving these points of contact, or tangent points, at their minimum size. Of course, to maintain even a quiescent load of several tons upon so slight a foundation without settling would require a well-made and substantial foundation; but when it is remembered that the foundation is a moving one, and that in its transit along the public highway it is made to carry a rolling, jolting, and pounding burden of perhaps several tons, it is all the more clear that the foundation—to wit, the road-bed and -surface—should be of a smooth and unyielding kind. When, by reason of an excessive load, or the inferior condition of the roadway, the wheel is pressed into the surface of the road, the point of contact is enlarged in proportion to the depth of the depression, and this enlargement continues until the wheel is half submerged; but whether it be great or slight, every increase of the surface of contact involves a corresponding increase of the power required to move the loaded vehicle.

To this fact is mainly due the superior tractive qualities of the Macadam or Telford surface over that of the ordinary dirt road. If the

DRAWN BY H. D. NICHOLS,

AFTER A PHOTOGRAPH BY ARTHUR C. COLLINS.

A LOAD OF HAY IN NORMANDY.

wheels of a loaded wagon be made to roll over a hard Macadam surface in direction from M to N, as shown in fig. 1, the force required to move the wagon is manifestly small, depending for its amount principally upon the weight of

and details about which road-builders radically disagree, the writer will attempt to set forth briefly a few time-proved directions which may safely be followed in ordinary cases where the construction or improvement of a road is undertaken.

DIRT ROADS.

By this term is meant those roads which are formed of the natural soil found in the line of the roadway. They are so common as to be almost our only roads outside of town and city limits, and will for many years be used largely in country districts, and especially on the lines of cross-roads which connect the main highways. Dirt roads, at their best, are greatly inferior to Macadam and Telford roads in every essential of a good highway; in durability, cost of maintenance, drainage, tractive qualities, and, in many locations, in point of economy also. But the dirt road is here, and the public hand must be directed to its treatment. The first and most important thing necessary for the maintenance of a dirt road may be stated in a single word—*drainage*. It is the one thing that can neither be dispensed with nor neglected. Most dirt is soluble, and is easily displaced under the softening influence of rain, and this process is hastened in the dirt road by the passing of heavy wagons over the wet surface. On every mile of roadway within the United States there falls each year an average of 27,000 tons of water—a heavy, limpid fluid, always directing itself to the nearest outlet and seeking the lowest level. Water is hard to confine and easy to release, and yet, through sheer neglect of the simplest principles of drainage, water is the most active destroyer of our country roads.

In providing for the drainage of a dirt road we should first consider the material of which

FIG. 1. SHOWING WAGON-WHEEL SUSTAINED AT SINGLE POINT OF CONTACT ON HARD, SMOOTH SURFACE OF COMPACT MACADAM OR TELFORD ROAD.

the load and the hardness and smoothness of the road-surface. But if the same loaded wagon be moved over the surface of an ordinary dirt road, as in the direction of the arrow shown in fig. 2, the weight of the load and wagon will, in most cases, cause a depression of the surface beneath each wheel, by which a continual obstruction is formed at N' to impede the forward movement of the wagon. Thus a greater amount of power is necessary to draw the wagon, and its computation is made complex and difficult.

Many soils are possessed of elastic qualities, and these are sometimes deemed to be of advantage; but in point of economy in the use of power they are not to be considered in comparison with the Macadam surface, for no dirt surface, however elastic, will rise and give back to the passing wheel (as at M' in fig. 2) the same force which it destroys by the obstructing qualities which it offers to the forward movement of the vehicle.

In all that is hereafter written, then, let it be remembered that hardness and smoothness of surface are two prime qualities in every good highway, and that the insistence of the writer upon thorough drainage, which prevents the softening of the road by rain and flood, and upon thorough rolling, which insures the hardening results of continued pressure, is due to the importance of these qualities of smoothness and hardness in the maintenance of every high-class road.

Of course within the necessary limits of this article no elaborate treatment of the technical side of road-making can be attempted; but a voiding-reference, as far as possible, to those methods

FIG. 2. SHOWING WAGON-WHEEL PRESSED INTO THE SURFACE OF A DIRT ROAD, ENLARGING THE AREA OF CONTACT AND IMPEDING THE FORWARD MOVEMENT OF THE VEHICLE.

the roadway is composed. If a heavy, viscous clay predominates, the ordinary side-ditches should be of good depth, and will even then,

in many cases, be inadequate for thorough drainage without the addition of a center-drain running midway between, and parallel with, the side-ditches. The center-drain should of course be filled with loose irregular boulders, cobblestones, broken bricks, or similar filling, covering a line of tiles or fascines at the bottom, and should be connected with the side-ditches by cross-drains carrying the water outward from the center-drain at proper intervals along the length of the roadway. These center- and cross-drains, and, indeed, the side-ditches also, may be made cheaply after the manner shown in the cross-sections, figs. 5 and 6 on page 812. Center-drains, though often greatly needed for the improvement of country roads, are not in common use. They add somewhat to the cost of the roadway, but, in most cases, considerably more to its value, and should be employed in all situations

depend upon the nature of the clay and sand used, and which can best be determined by experiment), this composition affords many advantages which make it superior to a roadway composed of either sand or clay when used alone. The sand serves to quicken the drainage and to destroy the sticky, tenacious qualities of the clay, while the clay supplies the quality of cohesion in the substance of the road-surface, counteracting the shifting qualities of the sand, and making the roadway more easily packed and rolled, and more likely to retain its proper grade and slope.

ROLLING.

EVERY day it is becoming more firmly established that a good road-roller is the most valuable piece of machinery employed in the

FIG. 3. CROSS-SECTION OF MACADAM ROADWAY LAID ON COMPACT EARTH, AND MADE SOLID AND PERMANENT BY HEAVY ROLLING.

where sand or gravel cannot be had to relieve the heaviness and water-holding properties of the clay. If gravel, sand, or other porous material can be conveniently or cheaply obtained, the center- and cross-drains may often be dispensed with by mixing the gravel or sand in plentiful quantities with the clay roadway, so as to insure as nearly as possible a porous and self-draining surface-layer, which should not be less than ten inches in depth, and should be laid on the rounded or sloped subsoil so as to insure easy drainage into the side-ditches.

In locations where the prevailing material is of a loose, sandy nature, the difficulties of drainage are more easily overcome, and side-ditches, if found necessary at all, may be made of moderate depth and left open, without incurring the risks and dangers of travel that prevail where the deeper open ditches are used for draining heavier soils. But, on the other hand, the light and shifting nature of sandy road-material destroys its value as a surface layer for an earth roadway, and its deficiency in this respect is most easily remedied by the addition of a stronger and more tenacious substance, such as stiff clay. When mixed with sand in proper proportions (which in each case

road-maker's art; and indeed, without it, neither can the foundation or subsoil of the roadway be made uniformly hard and reliable, nor the surface-layer be given that uniform compactness and solidity which give excellence to the road and insure a perpetual economy in the cost of maintenance and repairs. To one who has seen a heavy road-roller used in compacting the soil of a new roadway these facts will be very evident. If a length of one thousand yards in an ordinary earth road be cut to an exact and uniform grade one foot below the original surface of the road, it will be found in most cases that the new surface thus exposed will present an appearance which, to the ordinary observer, is of a uniform material and even hardness from end to end: but the passage of a roller weighing from ten to fifteen tons over this new surface will soon disclose defects and soft spots located at irregular intervals throughout the length of the work; and as the process of rolling continues, the uniformity of the grade will disappear, and what at first appeared to be a tolerably satisfactory surface will develop into a succession of humps, holes, and undulations. In the using of the roller in actual work these depressions and soft spots are carefully filled

and brought to the line of the required grade, while the successive passing of the heavy roller over the filling gives to the entire road that form and consistency which are so essential to every good highway. It is true that heavy rollers are rarely used in the construction or improvement of dirt roads; but this is owing as much to a lack of knowledge of the real value of a good roller as to the apparently formidable outlay involved in its first cost. All dirt roads become hard and passable by the use of a roller. Every wagon-wheel acts as a roller upon the road-surface, and the value of its rolling qualities depends upon the width of the wheel-tires and the load which the wheel sustains; but the wagon-wheel is generally made so narrow as to create ruts in many cases, and its use always tends to develop the weak spots, humps, holes, and undulations which are so quickly revealed in the use of the regular roller. Moreover, the

the county authorities in the fact that a good road-roller, when not profitably employed upon the higher-class Macadam or Telford roads, may often be made to serve with value and economy in the improvement of adjacent dirt roads. In the grading of a dirt road the work may generally be cheapened and improved by employing one of the various forms of "road-machines" which have come into use within the last few years. In its common form this machine is provided with an adjustable steel-shod blade which cuts, scrapes, and forms the earth to the desired grade, and, when drawn by one or two teams, generally performs its work in a commendable and satisfactory way.

MACADAM ROADS.

In the construction of a Macadam road the experience of a century has warranted modern

FIG. 4. CROSS-SECTION SHOWING WASTEFUL USE OF MACADAM MATERIAL.

rolling qualities exerted by the wheels of passing traffic are never bestowed uniformly upon the entire width of the roadway, but are confined throughout the length of most country roads to the two narrow lines of travel which marked the tracks of the wheels of the first passing vehicle, and which seem to have been followed with scrupulous care by all the vehicles which came after. The result is that the roadway on both sides of these beaten tracks is often left in a soft, muddy, or rutty condition, and when two heavily loaded vehicles are compelled to pass each other, the necessity of turning out results in a break-down, or in the delay and difficulty which are familiar to every farmer just in proportion to the number of times that he has been stuck in the mud by reason of the conditions here described. The writer has made mention here of the value and use of a road-roller in connection with the maintenance of the ordinary dirt road, not with the belief that expensive road-rollers will be purchased for use solely upon the dirt roads in our country districts, but rather because it is believed that in the near future every progressive county will make use of the road-roller in the making and keeping of its important roads and streets, and that a hint given here may serve to instruct

road-builders in departing somewhat from the rules which Macadam believed to be imperative; but in its prominent features the Macadam road, properly so called, is to-day not unlike that built by its original maker. The first consideration to be looked after in the construction of a Macadam road is the probable traffic, and consequent wear and tear, to which the road will be subjected. Macadam roads are by no means the best in locations where heavy traffic is to be provided for, and are generally inferior to the Telford road for reasons which may presently appear. But Macadam roads, when made with care, are infinitely superior to the ordinary dirt roads, and are most excellently adapted to suburban localities where the travel is not too heavy, and where the earth bottom can be made firm and compact. It is not uncommon in some of our States to find the idea prevalent with town authorities that the purchase of a stone-crusher, and the turning out of a large mass of broken stone which can be dumped in irregular quantities along the length of a country road, to be leveled and worn down by passing traffic, will result in the formation of a Macadam road, and such a process is sometimes misnamed macadamizing. To say nothing of the false economy generally en-

tailed by such a process, it may be asserted to be not only wholly unlike the method of road improvement which Macadam instituted, but it is in direct violation of the principles upon which he most strongly insisted.

The evil results of this shiftless and unsystematic use of broken stone may not only be seen in the long and toilsome process of rolling this material into passable shape by the wheels of wagon traffic, but it involves questions of economy in the use of material, and in the permanency of the road itself, which ought to be considered. In fig. 3, page 810, the writer has attempted to show the permanent form of cross-section which a well-laid and well-kept Macadam road will always retain. The earth foundation B, having first been consolidated by the use of a heavy roller passed over its surface many times in preparing it for the stone, and having also been shaped into a convex cross-section so as to insure the quick drainage of such water as may find its way through the upper surface, is well adapted to receive the stones of the superstructure which are shown at A, and which have also been laid in successive layers and consolidated by ample rolling, as is elsewhere described. The evil consequences of neglecting to roll the earth foundation, and to give it the proper form to insure drainage, are illustrated in fig. 4, in which B is again the earth upon which the stone has been laid. The dumping of loose stone upon the soft and flattened earth foundation in this case invites disaster in many ways. In the first place, the loose, open texture of the superstructure readily admits the water of rain and melting

into the soft dirt, and in such cases it too often happens that the remedy attempted results in the adding of new material in the same neglectful and slovenly way as marked the putting down of the first. The writer feels confident in saying that he can point out sections of Macadam highways in the United States where, by the wasteful process just described, enough stone has been sunk into the earth foundation of the road-bed to serve in the building of six times the same length of excellent Macadam road.

In the proper construction of a Macadam road, then, rolling of the earth foundation is of prime importance, and it is essential also to give to the earth foundation a cross-section having a convex form, so as to quicken its draining qualities. The necessity for this rolling process may easily be gathered from what has been here written under the head of dirt roads, and the same reasons which have been urged in favor of rolling the earth foundation are found to exist in rolling the layers or courses of the Macadam superstructure. This superstructure is principally of broken stone, hard rock such as flint, granite, and the better qualities of limestone being in all cases preferred. In regard to size, the largest admissible stone should be small enough to pass through a ring two and one half inches in diameter, though Macadam himself specifies that the largest stone in this road should be determined by weight, and seemed to prefer a somewhat smaller stone as the maximum to be used. Theoretically, the stones of the Macadam road should be as nearly cubical in shape as possible, as indicated in fig. 10, where the largest of the three rough cube-shaped stones represents about the maximum size to be used in Macadam construction, and in the upper course of Telford roads, to which reference will be made elsewhere.

In a Macadam road the thickness of the road-covering need not in any case exceed nine or ten inches when completed, and in many locations, where the road has been subjected

snow, and this water, passing quickly through the sieve-like material, still further softens the earth beneath. Then the weight of the stones themselves, added to that of heavy wagons which pass over the road, serves to press the loose, angular stones down into the soft earth beneath, while the dirt itself seems to permeate the body of the stone, and eventually to find its way to the surface, where it forms into puddles and hastens the disintegration of the entire structure. In this condition the passing of loaded wagons for a considerable time results in the disappearance of the Macadam stone

only to light traffic, even six inches have been found sufficient. Stone roads somewhat resembling the Macadam in form, and having a thickness of only six inches, are by no means uncommon in France, and have been successfully used in some of our New England States. Macadam mentions one case in which he declares that the road had been allowed to wear down to a thickness of only three inches, and that "this was found sufficient to prevent the water from penetrating, and thus to escape any injury from frost." It thus appears, as it will appear in all cases, that the efficiency of the

Macadam road, beyond a certain limit, does not depend so much upon the amount of material used in its construction as upon the manner in which that material is applied.

Drainage of Macadam roads, as of all roads, must be provided for, and the question of drainage admits of such extended scope in its treatment that it can be attempted here only in the briefest way. Suitable side-ditches should in all cases be provided, and center- and cross-drains may profitably be added wherever heavy water-holding clays and similar soils present

the same conditions as have been referred to in recommending drainage of ordinary dirt roads. But some of the objections and dangers of open side-ditching have already been pointed out, and in the construction of Macadam and Telford roads it is infinitely better to avoid their use as much as possible. This can be done in many situations by substituting covered drains upon each side of the roadway; and these covered drains may be made in a variety of ways, depending for their cheapness and ease of construction upon the mate-

MATTAPAN STREET, MILTON, MASSACHUSETTS, SEVEN MILES FROM BOSTON.

rials most conveniently at hand, and upon the ingenuity of the road-maker. Two forms in common use are shown in figs. 5 and 6.

In fig. 5 there appears in the shaded outline the ordinary form of an open ditch as constructed in stiff soils, where the sides may be cut with a steep incline without danger of caving in. The ditch so opened is made with a longitudinal grade at the bottom, corresponding with more or less exactness to the grade of the road-surface. Upon the graded bottom of the ditch is laid a succession of planks or flat stones, and upon this is placed a line of ordinary U tiling with ends set close together, so as to prevent, as much as possible, the introduction of foreign substances into the waterway of the tile. The tiling is then covered with straw, hay, coarse marsh-grass, or similar substance, still further to protect it from the introduction of dirt, and the ditch is afterward filled nearly to the top with coarse, irregular-shaped stones of various sizes, the work being completed by the addition of finer stones and sharp gravel, so laid as to invite the free passage of water from above. As these side-drains

are generally located at about the lowest point in the cross-section of the finished roadway, the covering layer of the drain should be given a concave or gutter-shaped section as shown in the illustrations, so as to hold the water which runs off from the roadway and to carry it along in the line of the surface grade, depositing in adjacent culverts or watercourses such portions of the surface-water as fail to become absorbed by the porous material of the side-drains. Whenever it appears that natural waterways, culverts, or other artificial outlets occur at frequent intervals along the roadway, the expense of side-ditches and drains may be entirely saved by simply forming a concave-paved gutter, as shown in fig. 7, along which the surface-water may be carried by a proper grade to the nearest outlet; but in this form of construction it is essential that the earth foundation be properly shaped and rolled hard before the Macadam material is put on, and that the latter should be finished with great compactness, so as to resist the introduction of water, and the consequent softening of the earth foundation which is likely to follow. Fig. 6 represents another

and somewhat cheaper form of side-drain, in which fascines are bound together in separate bundles and laid along the bottom of the drain, instead of the tiling. The fascines are covered with straw and coarse, porous material in the same manner as was shown in the description of fig. 5. Flat

FIG. 8. ROUNDED PEBBLES AND SMALL COBBLESTONES TO BE CAREFULLY EXCLUDED FROM ALL MACADAM AND TELFORD ROAD-MATERIALS.

FIG. 9. SHOWING FORM AND SIZES OF STONE CHIPS COMMONLY USED FOR THE TOP LAYER IN CONSTRUCTION OF MACADAM AND TELFORD ROADS.

FIG. 10. SHOWING ROUGH CUBE-SHAPED STONES OF PROPER SIZE AND FORM TO BE USED IN MACADAM AND TELFORD ROADS. In the "intermediate" courses of either form of construction moderately larger sizes may be employed; but in top courses it is always best to restrict the workmen to a maximum-size stone not materially greater than that shown at the left of the figure.

stones or bricks are sometimes laid at the bottom of the side-drains, so as to form an open waterway with angular cross-section; and other methods are pursued, all leading to the same end and based upon the same principles of construction.

After the road-bed has been properly excavated, the drainage provided for, and the earth foundation properly rolled and shaped, a layer of broken stone from four to six inches in thickness, and never exceeding the latter figure, should be spread evenly upon the surface of the earth foundation, and rolled until it has become thoroughly compact. In this process of rolling, a sharp, clean binding material in moderate quantities may be added to advantage, but on no account should loam, dirt, or other soft material be used, since these soon turn to mud by the addition of water. After the first layer is thoroughly consolidated, the second layer may be added, being spread evenly and smoothly over the surface of the finished course, and in its turn rolled until firmly compacted. In rolling these Macadam layers into a compact form, it is frequently found best to sprinkle the surface with water, as is recommended elsewhere in the construction of Telford roads. After the completion of the second course of macadam, a top or finishing layer of clean gravel or fine stone chips not exceeding two inches in depth should be spread evenly over the whole surface and thoroughly consolidated by rolling. For this top layer perhaps nothing is better than the fine chips and gritty material which may be found in every quarry where the breaking of stone is carried on, and if this cannot be otherwise obtained, it may be broken from the larger stones by a crusher

specially adjusted for that purpose. The small stones used in this finishing layer are usually in size and shape somewhat like those represented in fig. 9, and the largest stone used for this purpose should not exceed three quarters of an inch in its greatest dimension. The completion of the top surface just described marks the finished work of the construction of a Macadam road, and it is then ready for use. A partial cross-section of a completed Macadam road is shown in fig. 3, in which A represents the consolidated stones resting upon the rolled and compacted earth foundation B. The top view and cross-section of the finished Macadam road are shown on a small scale in fig. 7, where A again represents the finished superstructure and B the compact earth foundation.

An important thing to be kept in view in the construction of roadways of the Macadam, Telford, and kindred types is the necessity of excluding from the road-material all rounded stones of whatever size. Such stones are most damaging in their effects when incorporated in the structure of any of these roads, and the greatest care should be taken to prevent their use. On many occasions mere pebbles of the

size and form shown in fig. 8 will in some manner find their way between the flat and angular stones of the superstructure, destroying the compactness of the roadway and preventing that snug settling and wedging of the angular stones which are so essential to the proper completion of the road.

TELFORD ROADS.

THE system of Thomas Telford, whose name for many years has been used to designate the

kind of road which he advocated, differs from the Macadam system in many particulars, the most important of which prescribes the use of a sub-pavement of large stones set in in courses upon the earth foundation.

Since the time of Telford, and indeed in his own day, road-builders have modified his rules without in any way detracting from the excellent quality of their work. For example, in some cases it has been found better not to prepare a level bed for the road-materials as Telford advised, but rather to give to the earth foundation a downward slope from the center-line to each side of the roadway, so as to insure a convexity of cross-section parallel to the cross-section designed for the road-surface when completed. According to the original Telford specifications the convex form of the finished surface was obtained by varying the size of the stones used in the sub-pavement, and by placing the deeper stones in the center of the road, while those of less depth were placed in the order of their decreasing size from the center to the sides of the roadway. This method, while possessing excellent features, appears in some cases to have the disadvantage of requiring a careful assortment of the sub-pavement stones, and it may also be questioned whether the leveled earth foundation is as well suited to insure sub-drainage as is the rounded earth

foundation which in late years has come to be more commonly used. The construction of the Telford road may be better understood by reference to some of the accompanying figures. In fig. 11 C represents a portion of cross-section, or end view, of the Telford sub-pavement laid on a well-rolled earth foundation, with the broadest edges of the stone laid lengthwise across the road. In the interstices between

ly done, as it insures the solidity of the sub-pavement, and serves to prevent the dropping or settling of all materials which are subsequently put on. When finished, the sub-pavement should present a general uniformity of outline, with a moderately roughened surface caused by the irregular upper edges of the pavement stones and chips — an irregularity which serves well to prevent the shifting and sloping of the

these larger stones of the sub-pavement are wedged and firmly packed the smaller stone chips. At D in the same figure is shown a top view of portions of three successive layers, or courses, of sub-pavement stones, in which may be seen the rough, irregular upper edges of the large stones, and the chips and smaller fragments which have been wedged and packed into the interstices. This wedging and packing should be most carefully and thoroughly

A ROAD NEAR TRYON CITY, NORTH CAROLINA.

smaller stones above, and to insure the compact binding together of the entire structure. In the making of a Telford road it is important to remember that the stones used in the sub-pavement need not be selected with regard to their hardness, and that stones may be used in this part of the work which would be wholly unsuited to situations where they might be exposed to direct contact with heavy vehicles. Another practical point to be remembered in the laying of the sub-pavement is that the driving and wedging of chips and smaller stones into the interstices of the sub-pavement must not be permitted near the face of the unfinished work, as this practice would result in the loosening and forcing apart of the larger stones of the sub-pavement.

After the completion of the sub-pavement at least two separate layers of broken stone are

generally put on to form the upper and finishing course of the roadway. The intermediate course next to the sub-pavement is made of broken stones somewhat after the manner of Macadam material, although these need not be, and in practical work generally are not, of the same uniform size and quality as are required for the finishing layer. The stones used in the intermediate course may vary in size from one inch to three inches in their largest diameter, and this course should be at least four inches thick, free from dirt, and laid in a bed of uniform thickness to preserve the regular contour of the roadway. In putting down this course, the heavy roller should again be employed to compact and consolidate the stones, so that the repeated passing of the roller over its surface will produce no settling, hollows, or uneven places. Before

completing the rolling, a quantity of clean, sharp sand should be laid on the surface of the intermediate course, evenly and in sufficient amount, and over this the roller should be passed repeatedly, after having first sprinkled the sand with a sufficient quantity of water to prevent its sticking to the surface of the roller.

The top or surface course is the finishing work in the building of a Telford road; and in the making of this course great care must be had both in selecting the material to be used and in the method of laying it down. All the stones of this course should be of uniform size, and all stones should be rejected from this material which are too large to pass through a ring having an inner diameter of two inches. If trap-rock can be obtained for this course, it can be used with the assurance that a better material is scarcely obtainable; but if trap-rock cannot be had, there are several varieties of hard granite and limestone which make excellent substitutes, and which are frequently used with success.

The top or surface course should be laid with a uniform depth of not less than three inches, and after being compactly rolled it should show a thickness of at least three inches above the intermediate course. After the loose stones for the top course have been evenly laid over the surface of the intermediate course, so as to show the form of the completed roadway, the roller should be run over the new surface just enough to render it moderately compact, and for this purpose a light roller will be sufficient. Then a light coat of clean, sharp sand should be put on, and sprinkled as in the case of the intermediate course, after which, by the use of splint brooms, the sand may be worked in between the stones of the surface, while the heavy roller is made to follow, pressing the small stones

DRAWN BY HARRY FENN.

A MOUNTAIN ROAD IN NORWAY.

firmly into a compact mass. The rolling should proceed backward and forward in line with the direction of the road, beginning at the side or gutter of the roadway, and working toward the center. The process of rolling and adding moist sand should continue until each stone becomes so firmly bedded, and the finished surface so hard, that more sand cannot be pressed into the surface, after which all loose material remaining on top of the road may be removed, so as to leave the surface smooth and complete. This process of rolling the top sur-

(AN IMPORTANT BUT BADLY KEPT ROAD, SHOWING DEEP RUTS CAUSED BY THE USE OF NARROW WHEEL-TIRES.)

face can hardly be continued too long or done too thoroughly. In France it is no uncommon thing for engineers to require that this rolling shall be continued until a cubic inch of hard Macadam material laid on the finished surface of the road shall be crushed by the roller without being pressed into the finished surface or marring its compactness.

Macadam himself declaimed most loudly against binding material; but the methods of both Macadam and Telford were anticipated by Trésaguet, a French engineer, whose methods have been followed with eminent success by the road-builders of France. The system of Trésaguet involved the use of a binding material, and it is now generally adopted in the construction of roads both in England and America. Every stone road comes eventually to be supplied with a binding material into which its component parts are bedded and by which its voids are filled. This may easily be seen by the examination of any of the old Macadam roads which were originally laid without a binding material, and which, after a long term of years, are found to contain a gritty substance which completely fills all the voids between the original stones. The use of binding material in the first instance insures and hastens the compacting of the roadway,

and, if the materials be of proper quality, in no way detracts from the character of the work.

In fig. 12 is shown a cross-section and top view of a Telford road in process of construction after the manner here described. The portion at A represents the finished surface of the broken-stone layer or course after the completion of the rolling, and the portion at B is the compact earth foundation upon which the sub-pavement has been set. The concave portion on each side of the road serves as a gutter to carry surface-water lengthwise in the direction of the roadway into the nearest watercourse or culvert; and where no watercourse is conveniently near, it is best to introduce side-ditches or -drains as described in that portion of the text which refers to Macadam roads. It may briefly be said that this form of concave gutter is not so commonly used as curb gutters, in which the curbstone is set nearly vertical, inclining slightly outward from the roadway, and forming an angle with the road-surface at its lowest point, somewhat after the manner of the street gutter seen in cities and towns. Such a form of construction permits of a more thorough use of the roller on the entire road-surface, but in districts where suitable stone for curbing cannot be had cheaply, the concave gutter may be well substituted.

Isaac B. Potter.

THE NATURE AND ELEMENTS OF POETRY.¹

II. WHAT IS POETRY?

THESE lectures, as I have intimated, are purposely direct of statement, and even elementary. From my point of view this does not of itself imply a disrespect for the intelligence of the listener. The

most advanced star-gazer holds to his mathematics; while, as to poetry, enthusiasts find it easier to build fine sentences than to make clear to others, if to themselves, the nature of that which affects them so inspiringly. I trust that you are willing, in place of the charm of style and the jest and epigram of discourses for entertainment, to accept a search for the very stuff whereof the Muse fashions her substantial garments—to discover what plant or moth supplies the sheeny fiber; in what heat, what light, the iridescent fabric is dyed and spun and woven.

It has occurred to me—I think it may not seem amiss to you—that this eager modern time, when the world has turned critic, this curious evening of the century, when the hum of readers and the mists of thought go up from every village; when poetry is both read and written, whether well or ill, more generally than ever before; and when clubs are formed for its study and enjoyment, where commentators urban or provincial, masters and mistresses of analytics, devote nights to the elucidation of a single verse or phrase—it has occurred to me that this is an opportune time for the old question, so often received as if it were a jet of cold water upon steam or the stroke of midnight at a masquerade—an apt time to ask ourselves, What, then, *is* poetry, after all? What are the elements beneath its emotion and intellectual delight? Let us have the primer itself. For, if such a primer be not constructible, if it be wholly missing or disdained, you may feel and enjoy a poem, but you will hardly be consistent in your discourse upon it, and this whether you concern yourself with Browning, or Meredith, or Ibsen,—as is now the mode,—or with the masterworks of any period.

NEVERTHELESS, we too must begin our answer to the question, What is poetry? by declaring that the essential *spirit* of poetry is inde-

finable. It is something which is perceived and felt through a reciprocal faculty shared by human beings in various degrees. The range of these degrees is as wide as that between the boor and the sensitive adept—between the racial Calibans and Prosperos. The poetic spirit is absolute and primal, acknowledged but not reducible, and therefore an axiom of nature and sensation.

To state this otherwise: it is true that the poetic essence always has been a force, an energy, both subtle and compulsive; a primal force, like that energy the discovery of whose unities is the grand physical achievement of this century. The shapes which it informs are Protean, and have a seeming elusiveness. Still, even Proteus, as Virgil tells us, is capturable. Force, through its vehicle of light, becomes fixed within the substance of our planet; in the carbon of the fern, the tree, the lump of coal, the diamond. The poetic spirit becomes concrete through utterance, in that poetry which enters literature; that is, in the concrete utterances of age after age. Nothing of this is durably preserved but that which possesses the crystalline gift of receiving and giving out light indefinitely, yet losing naught from its reservoir. Poetry is the diamond of these concretions. It gives out light of its own, but anticipates also the light of after-times, and refracts it with sympathetic splendors.

With this uttered poetry, then, we are at present concerned. Whether sung, spoken, or written, it is still the most vital form of human expression. One who essays to analyze its constituents is an explorer undertaking a quest in which many have failed. Doubtless he too may fail, but he sets forth in the simplicity of a good knight who does not fear his fate too much, whether his desert be great or small.

In this mood seeking a definition of that poetic utterance which is or may become of record,—a definition both defensible and inclusive, yet compressed into a single phrase,—I have put together the following statement:

Poetry is rhythmical, imaginative language, expressing the invention, taste, thought, passion, and insight, of the human soul.

First of all, and as a corollary,—a resultant

¹ A series which formed the initial course, delivered in March, 1891, of the Percy Turnbull Memorial Lectureship of Poetry, founded at Johns Hopkins University by Mr. and Mrs. Lawrence Turnbull of Baltimore.

from the factors of imagination and expression,—we infer that poetry is, in common with other art products, a creation, of which the poet is the creator, the maker. *Expression* is the avowed function of all the arts, their excuse for being; out of the need for it art in the rude and primitive forms has ever sprung. No work of art has real import, none endures, unless the maker has something to say—some thought which he must express imaginatively, whether to the eye in stone or on canvas, or to the ear in music or artistic speech; this thought, the imaginative conception moving him to utterance, being his creative idea—his art-ideal. This simple truth, persistently befogged by the rhetoric of those who do not “see clear and think straight,” and who always underrate the strength and beauty of an elementary fact, is the last to be realized by commonplace mechanicians. They go through the process of making pictures or verses without the slightest mission—really with nothing to say or reveal. They mistake the desire to beget for the begetting power. Their mimes and puppets have everything but souls. Now, the imaginative work of a true artist, conveying his own ideal, is creative because it is the expression, the new embodiment, of his particular nature, the materialization of something which renders him a congener, even a part, of the universal soul—that divinity whose eternal function it is to create. The expressive artist is to this extent indeed fashioned after his Maker. He can even declare, in the words of Beddoes, who used them, however, to reveal his surprising glimpses of evolution:

I have a bit of *Fiat* in my soul,
And can myself create my little world.

At the same time, the quality of the poet's creation, be it lyrical, narrative, or dramatic, is in a sense that of revelation. He cannot invent forms and methods and symbols out of keeping with what we term the nature of things; such inventions, if possible, would be monstrous, baleful, not to be endured. But he utters, reveals, and interprets what he sees with that inward vision, that second sight, the prophetic gift of certain personages—that which I mean by “insight,” and through which the poet is thought to be inspired. This vision penetrates what Plato conceived to be the quintessence of nature, what Wordsworth, in his very highest mood, declares that we perceive only when

We are laid asleep
In body, and become a living soul:
While with an eye made quiet by the power
Of harmony, and the deep power of joy,
We see into the life of things.

The creative insight, according to its degree, is allied with, if not the source of, the mysterious endowment named genius, which humdrum intellects have sought to disallow, claiming that it lies chiefly in one of its frequent attributes,—industry,—but which the wisdom of generations has indubitably recognized. The antique and idealistic notion of this gift is given in “*Ion*”: “A poet . . . is unable to compose poetry until he becomes inspired and is out of his sober senses, and his imagination is no longer under his control; for he does not compose by art, but through a divine power.” The modern and scientific rendering is that of the exact investigator, Hartmann, who traces this power of genius to its inmost cell, and classifies it as the spontaneous, involuntary force of the untrammelled soul—in precise terms, “the activity and efflux of the Intellect freed from the domination of the Conscious Will.” Whichever statement you accept,—and I see no reason why the two are not perfectly concordant,—here is the apparently superhuman gift which drew from Sophocles that cry of wonder, “*Æschylus* does what is right without knowing it.”

As an outcome of genius producing the semblance of what its insight discovers, poetry aims to convey beauty and truth in their absolute simplicity of kind, but limitless variety of guise and adaptation. The poet's vision of these is shared to some extent by all of us, else his appeal would not be universal. But to *his* inborn taste and wisdom is given the power of coadequate expression. Taste has been vilely mistaken for a sentiment, and disgust with its abuse may have incited the Wordsworthians and others to disqualify it. They limited their own range by so doing. The world forgives most sins more readily than those against beauty. There was something ridiculous, if heroic, in the supercilious attitude of our transcendentalists; not only putting themselves against the laity, but opposing the whole body of their fellow-seers and -artists, whose solace for all labors ever has been the favor of their beloved mistress Beauty—the inspirer of creative taste.

The truth is that taste, however responsive to cultivation, is inborn—as spontaneous as insight, and, indeed, with an insight of its own. Schlegel's alertness with respect to the esthetic moved him to define even genius as “the almost unconscious choice of the highest degree of excellence, and, consequently,” he added, “it is taste in its highest activity.” Profound thinkers, lofty and unselfish natures, may flourish without taste: if so, they miss a sense, nor only one that is physical—something else is lacking, if the body be the symbol of the soul. I would not go so far as to say of one born, for instance, without ear for melody, that there

will be "no music in his soul" when that is disembodied. It is finer to believe that

Whilst this muddy vesture of decay
Doth grossly close it in

such a one cannot hear it; that

The soul, with nobler resolutions deck'd,
The body stooping, does herself erect.

But taste, whether in or out of the body, is a faculty for want of which many ambitious thinkers have in the end failed as poets. It is a sense, however, the functions of which are very readily assumed and mechanically imitated. At periods when what are called false and artificial standards have prevailed, as in French and English letters from 1675 to 1790, the word "taste" has been on every one's lips, and the true discernment of beauty has been supposed to be supreme, when in fact merely the crown and scepter of taste have been set up and its mantle stuffed with straw. At this very time art is suffering everywhere from an immense variety of standards and models, and our taste, in spite of the diverse and soulless yet attractive productions of the studio and the closet, is that of an interregnum.

Assuming that the artist's conceptions are spontaneous and imaginative, their working out brings into play the conscious intellect. He gives us thought, building up masterpieces from the germinal hint or motive: his wisdom is of so pure a type that through it the poet and the philosopher, in their ultimate and possible development, seem united. It is the exclusive presentation of thought and truth that makes poetry didactical and hence untrue in the artistic sense. For taste has been finely declared to be "the artistic ethics of the soul," and it is only through a just balance of all the elements in question that poetry rises above ordinary and universal human speech and becomes a veritable art.

Under the conditions of these reciprocal elements, the poet's nature, "all touch, all eye, all ear," exalted to a creative pitch, becomes *emotional*. Feeling is the excitant of genuine poetry. The Miltonic canon, requiring the sensuous beauty which taste alone insures, demands, last of all, as if laying stress upon its indispensability, that poetry should be passionate. It is the impassioned spirit that awakes the imagination, whose taste becomes alert, that hears whisperings which others do not hear,—which it itself does not hear in calmer periods,—that breaks into lyric fervor and melody, and that arouses kindred spirits with recital of its brave imaginings. Feeling of any kind is the touch upon the poet's electric keyboard; the *passio vera* of his more intense moods furnishes the impulse and the power for effective

speech. His emotion instinctively acquires the tone and diction fitted to its best expression. Even the passion of a hateful nature is not without a certain distinction. Flame is magnificent, though it feed upon the homes of men.

RIGHT here we stop to consider that thus far our discussion of the poetic elements applies with almost equal significance to all the fine arts; each of them, in fact, being a means of expressing the taste, thought, passion, imagination, and insight, of its devotee. The generic principles of one are those of all. Analysis of one is to this extent that of art as art: a remark illustrated by the talk of every noteworthy virtuoso, from Angelo to Reynolds and Ruskin and Taine. Reflect for an instant upon the simultaneous appearance of a certain phase, such as Preraphaelitism, in the plastic, structural, and decorative arts, in imaginative literature, and on the stage itself, and you see that the Muses are indeed sisters, and have the same food and garments—often the same diseases. But take for granted the "consensus of the arts." What is it, then, that differentiates them? Nothing so much as their respective vehicles of expression. The key-stone of our definition is the statement that poetry, in the concrete and as under consideration, is *language*. Words are its specific implements and substance. And art must be distinguished, whatsoever its spirit, by its concrete form. A picture of the mind is not a painting. There is a statue in every stone; but what matters it, if only the brooding sculptor sees it? A cataract, a sunset, a triumph, a poetic atmosphere, or mood, or effect—none of these is a poem. When Emerson and Miss Fuller went together to see Fanny Elssler dance, and the philosopher whispered to the sibyl, "Margaret, this is poetry!" and the sibyl rejoined, "Waldo, it is religion!" they both, I take it, would have confessed with Hosea that they had used similitudes. We are now considering the palpable results of inspiration. Poetry houses itself in *words*, sung, spoken, or inscribed, though there is a fine discrimination in the opening sentence of Ben Jonson's Grammar, which declares of language that "the writing [of it] is but an accident."

Language is colloquial and declarative in our ordinary speech, and on its legs for common use and movement. Only when it takes wings does it become poetry. As the poet, touched by emotion, rises to enthusiasm and imaginative power or skill, his speech grows *rhythmic*, and thus puts on the attribute that distinguishes it from every other mode of artistic expression—the gild-mark which, rightly considered, establishes the nature of the thing itself. At this date there is small need to descant upon the

universality of rhythm in all relations of force and matter, nor upon its inherent consonance with the lightest, the profoundest, sensations of the living soul. Let us accept the wisdom of our speculative age, which scrutinizes all phenomena and reaches the scientific bases of experience, and, looking from nadir to zenith, acknowledges a psychological impulse behind every physical function. The earliest observers saw that life was rhythmical, that man and brute are the subjects of recurrent touch, sensation, order, and are alike responsive to measured sound, the form of rhythm most obvious and recognizable; that music, for instance, affects the most diverse animate genera, from the voiceless insect and serpent to the bird with its semi-vocal melody, and the man whom it incites to speech and song. The ancients no less comprehended the rhythm of air and water, the multitudinous harmonies, complex and blended, of ocean surges and wind-swept pines. But our new empiricism, following where intuition leads the way, comprehends the function of *vibrations*: it perceives that every movement of matter, seized upon by universal force, is *vibratory*; that vibrations, and nothing else, convey through the body the look and voice of nature to the soul; that thus alone can one incarnate individuality address its fellow; that, to use old Bunyan's imagery, these vibrations knock at the ear-gate, and are visible to the eye-gate, and are sentient at the gates of touch of the living temple. The word describing their action is in evidence: they "thrill" the body, they thrill the soul, both of which respond with subjective, interblending vibrations, according to the keys, the wave-lengths, of their excitants.

Thus it is absolutely true that what Buxton Forman calls "idealized language," *i. e.*, speech which is imaginative and rhythmical, goes with emotional thought; and that words exert a mysterious and potent influence, thus chosen and assorted, beyond their normal meanings. Equally true it is that natural poets in sensitive moods have this gift of choice and rhythmic assortment, just as a singer is born with voice and ear, or a painter with a knack of drawing likenesses before he can read or write. It is not too much to say that if not born with this endowment he is not a poet: a poetic nature, if you choose,—indeed, often more good, pure, intellectual, even more sensitive, than another with the "gift,"—and, again, one who in time by practice may excel in rhythmical mechanism him that has the gift but slights it; nevertheless, over and over again, not a born poet, not of the royal breed that by warrant roam the sacred groves. I lay stress upon this, because, in an age of economics and physics and prose fiction, the fashion is to slight the special

distinction of poetry and to deprecate its supremacy by divine right, and to do this as our democracy reduces kingcraft—through extending its legitimate range. You cannot force artists, architects, musicians, to submit to such a process, for material dividing lines are too obvious. Otherwise, some would undoubtedly make the attempt. But poetic vibrations are impalpable to the carnal touch, and unseen by the bodily eye, so that every realist, according to his kind, either discredits them or lays claim to them. All the same, nothing ever has outrivalled or ever will outrival, as a declaration of the specific quality of poetry, the assertion that its makers do

Feed on thoughts, that *voluntary* move
Harmonious numbers;

and the minstrel poet, of my acceptance, "lisp'd in numbers" as an infant—and well does the hackneyed verse reiterate, "for the numbers came."

Aside from the vibratory mission of rhythm, its little staff of adjuvants, by the very discipline and limitations which they impose, take poetry out of the place of common speech, and make it an art which lifts the hearer to its own unusual key. Schiller writes to Goethe that "Rhythm, in a dramatic work, treats all characters and all situations according to one law. . . . In this manner it forms the atmosphere for the poetic creation. The more material part is left out, for only what is spiritual can be borne by this thin element." In real, that is, spontaneous minstrelsy, the fittest assonance, consonance, time, even rhyme,—if rhyme be invoked, and rhyme has been aptly called "both a memory and a hope,"—come of themselves with the imaginative thought. The soul may conceive unconsciously, and, as I believe in spite of certain metaphysicians, without the use of language; but the moment the wire is put up, the true and only words are flashed along it. Such is the test of genuineness, the underlying principle being that the masterful words of all poetic tongues are for the most part in both their open and consonantal sounds related to their meanings, so that with the inarticulate rhythm of impassioned thought we have a correspondent verbal rhythm for its vehicle. The whole range of poetry which is vital, from the Hebrew psalms and prophecies, in their original text and in our great English version, to the Georgian lyrics and romances and the Victorian idyls, confirms the statement of Mill that "the deeper the feeling, the more characteristic and decided the rhythm." The rapture of the poet governs the tone and accent of his

High and passionate thoughts
To their own music chanted.

Whoever, then, chooses to exempt poetry from this affinity with rhythm is not considering the subject-matter of these discourses. Not that I would magnify its office, or lessen the claims of other forms of imaginative and emotional expression. "The glory of the celestial is one, and the glory of the terrestrial is another . . . there is one glory of the sun, and another glory of the moon." Nor do I ask you, with the Scripture, to set one above the other: count them of equal rank, if you like,—as in truth they seem to be in a time which has produced not only "In Memoriam," "Pippa Passes," "The Problem," but also the "Tale of Two Cities," "Henry Esmond," "The Scarlet Letter,"—but count them as *different*. Of one thing I am assured, that every recognized poet will claim the vitality of this difference—a professional claim, without doubt, but not as though made by a lawyer or a divine, since their professions are more arbitrary and acquired. I confess that natural aptitude justifies in a measure the expressions "a born lawyer," "a born doctor," etc.; still, more of what we call professional skill is obtained by training than by derivation. The reverse of this is true of minstrelsy, and thus it chances that for a thousand excellent lawyers you shall not discover one superior poet.

It is not essential now, when the trick of making clever verse is practised, like all the minor technics of decoration, music, and so on, by many more or less cultured persons with a talent for mimicry, to discuss historic forms of measure, and to show why rhythm is not confined to any formal measures rhymed or unrhymed. Yet even rhyme, in our tongue, has advantages apart from its sound, when so affluent and strong a workman as Browning uses it in some of his most extended poems as a brake on the whirl and rush of an over-productive genius. All the varied potencies of rhythm,—its trinity of time-beat, consonance, and assonance, its repetends and refrains and accidental wandering melodies and surprises,—are the vibrations of the poetic fervor made manifest, and the poet's conveyance of it to his listeners.

Now, we have seen that the term poetry was long applied to all imaginative literature. I recognize the fact that the portion of it which was only germinal with the ancients, but is the chief characteristic of our modern age, the prose tale or romance—that this, our prose fiction, is equally a part of the feigned history celebrated by Plato and Bacon and Sidney, of the thing creatively invented rather than of things debated or recorded. It is often imbued with the true spirit of poesy, and is almost always more original in plot, narrative, structure, than its sister art. It well may supply the topic

for a series of discourses. Among the brilliant romancers and novelists are not a few who, were not fiction the dominant mode of our time, would possibly have wreaked their thoughts upon expression in rhythmical form. But to see how distinct a thing it is, and also to illustrate my belief that a dramatic poet may as well not originate his own narrative or plot, read a story of Boccaccio or a chronicle by Holinshed, and then the play of Shakspeare's molded upon it. The masterly novelist, the better to control his plot and to reflect life as it is, keeps his personal emotion within such command that it fails to become rhythmical. Where it gets the better of him, and he breaks into blank verse or singsong, his work is infallibly weakened; it may catch the vulgar ear, but is distinctly the less enduring. Who now can abide the tricky metrical flow of certain sentimental passages in Dickens? And Dickens, by the way,—nature's own child and marvelous, as in truth he was,—occasionally set himself to write poetic verse, but he knew no trick of it, and could acquire none. His lyrics were mostly commonplace. This was to be expected, for a real poet usually writes good prose, and rarely rhythmical prose as prose, though he may elect, with Macpherson, Blake, Tourgénéieff, Emerson, and Whitman, to cast his poetry in rhythmical prose form. Thackeray, who was a charming poet, of a light but distinct quality above which he was too genuine to venture, put no metrics into his novels. See how definite the line between the prose and verse of Milton, Goethe, Landor, Coleridge, Byron. Of Emerson I have said elsewhere that his prose was poetry, and his poetry light and air. There is a class of writers, of much account in their day, whose native or purposed confusion between rhythmical and true prose attracts by its glamor, and whom their own generation, at least, can ill spare. Of such was Richter, and such in a measure have been De Quincey, Wilson, Carlyle, and even Ruskin, each after his kind. The strong personality of a writer forces its way. But it is to be noted that these after a time fall into distrust, as if the lasting element of true art had somehow escaped them. Certain latter-day lights well might take a lesson from the past. These illuminati leave firm ground, but do they rise to the upper air? There is something eery and unsubstantial about them as they flit in a moonlit limbo between earth and sky. Howbeit, they are what they are, and may safely plead that it is more to be what they can be than not to be at all. The difference betwixt poetical prose and the prose of a poet is exemplified by Mark Pattison's citation of the two at their best—the prose of Jeremy Taylor and that of Milton, the former "loaded with

imagery on the outside," but the latter "colored by imagination from within."

In short, although throughout our survey, and especially in the Orient, the most imaginative poetry often chants itself in rhythmic prose, the less rhythm there is in the prose of an essayist or novelist the better, even though it characterizes an interlude. As a drop of prosaic feeling is said to precipitate a whole poem, so a drop of sentimental rhythm will bring a limpid tale or essay to cloudy effervescence. As for eloquence, also classed with poetry by our ancestors, and which is subjective and passionate, I do not say that it may not rise by borrowing wings; but in a poem the force of eloquence pure and simple cannot be prolonged without lessening ideality and the subtle quality of all, — suggestiveness, — and rhetoric is as false a note as didacticism in the poet's fantasia.

It is worth while to observe, in passing, that there never was a time before our own in literary history when more apparent successes, more curious and entertaining works, were achieved by determined and sincere aspirants who enter, not through original bent, but under gradual training and "of malice aforethought," fields to which they are not born inheritors—the joint domains of poetry and prose fiction. Their output deceives even the critic, because it does serve a purpose, until he reflects that none of it is really a force—really something new, originaive, enduring. Such a force was that of Fielding, of Byron, of Scott, of Keats, of Wordsworth, of Browning; and many lesser but fresh and natural poets and novelists are forces in their several degrees. What they produce, from its individual, often revolutionary, quality, is an actual addition to literature. But we see natural critics and moralists, persons of learning, of high cultivation in the focal centers of literary activity, who develop what *is* inborn with them—an exquisite gift of appreciation, and in time a stalwart purpose to rival the poets and novelists on their own ground. This they undertake at that mature age when the taste and judgment are fully ripe, and after admirable service as scholars, essayists, and the like. Now, there scarcely is an instance, in the past, of a notable poet or romancer who did not begin, however late, by producing poetry or fiction, however crude, and this whether or not he afterward made excursions into the fields of analysis or history or esthetics. Mr. Howells is a living illustration of this natural process. He began as a poet, and then, after excursions into various literary fields that displayed his humor, taste, and picturesqueness, he caught the temper of his period as a novelist, and helped to lead it. The cleverness and occasional "hits" of many self-elected poets and tale-writers are, however,

noteworthy, even bewildering. At this moment those who command public attention and what is called the professional market have previously demonstrated that their natural bent was that of didactic and analytic, rather than of emotional and creative, writers. Their success has been a triumph of culture, intellect, and will power. These instances, as I have said of an eminent poet and essayist now no more, almost falsify the adage that a poet is born, not made. Still, we bear in mind that precisely analogous conditions obtain in the cognate artistic professions—in painting, music, architecture. The poets and novelists by cultivation, despite their apparent vogue in the most extended literary market the world has ever seen, and ambitious as their work may be, lack, in my opinion, the one thing needful to create a permanent force in the arts, and that is the predestined call by nature and certain particles of her "sacred fire."

We need not enter the poet's workshop and analyze the physics and philosophy controlling the strings of his lyre. That a philosophical law underlies each cadence, every structural arrangement, should be known in this very spot, if anywhere, where not alone the metrics and phonetics, and what has been called the rationale, of verse, but therewithal the spirit of the poetry of the East, of our classical antiquity, of the Romance tongues, of the Norse, and of our own composite era, are in the air, one may say, are debated with a learning and enthusiasm for which a few of us, in my own academic days, hungered in vain. Here, too, it was that the most analytic treatise ever conceived, upon the technics of rhythmical effect, was written by your own poet, Lanier, for whom the sister-spirits of Music and Poesy contended with a rivalry as strong as that between "twin daughters of one race," both loving, and both worshiped by, one whom death too soon removed while he strove to perfect their reconciliation. Though poetry must come by the first intention, if at all, and inspiration laughs at technical processes, even the unlettered minstrel conforms to law, as little conscious of it as some vireo in the bush is conscious of the score by which a Burroughs or an Olive Miller transfers the songster's *tirra-lirra* to the written page. The point remains that poetry is ideal expression through words, and that words are not poetry unless they reach a stress that is rhythmical. Painting is a mode of expression, being visible color and shadow distributed upon a material surface; the language of poetry is another mode, because it is *articulate* thought and feeling. Sidney pointed merely to the fact that rhythm is not confined to verse, when he spoke of "apparelled verse" as "an ornament, and no cause to poetry, since there have been many

most excellent poets that never have versified"; and he added that "now swarm many versifiers that need never answer to the name of poet." Wordsworth's familiar recognition of "the poets that ne'er have penned their inspiration" was a just surmise; but such a poet is one *in posse*, assuredly not *in esse*, not a maker. Swinburne traverses the passage with a bit of common sense—"There is no such thing as a dumb poet or a handless painter. The essence of an artist is that he should be articulate."

SUBMITTING these views with respect to a scientific definition of poetry, I ask your attention to a brief consideration of its bounds and liberties, as compared with those of music and the respective arts of design.

The specific province, by limitation, of Sculpture, the art consecrated to the antique precision of repose, is to express ideals of form arrested as to movement and time. Its beauteous or heroic attitudes are caught at the one fit moment, and forever transfixed in rigid stone or wood or metal. Painting has an additional limitation; it gives only the similitude of form in all its dimensions, and only from one point of a beholder's view. To offset this, the range of the painter is marvelously broadened by the truth of perspective, the magic and vital potency of color, the tremulous life of atmosphere, and the infinite gradations and contrasts of light and shade. The mystical warmth and force of the Christian humanities are radiant in this enrapturing art. Yet its office is to capture the one ideal moment, the lifelong desire of Faust, and to force it to obey the mandate

Ah, still delay — thou art so fair !

Such are the arts addressed to the eye alone, both of them lending their service to the earliest, the latest, the most various, of all material constructions — Architecture, whose pediments and roofs and walls originate in our bodily necessities, whose pinnacles typify our worship and aspiration, and which so soon becomes the beneficiary and the incasement of its decorative allies. None of the three can directly express time or movement, but there is practically no limit to their voiceless representation of space and multitude.

But movement in time is a special function of Music, that heavenly maid, never so young as now, and still the sovereign of the passions, reaching and rousing the soul through sound-vibrations perpetually changing as they flow. To this it adds the sympathetic force of harmonic counterpoint. Its range, then, is freer than that of the plastic and structural arts, by this element of progressive change. Under its spell, thrilling with the sensations which it can excite, and which really are immanent in our

own natures, considering moreover the superb mathematics of its harmony, and again that it has been the last in development of all these arts, we question whether it is not only superior to them but even to that one to which these lectures are devoted. All feel, at least, the force of Poe's avowal that music and poetry at their highest must go together, because "in music the soul most nearly attains the great end for which it struggles — supernal beauty." And so old John Davies, in praise of music, —

The motion which the ninefold sacred quire
Of angels make: the bliss of all the blest,
Which (next the Highest) most fills the highest
desire.

Schopenhauer thought that the musician, because there is no sound in nature fit to give him more than a suggestion for a model, "approaches the original sources of existence more closely than all other artists, nay, even than nature herself." Herbert Spencer has suggested that music may take rank as the highest of the fine arts, as the chief medium of sympathy, enabling us to partake the feeling which excites it, and "as an aid to the achievement of that higher happiness which it indistinctly shadows forth." And in truth, if the intercourse of a higher existence is to be effected through sound-vibrations rather than through the swifter light-waves, or by means of aught save the absolute, celestial insight, one may fondly conceive music to be the language of the earth-freed, as of those imagined seraphim with whom feeling is "deeper than all thought."

Consider, on the other hand, how feeling governs the simple child, "that lightly draws its breath," while thought begins its office as the child grows in strength and knowledge, and it is a fair inference that thought is the higher attribute, and that the suggestion of emotion by music is a less vital art than that of intellectual speech. The dumb brutes partake far more of man's emotion than of our mental intelligence. Neither is music, despite our latter-day theorists who defy the argument of Lessing's Laocoön and would make one art usurp the province of another, and despite its power as an indirect incentive to thought by rousing the emotions, a vehicle for the conveyance of precise and varied ideas. The clearer the idea, the more exact the language which utters and interprets it. This, then, is the obvious limitation of music: it can traverse a range of feeling that may govern the tone of the hearer's contemplations, it can "fill all the stops of life with tuneful breath" and prolong their harmonic intervals indefinitely, but the domain of absolute thought, while richer and more imperial for its excitation, is not mastered by it. Of that realm music can make no exact chart.

Thus far, we have no art without its special office, and none that is not wanting in some capacity displayed by one or more of the rest. Each goes upon its appointed way. Now comes poetry,—rhythmical, creative language, compact of beauty, imagination, passion, truth,—in no wise related, like the plastic arts, to material substance; less able than its associate, music, to move the soul with those dying falls of sound that increase and lessen thought and the power to harbor it; almost a voiceless spirit of invention, working without hands, yet the more subtle, potent, inclusive, for this evasive ideality, and for creations that are impalpable except through the arbitrary and non-essential symbols by which it now addresses itself to the educated eye.

Permit me to select, almost at random, from Keats and Tennyson, ready illustrations of the bounds and capabilities of the various arts—passages necessarily familiar, since they are from Keats and Tennyson, but chosen from those masters because, of all English poets since Spenser, they are most given to picture-making, to the craft that is, as we say, artistic, picturesque. A stanza from the "Ode on a Grecian Urn" describes, and rivals in verse, the ravishing power of a bit of sculpture to perpetuate arrested form and attitude—yes, even the suggestion of arrested music:

Heard melodies are sweet, but those unheard
Are sweeter; therefore, ye soft pipes, play on—
Not to the sensual ear, but, more endear'd,
Pipe to the spirit ditties of no tone.
Fair youth, beneath the trees, thou canst not leave
Thy song, nor ever can those trees be bare;
Bold lover, never, never canst thou kiss,
Though winning near the goal; yet, do not
grieve —
She cannot fade, though thou hast not thy bliss;
Forever wilt thou love, and she be fair.

These undying lines not only define by words the power and limits of the sculptor, but are almost a matchless example of the farthest encroachment poetry can make upon sculpture's own province. What it cannot do is to combine the details of the carving so as to produce them to the mind, as sculpture does to the eye, at a single instant of time. It lingers exquisitely upon each in succession. Progressive time is required for its inclusion of the effects of a Grecian frieze or scroll. Now, take from Tennyson's lovely but lighter poem, "The Day-Dream,"—a lyrical idyl at the acme of melodious and fanciful picture-making,—a stanza which seems to match with a certain roundness and color the transfixing effect of the painter's handiwork. It portrays a group entranced by the spell that has doomed to a hundred years of abeyance and motionlessness the life of the king's palace and the Sleeping Beauty.

In the poems of Keats and Tennyson, as I say, artists find their sculptures and paintings already designed for them, so that these poets are the easiest of all to illustrate with some measure of adequacy. The theme of the following lines, rendered by a painter, would show the whole group and scene at a flash of the eye; poetry cannot do this, yet the listener has painted it all in his mind when the last word is uttered:

More like a picture seemeth all
Than those old portraits of old kings,
That watch the sleepers from the wall.

Here sits the butler with a flask
Between his knees, half-drain'd; and there
The wrinkled steward at his task,
The maid-of-honor blooming fair;
The page has caught her hand in his:
Her lips are sever'd as to speak:
His own are pouted to a kiss:
The blush is fix'd upon her cheek.

It is to be noted, as we read, that Tennyson's personages, and those of Keats as well, are mostly conventional figures, as characterless as those on a piece of tapestry. The genius of neither poet is preferably dramatic: they do not get at individuality by dramatic insight like Shakspeare, nor by monodramatic soliloquy and analysis, like the strenuous Browning. Their dramas are for the most part masques containing *eidullia* (little pictures)—though who can doubt that Keats, had he lived, would have developed the highest dramatic power? Remember what the less sensuous, more lyrical Shelley achieved in "The Cenci," when only four years beyond the age at which Keats imagined his "gold Hyperion, love-lorn Porphyro." But, to resume, see what poetry, in addition to the foregoing counterfeit of the painter's ocular presentment, can bring about in its own field through its faculty of movement in time—a power entirely wanting to the arts which it has just mimicked. Note how it breaks the spell of transfixed attitude, of breathless color and suspended action; how it lets loose the torrents of Life at the instant of the "fated fairy prince's" experimental kiss:

A touch, a kiss! the charm was snapt.
There rose a noise of striking clocks,
And feet that ran, and doors that clapt,
And barking dogs, and crowing cocks;
A fuller light illumined all,
A breeze thro' all the garden swept,
A sudden hubbub shook the hall,
And sixty feet the fountain leapt.

The maid and page renew'd their strife,
The palace bang'd, and buzz'd, and clackt,
And all the long-pent stream of life
Dash'd downward in a cataract.

That is the stream which the painter has no art to undam. Only by a succession of pictures can he suggest its motion or follow the romance to its sequel; and that he can do even this with some fitness in the case of a Tennysonian ballad is because the laureate, as we see, counterfeits the painter's own method more artistically than other idyllists of rank in our time. If art is the fit and beautiful conformation of matter infused with the spirit of man, it must indeed have life. The most nimble, ardent, varied transfer of the vital spirit is by means of language, and of all language that of the poet is the most alive and expressive. Observe, again, that in what are called art circles—Arcadian groups of those devoted to art and letters—the imaginative writers are apt to interest themselves far more with respect to the plastic arts than the sculptors and painters with respect to poetry and romance; and well they may, since the poet enriches his work by using all artistic effects, while nothing is more dangerous to a painter, for example, than that he should give his picture a literary cast, as the phrase is, and make it too closely tell a story or rehearse a poem. This of itself tends to confirm Lessing's apothegm that "the poet is as far beyond the painter as life is better than a picture."

THE conquests of poetry, in fine, are those of pure intelligence and of emotion that is unfettered. Like the higher mathematics, it is not dependent on diagrams, for the mind to which it appeals is a responsive draughtsman of lines finer and more complex than any known to brush or graver. It creates no beauty of form beyond the accidental symbols grouped in script and print, none of light and color, while the ear is less touched by it than by the melodies or harmonies of music; for its melody is that of flexible speech, and it knows not counter-

point, but must resort to the value of successive strains. Yet we say that it has form and outline of its own, an architecture of its own, its own warmth and color, and, like music, life, and withal no little of music's vocal charm, in that through words it idealizes these "sweet influences," and is chartered to convey them all to the inward sight, the spiritual hearing, of the citadeled soul, with so apt suggestion that the poet's fellow-mortals, of like passions and perceptions with himself, see and hear and feel with much of his distinct individuality. Its vibrations excite the reflex action that creates in the mind of the receiver a vision corresponding to the imagination of the poet. Here is its specific eminence: it enables common mortals to think as the poet thinks, to use his wings, move through space and time, and out of space and time, untrammelled as the soul itself; it can feel, moan, weep, laugh, be eloquent, love, hate, aspire, for all—and with its maker; can reflect, and know, and ever seek for knowledge; can portray all times and seasons, and describe, express, interpret, the hiddenmost nature of man. Through poetry soul addresses soul without hindrance, by the direct medium of speech. Words are its atmosphere and very being: language, which raises man above the speechless intelligences; which, with resources of pitch, cadence, time, tone, and universal rhythm, is in a sense a more advanced and complex music than music itself—that idealized language which, as it ever has been the earliest form of emotional expression, appears almost a gift captured in man's infancy from some "imperial palace whence he came." To the true poet, then, we say, like the bard to Israfel:

The ecstasies above
With thy burning measures suit—
Thy grief, thy joy, thy hate, thy love,
With the fervor of thy lute—
Well may the stars be mute.

Edmund Clarence Stedman.

COME LOVE OR DEATH.

O LIFTED face of mute appeal!
Poor tongueless pantomime of prayer!
O sullen sea, whose deeps conceal
The children of despair!
O heart that will not look above!
Poor staggering feet that seek the wave!
I would come quick, if I were Love,
And I had power to save.

O sinking sunset loneliness
Aflame in hot, unmoving eyes!
Poor wan lips, creeping in distress
To cover up your cries!
O broken speech, and sobbing breath!
Poor restless and uncertain will!
I would come quick, if I were Death,
And I had power to kill!

Will H. Thompson.

THE MOTHER AND BIRTHPLACE OF WASHINGTON.

DESIGNED BY CHARLES C. PERKINS.

PROPOSED MEMORIAL TO BE ERECTED BY THE GOVERNMENT TO MARK THE BIRTHPLACE OF WASHINGTON.

IN Lancaster County, Virginia, on the left bank of the Rapahannock River, where its tide broadens before blending with beautiful Chesapeake Bay, stood Epping Forest, which, nearly two centuries ago, was the plantation home of Colonel Joseph Ball. There, in the latter months of the year of grace 1706, was born his youngest child, Mary. The baby came of brave and sturdy British stock. Her English grandfather, Colonel William Ball, a Royalist, emigrated to America in 1657, and settled upon a plantation called Millenbeck, in the parish of St. Mary's, Lancaster County, Virginia. The name Ball is mentioned first in the "Doomsday Book of Exon" some time in the thirteenth century. The scutcheon of the family is described in Burke's Armory, its crest thus: "Out of a ducal coronet a hand and arm, embowered in mail, grasping a fire ball — all proper."

That the Balls were alike faithful to Church and state is set forth in Bishop Meade's book, "Old Churches, Ministers, and Families of Virginia," which also mentions that Major James Ball and Colonel Joseph Ball were allowed to finish a private gallery for the use of their families, themselves meeting the expense, while White Chapel¹ was rebuilding.

A number of these historic colonial churches

¹ Chapel of Ease to Old Christ Church, Lancaster County, Virginia.

still remain, some in an excellent state of preservation, others in ruins, with their silent congregations gathered around them under the solemn shade of noble pine- and cedar-trees, notably at White Chapel, where many time-worn tombstones remain almost hidden in wild grass, but bearing uneffaced upon the lichened marble the names and brave records of the Balls.

Under the old régime in Virginia estates were entailed as in the mother-country, and the life of the planters was dignified and aristocratic, and also rather isolated, while of the lives of the women we find few records beyond those of birth, marriage, and death.

Scant data are left of Mary Ball's childhood and youth at Epping Forest. Her name occurs in a legal document of the 25th of June, 1711, when her father, smitten with sore sickness, and, as he states, "lying upon the bed in his lodging-chamber, maketh his last will and testament, commending his soul to God with sound and disposing mind," carefully arranges the settlement of a large estate, real and personal, for the benefit of his family.

Only a single extract can be given from this lengthy document with its profuse legal phraseology. Having made liberal provision for his wife, the testator makes a special bequest to their youngest child thus: "Item,— I give and bequeath unto my daughter Mary 400 acres of land in Richmond County in y^e freshes of Rappa-h'n River, being a part of a pattern of 1600 acres, to her, y^e said Mary, and her heirs forever."

From the time of her husband's death Colonel Ball's widow lived many years, which were undoubtedly devoted to careful training of her child, fitting her, as it proved, to pass with rare firmness and fortitude through the trials and vicissitudes that later life laid upon her.

Few of Mary Ball's letters remain; it is probable that few were written. The handwriting is stiff and cramped, the spelling is bad, but they are most sensibly and earnestly expressed. Only one letter of her girlhood is known; it was written at seventeen to her half-brother Joseph, in England, and says, among other things, "We have not had a schoolmaster in our neighborhood until now in nearly four years." In the Virginia of that day of course no public schools existed, and few tutors were available, except when the rector of the parish consented to perform that function.

Augustine Washington and Mary Ball was Married the
Sixth of March, 17³⁰/₃₁

about 12 a clock at Noon Aged 1 Year & 4 Months

Augustine Washington Departed this life of 12th Day of April 174.
Aged 49 Years —

FACSIMILE OF THE RECORD IN THE FAMILY BIBLE OF AUGUSTINE AND MARY WASHINGTON.

She is described with charming quaintness in a fragmentary letter that was found during the war in one of the desolated houses near Yorktown, Virginia. Under date of "W^mburg, y^e 7th day of Oct., 1722," the letter-writer says:

Madame Ball of Lancaster and her sweet Molly have gone Hom. Mamma thinks Molly the Comliest Maiden She Knows. She is about 16 y^r old, is taller than Me, is verry Sensable, Modest, and Loving. Her Hair is like unto Flax. Her eyes are the color of Yours, and her cheeks are like May Blossoms.

From the time of this visit to Williamsburg, years follow of which no record is left until some time in 1728, when it befell that her mother died. But before Mistress Ball's eyes closed she had seen her daughter bloom from the "sweet Molly" of sixteen into a lovely young woman of twenty-two, who was termed, in the flowery language of that day's local romance, "The Rose of Epping Forest," and is mentioned by Sparks and Irving as "the belle and beauty of the Northern Neck," as that section of the Virginia low country to which

Lancaster County belonged was commonly called.

A fragment of another old letter, written about this time, says, "I understand Molly Ball is going Home with her Brother, a Lawyer who lives in England"; but of this proposed visit there is left neither record nor tradition of any kind among her personal descendants, though Dr. Lossing considers it possible that the visit was made and that in England she met and married Augustine Washington. The record of her marriage upon the page of the old and much-worn family Bible gives the date 1730. The volume is a most quaintly illustrated quarto; time and age have turned the paper to a pale yellow-brown, but the handwriting of the very brief and simple entry is quite distinct and clear.

Augustine Washington and Mary Ball was married the sixth of March 1730-31.

This Bible has been a hereditary relic in the writer's family for five generations, having been given by Mary Ball Washington to her only daughter Betty, Mrs. Fielding Lewis, and transmitted directly to her descendants. The scribe in the old Bible has given no other detail of the event, not even whether it took place in church or at home.

That the bride was blonde and beautiful both history and tradition tell, and of the bridegroom in his fortieth year a description has been transmitted from one generation to another. Mary Washington's description of her husband is confirmed by the testimony of contemporaries—a noble-looking man, of distinguished bearing, tall and athletic, with fair, florid complexion, brown hair, and fine gray eyes.

Something more is due to the father of Washington than mere mention of his personal appearance; but space allows us only to refer the investigating reader to careful reviews of Washington's ancestry given in Sparks's and Irving's histories, tracing the family for six centuries in England, and further, to a grant of land recorded in 963 from Edgar the Saxon King to "Athelunold Was-sengatone."¹

Returning to Mary Ball's marriage and the query who was her husband, nothing could be more emphatic than his own solemn assertion, made in the first sentence of his last will, "I, Augustine Washington of the county of King George, Gentleman."

The bridegroom's home at this time was in

Westmoreland County, on the Potomac. The house, built in pioneer days, was small but substantial, the main building hip-roofed, with dormer-windows, and a one-story wing running back, which was used as a chamber; in this room, family tradition tells us, George Washington was born. The long side of the house fronted the river, which was, and is, about three hundred and fifty feet distant. The bank is about fifteen feet high, with, at this date, a depth of water at its base averaging five feet; and here it was that vessels from Europe came laden with supplies for the Washingtons, and, returning, bore away with them the products of the Wakefield and Haywood plantations.²

Around the mansion were the fine fields of its owner's broad domain, extending for a mile, and skirted on one side by the Potomac. There was full measure of content in this abode where the first years of Mary Washington's wedded life were spent, made perfect when, as the old Bible tells us, George Washington, son of Augustine and Mary his wife, was born "y^e 11th day of February, 1731-2, about 10 in the morning, and," the record goes on to say, "was baptized the 3d day of April following, Mr. Beverley Whiting and Captain Christopher Brooks, Godfathers, and Mrs. Mildred Gregory, Godmother."³

Other children came in rapid succession. They were Betty, Samuel, John Augustine, Charles, and Mildred, who died in infancy. The second son, Samuel, was born in November, 1734, and in the following spring, while the servants, preparing for the planting of early crops, were burning the accumulated "trash," the mansion took fire and was burned to the ground. For many years a massive chimney remained standing; it was generally supposed to have belonged to the original house, but is stated by the oldest living members of the family to have been part of an outhouse that stood hard by the mansion and has been wrongly pictured in histories as the birthplace of Washington.

When the Wakefield estate was sold many years ago by one of the Washingtons to another of the name, a reservation was made of the spot where the house had stood, and in 1858 this reservation was presented to the State by its hereditary owner, the late Colonel Lewis W. Washington of Virginia, conditional upon the place being inclosed, and a fitting monument erected upon it properly inscribed as the birthplace of Washington.

Recently Congress passed a bill appropriat-

aunt of the infant. She was the daughter of Lawrence Washington, brother of Augustine. Mildred Washington married Roger Gregory of King and Queen County, Virginia, and after his death was married to Colonel Thornton of Fredericksburg.

¹ Volume I, *Chronicon Monasterie de Abingdon*, published by the British government.

ing thirty thousand dollars to erect a monument upon Washington's birthplace, and while the Hon. William M. Evarts was Secretary of State much interest was excited. He visited the spot, and Colonel Casey, chief engineer, made a careful survey of the site. Subsequently, under instructions of the State Department, the foundation of the house was traced and uncovered. There is an old water-color picture now hanging in the west room at Mount Vernon, for several generations an heirloom in one branch of the Washington family, which, tradition tells, represents the old Wakefield house where George Washington was born.

The place to which Augustine Washington removed in 1735 was known to his Lewis grandchildren, who subsequently inherited it, as Pine Grove; it was also called Ferry Farm, from the adjacent ferry over the Rappahannock. The house was small, and stood upon a bank above the river, surrounded by fine orchards, garden, and shrubberies. The Washingtons with their children were regular attendants at the Episcopal church in Overwharton Parish, where their home was situated; and here one Master Hobby, a pompous person of enormous self-esteem, who combined the vocation of sexton with that of schoolmaster, earned a post-mortem fame as the first instructor of George Washington.

Eight years passed serenely, when suddenly

Mary Washington's great sorrow came. Early in April her husband, riding one day over his plantation, was caught in a rain-storm; he took cold, and after a brief illness died of rheumatic gout. The record in the old Bible tells us tersely, "Augustine Washington Departed this life y^e 12th day of April, 1740, aged 49 years." His remains were taken back to his birthplace on the Potomac, and entombed in the family vault. One clause of his will is a little curious: "It is my Will and desire that my said four sons' (George, Samuel, John, and Charles) estates may be kept in my wife's hands until they respectively attain the age of Twenty One years, *in case my said wife continues so long unmarried.*"

The provision in case of a second marriage proved unnecessary, for, though left a widow at thirty-seven, Mary Washington was loyal to her husband's memory and to his trust. And now, having to assume her husband's duties in addition to her own, no time for sorrowful brooding was permitted to the widowed mother, upon whom the management of her own and her children's properties devolved; for Augustine Washington bequeathed landed estates to each of his young sons, and made an especial provision in sterling money for his only daughter Betty. The personal care and training of their children until majority were left solely to the mother, and of the result able historians have written that in these manifold duties she "ac-

quitted herself with great fidelity to her trust, and with entire success."

Three years passed, and her son George being now fourteen years old, Mrs. Washington's thoughts were seriously moved to the consideration of his future career. She consulted his eldest half-brother, Lawrence Washington, who had married and settled at Mount Vernon, and become a prominent county gentleman, after having served with distinction in the British navy. Recognizing the boy's decided military taste, Lawrence strongly advised that George should adopt the same profession and enter the navy, though his mother's anxious heart opposed the plan.

To this episode in Washington's career attention has been repeatedly called by many writers, who quote from a letter written by Joseph Ball, in England, to his sister Mary, in Virginia, who had taken counsel with him on the subject of her son's entering the navy. The reply is, that no preferment can be expected for him, as he has "no influence" to obtain it. This was a mistake, and against the probably hasty assertion put the historic fact that Lawrence Washington secured by his influence a commission for George in the British navy, and after his luggage had been put aboard a man-of-war lying in the Potomac, at the last moment, his mother, yielding to her fears, recalled her consent, and the obedient but sorely disappointed boy returned home. After this episode the mother gave over her beloved son much to his eldest brother's guidance, permitting him to live at Mount Vernon until two years later, when he was appointed to and accepted, at the age of sixteen, the office of public surveyor.

The well-known incident of the boy's killing his mother's favorite thoroughbred colt has probably given rise to the mythical hatchet story. In a daring effort to break and ride the fiery, untamed creature, it reared, and fell back dead. Afterward, in response to her remarks about the colt, George confessed his fault without extenuation; to which the mother replied, "I am sorry that my favorite colt is killed, but I am glad that my son always tells the truth."

The time soon came when the country was shaken by the French and Indian War, and again the mother's heart ached with anxiety, while he, eager to win his spurs, was preparing to join General Braddock. His strong sense of duty overcame the illogical protest of anxious maternal love. Answering her objections, he said: "The God to whom you commended me, madam, when I set out on a more perilous errand defended me from all harm, and I trust he will do so now. Do you not?" After this she could only commend him to God, and—wait. Rumors reaching her, after Braddock's

defeat, that he was killed, he wrote promptly assuring her of his safety, and in one of her few letters she writes at this time to her brother in London, "I have known a great deal of trouble since I saw you; there was no end to my trouble while George was in the army, but he has now given it up."

The first month of the year 1759 brought brighter days, for in January Colonel Washington was married to beautiful Martha Dandridge Custis, widow of Daniel Parke Custis, and brought his lovely bride to Mount Vernon the following spring, while the mother rejoiced in her son's happiness.

For nearly a decade from this time there is no special note of Mary Washington's life. In 1760 her only daughter Betty was married to Colonel Fielding Lewis of Gloucester County, who built for her an elegant house on the border of the village of Fredericksburg, that she might be near her mother.

In 1765 the passage of the Stamp Act startled the colonists from their dream of peace. Deeply moved as she was by the public agitation, keenly alive to its possibilities of peril to her sons, the prevailing excitement made no change in the routine of her duties. Directions to the overseer, supervision of the spinners' and weavers' work,—an important item, as the servants were clothed in the main from fabrics of home manufacture,—and the daily direction of the household, kept her constantly occupied. Typical of her force of character and her rigid discipline was the rebuke she administered to an overseer who, presumptuously departing from her directions, followed his own judgment upon some matter of work. When arraigned for the offense, he made the insolent reply, "Madam, in my judgment the work has been done to better advantage than if I had followed your directions." A withering flash of her eyes fell upon the offender, with the imperious question: "And, pray, who gave you the right to exercise any judgment in the matter? I command you, sir; there is nothing left for you but to obey." The overseer was dismissed at once, and tradition tells that afterward, relating his misfortune to his friends, he declared that when he "met the blue lightning of Madam Washington's glance he felt exactly as if he had been knocked down."

Before leaving home for the Continental Congress in Philadelphia, with a recognition of the deadly strife the nation was entering upon, and with tender forethought for his own aging mother, Washington induced her to leave the lonely country home and to remove to Fredericksburg. Mistress Lewis and her husband urged that she should come to live with them in their beautiful home overlooking the town, but her answer to their loving insistence was

FROM THE PAINTING IN THE LEWIS FAMILY PLACE AT MARMION, VIRGINIA, ATTRIBUTED TO JOHN SINGLETON COPLEY.

BETTY, WASHINGTON'S ONLY SISTER.

tender yet firm: "I thank you for your dutiful and affectionate offer, but my wants are few in this life, and I feel perfectly competent to take care of myself." She selected a house of good size on Charles street. There were stables and an orchard in the rear, and a garden, redolent in their season with lilacs, calycanthus, flowering almond, hyacinths, cowslips, and other flowers. This garden was her favorite resort. Washington's solicitude for his mother's comfort was not satisfied until he had assisted in her removal and seen her comfortably settled in the new home.

Some of its furnishings may be gathered from the items of her will, which states that she is disposing of what "remains of her worldly estate." Numerous beds, bedsteads, counterpanes, curtains, and quilts; dressing-glasses, looking-glasses,—probably parlor mirrors,—silver tablespoons and teaspoons, "square dining-table," sets of china, "blue and white" and "red and white," are itemized. "Six red leather chairs," an "oval table," and her "walnut writing-desk with drawers," are also mentioned.

There was also a mahogany sideboard, given shortly before her death to her daughter for her young grandson Robert. The writer's mother well remembered it; but in the settlement of Major Robert Lewis's estate it was sold in the sale of personal property. The value of such relics was not realized then as now. The equipages mentioned in her will are a "phaëton and bay horse," also her "riding-chair, and two black horses"; so the stable was amply supplied. The number of attendants upon the mistress of this comfortable establishment formed quite an array for one person's needs; but in that day a retinue of domestics was required by every Southern lady.

The housekeeper, Mrs. Skelton, an active young woman, had general charge under the mistress's directions, and three colored servants, Patty, who held high dignity as "maid" to her lady, Bet, or Betsey, the cook, and her husband Stephen, coachman, sometimes gardener, with their two children, who had occasional duties between house and kitchen, completed the household.

FROM A PHOTOGRAPH BY W. G. TURNER, RETOUCED BY A. BRENNAN.
PRESENT APPEARANCE OF THE HOUSE OF WASHINGTON'S MOTHER AT FREDERICKSBURG, VIRGINIA.

This house, where Washington's mother passed her declining years, still stands in Fredericksburg, Virginia, but not in its original form, one end having been altered and the roof raised to give a full second story, which destroyed its former quaintness of aspect.

During the trying years when her son was leading the Continental forces the mother was watching and praying, following him with anxious eyes; but to the messengers who brought tidings, whether of victory or defeat, she turned a calm face, whatever tremor of feeling it might mask, and to her daughter she said, chiding her for undue excitement, "The sister of the commanding general should be an example of fortitude and faith." At last Fredericksburg was thrilled with the glad tidings of the victory at Trenton. Friends flocked to her with congratulations, and when the principal citizens waited upon her to express their gratitude and pride in the nation's hero, she gently answered, "George seems to have deserved well of his country"; and when they read letters eulogizing his skill and courage, she said, smiling, "Gentlemen, here is too much flattery; still, George will not forget the lessons I have taught him—he will not forget himself, though he is an object of so much praise."

The following years were anxious and trou-

bled ones, with few lights amid their shadows; but she never swerved from the systematic daily routine, and in good weather took frequent drives to her country-place in Stafford, making an impressive appearance in progress, said the grandson from whose personal recollections these facts are given. Her favorite conveyance, imported from London, was a "park phaëton," so called. It was low, without a top, and resembled a Windsor chair, with the difference that it had a seat in front for the driver and two seats within; it was an easy step from the ground, and had a somewhat straight back of perpendicular rounds. Her coachman, Stephen, was a tall, elderly colored man, full of pompous pride and dignity. On these excursions into the country, in summer she wore a dark straw hat with broad brim and low crown, tied down under the chin with black ribbon strings; but in winter a warm hood was substituted, and she was wrapped in the "purple cloth cloak lined with shag" that is described in the bequests of her will. In her hand she carried her gold-headed cane, which feeble health now rendered necessary as a support, and, as my grandfather and Mr. Custis stated, "When passing through the streets of Fredericksburg in this unostentatious manner, her progress became an ovation, for every one, from the gray-

haired old man to the thoughtless boy, lifted his hat to the mother of Washington."

Her systematic exactness in business was a distinguishing trait, and even when her health and strength failed under the weight of age and infirmity, the spirit was still strong and steadfast. When her son-in-law, Colonel Lewis, desiring to relieve her of business cares, offered to take the supervision of them, he received the resolute reply, "Do you, Fielding, keep my books in order, for your eyesight is better than mine; but leave the management of the farm to me."

The experiences of these years must have been deeply felt by Washington's mother: but whatever the tension of thought, there was no change of demeanor, while she dispensed a large though simple hospitality to the friends who gathered around her from far and near; and though her means were limited, her charities were wide and generous. There was something of nervous energy in her constant occupation, knitting-needles ever flying in the nimble fingers; for with her daughter and their domestics to aid, dozens of socks were knitted and sent to the General at camp for distribution, to-

walked over in the morning to spend the day, followed by her handmaid Patty, whose turban handkerchief towered in a toploftical structure, carrying with her an extra wrap and the little basket of needlework or knitting for her mistress, who usually ordered Stephen to come in the evening with the chaise to fetch her home.

Accustomed to exercise, admiring nature's beauties, she loved to go into the open and enjoy them, and retained to a remarkable degree her strength and activity. In their grandmother's walks the young Lewises were often her companions, forming in their early years a sort of infantry escort. In later years Major Lewis often reverted to them as among his most interesting and pleasant recollections of his grandmother.

Upon the Lewis estate, overlooking the valley of the Rappahannock, was a favorite spot which she afterward selected for her burial. Where several picturesque gray rocks were piled she would sometimes stop to rest, and, seated upon a low, flat boulder, would meditate while the young ones amused themselves.

But they better liked to nestle near her side while she chatted cheerfully, teaching them les-

TOMBSTONES OF THE ANCESTORS OF WASHINGTON ON HIS MOTHER'S SIDE IN THE CHURCHYARD OF WHITE CHAPEL, VIRGINIA.

gether with garments and provisions, the fruit of her thrift and economy.

Young grandchildren were growing up around her through all this bitter war, bright boys and one girl. The children often came with their mother in her almost daily visits to her honored parent, and were always made welcome, though at the same time required to behave properly. The distance was not great between the suburban mansion of Mistress Lewis and her mother's house in the town, and these visits were frequently returned.

Sometimes the venerable but still active lady

sons of natural history illustrated by their surroundings and linked with the Bible story of the creation of the world, the deluge, and the changes that came over the earth. The manner of her speaking was so deeply impressive that neither the lessons taught nor the scenes connected with them were ever quite forgotten by the young listeners. As one of them related when himself growing old, "There was a spell over them as they looked into grandmother's uplifted face, with its sweet expression of perfect peace," and they "were very quiet" during the homeward walk. A small picture of this

spot was preserved many years in the family, but lost during the war—in the foreground the group of rocks, with two splendid pine-trees towering above them.

Firm as were the forces of her nature, Mary Washington was almost overcome with terror during a thunder-storm. This fear was the effect of a shock received in youth, when a girl friend sitting at her side had been instantly killed by lightning. As long as she lived she would sit silent and still during a thunder-storm, with closed eyes and clasped hands. On one occasion the daughter, missing her mother, and knowing how she suffered, found her kneeling by the bed with her face buried in its pillows, praying. Upon rising, she said, "I have been striving for years against this weakness, for you know, Betty, my trust is in God; but sometimes my fears are stronger than my faith."

The Bible was her constant study, its precepts the guide of her life, and the influence of its teachings ever shone in her character and conversation. When teaching her children from its pages, any irreverence or mutinous merriment was sternly rebuked. The old Bible

brief visits of cheer and comfort from her younger sons, who were serving in the army at different points. John Augustine commanded a regiment of Virginia troops, was afterward a member of the House of Burgesses, and married Hannah, daughter of Colonel John Bushrod. Samuel won the rank of colonel, and was married five times. Charles, the youngest son, also became a colonel, and married Mildred, daughter of Colonel Francis Thornton of Virginia.

After the treason of Arnold, he, with a horde of British and Tory freebooters, landed upon James River in Virginia, plundering and desolating the country; and when, in the spring of 1781, an armament of British vessels ascended the Potomac River, threatening to devastate that portion of Virginia not remote from Fredericksburg, and near Mount Vernon, Washington became very anxious on his mother's account. Speaking of this to her daughter, the serene matron remarked: "My good son should not be so anxious about me, for he is the one in danger, facing constant peril for our country's cause. I am safe enough; it is my part

OLD WHITE CHAPEL, LANCASTER COUNTY, VIRGINIA, WHERE WASHINGTON AND HIS MOTHER ATTENDED, AND WHERE HER ANCESTORS ARE BURIED.

which she used has descended through Robert Lewis to his daughter, the writer's mother. It is a curious specimen of the illustrations of the day, full of horrors and absurdities. The venerable volume is covered with homespun cloth in a check plaid of now faded blue and buff, the Continental colors; this cover, fashioned by her hands, remains upon the sacred book, much worn and patched to preserve the original fabric.

In the intervals of war she had occasional

to suffer, and to feel, as I do, most anxious and apprehensive over him."

When the tidings of the splendid success at Yorktown were brought direct from the General to his mother, she was moved to an exclamation of fervent thanksgiving: "Thank God! the war is ended, and we shall be blessed with peace, happiness, and independence, for at last our country is free." Shortly after the surrender of Cornwallis, Washington left Yorktown with a brilliant suite of French and Ameri-

HOME OF MRS. FIELDING LEWIS, WHERE WASHINGTON'S MOTHER DIED. NOW CALLED "KENMORE."

can officers, and started upon his journey to Philadelphia, stopping on the way at Fredericksburg to visit his mother. It was nearly seven years since he had last seen her face: he left Mount Vernon in May, 1775, and did not return till the autumn of 1781. Now that the time of meeting drew near, his mother was serene but very quiet, only smiling to herself oftener than usual. Yet it was not the hero crowned that filled her thoughts, but the son who, after years of absence and danger, was coming back to her. On the 11th of November, 1781, the town of Fredericksburg was all aglow with joy and revelry. Washington, "in the midst of his numerous and brilliant suite," wrote Mr. Custis, "sent to apprise her [his mother] of his arrival, and to know when it would be her pleasure to receive him. . . . Alone and on foot, the general-in-chief of the combined armies of France and America," he goes on to say in the grandiloquent style of the day, "the deliverer of his country, the hero of the hour, repaired to pay his humble tribute of duty to her whom he venerated as the author of his being," etc. When the warm embrace of greeting was over, looking into his face with earnest, close observance, her eyes enkindled with maternal love, she said tenderly, "You are growing old, George; care and toil have been making marks in your face since I saw it last." Her voice is said to have been singularly sweet, and he loved its cadence as she called him by name.

She inquired as to his health, and she spoke much "of old times and old friends, but of his glory not one word."¹

The citizens of Fredericksburg had resolved to give a grand ball in honor of the victors, and the lady above all others who should grace the *fête* was the mother of Washington. The messenger who called to invite her attendance was graciously received, and her consent given to gratify her son and friends, although, she added, her "dancing days were pretty well over."

The town-hall at Fredericksburg, where this ball took place, was decorated with evergreens and flowers, and had fresh muslin curtains at the windows, and seats along the side of the room for those not dancing, and a low platform at the end where chairs were placed for the most distinguished guests. When Washington entered at the early hour then considered correct, his mother leaning upon his arm, every head was bowed in reverence. She wore a simple black-silk gown, with snow-white kerchief and cap, her figure still erect, though it had grown thinner and frailer than it once had been.

The foreigners stood in admiring astonishment as they watched the crowd pressing forward to gain a salutation. When she was holding her little court, one of the French

officers observing, "If such are the matrons of America, well may she boast of illustrious sons." Neither elated nor excited by the largess of compliments and attentions bestowed upon her, when ten o'clock approached she rose, and, bidding good-night, remarked that it was "time for old folks to be in bed," and left the ball-room, supported as before upon her son's strong and tender arm.

The Marquis de Lafayette, before leaving

friend, his hero, the preserver of the country and its liberty. For had not America adopted the sons of France who fought for her, and was not Washington's mother dear to him for her noble son's sake? After listening to this outpouring of enthusiastic praise, her simple answer was, "I am not surprised at what George has done, for he was always a good boy."

Lafayette remained some time talking with her, and when he arose to take leave referred

UNFINISHED MONUMENT TO MARY WASHINGTON, FREDERICKSBURG, VIRGINIA.

the States for his home in France, and after a farewell visit to Mount Vernon, came to Fredericksburg to bid adieu to his friend's honored mother,—there is a discrepancy in statements as to the exact date of this visit,—and upon the occasion was conducted to her presence by the young grandson Robert Lewis, who often narrated the incident to his family and friends.

She was walking in the garden, taking careful note of its condition, when they approached. Her black stuff gown and apron were as neat as a nun's, while above the white cap that nearly covered her gray hair a broad straw hat was worn, tied down under her chin.

"There, sir, is my grandmother," said young Lewis, pointing toward her. The Marquis made the military salute as they approached, while she, recognizing the distinguished visitor, came to the garden paling, and, looking over, with a kind smile remarked: "Ah, Marquis, you see an old woman; but come in, I can make you welcome without parade of changing my dress."

The impulsive Frenchman's reply was full of warmth, he calling her the mother of his

to his speedy departure for his native land and home, and asked that she would bestow upon him a blessing. With clasped hands, and the light of faith in her uplooking eyes, the blessing was fervently invoked, beseeching that "God might grant him every blessing of safety, happiness, prosperity, and peace," so moving the heart of her noble guest that tears filled his eyes, and, taking the frail, faded hands into his warm clasp, he bent his head to touch them reverently with his lips as the final adieu was spoken. The grandson who witnessed this scene said that it was "so affecting that he almost choked to keep from crying aloud." Speaking of Washington's mother subsequently, the Marquis made the remark that he had seen the only Roman matron who was living in his day.

The years of life now left to her were weary ones, a painful and wasting disease—cancer—caused by an accidental blow slowly undermining her naturally fine constitution. The weakness and suffering were met with uncomplaining calmness and cheerfulness; nothing that could be done by her loving children for her health and comfort was omitted.

Writing to the President from Fredericksburg, July 24, 1789, his sister says:

I am sorry to inform you mother still suffers from her breast. She is sensible of it, and is perfectly resigned — wishes for nothing more than to keep it easy. She wishes to hear from you, and will not believe you are well till she receives it from under your hand.

When the summer heats of the low country were prostrating, she was sometimes persuaded to take a trip to Berkeley Springs and the fine mountain country of Frederick, where her sons Samuel and Charles resided. Her life was happily spared to see her eldest son elevated to the highest dignity a grateful people could offer. It was in April, 1789, that a final farewell took place between mother and son. He found her bright of mind, serene of spirit, but weak and worn in body. The fear that this would be their last meeting on earth intensified the tenderness of the interview. When the son spoke regretfully of her illness, inquiring anxiously if something more might not be done to relieve it, and expressed his profound sorrow that public duty compelled him to leave her, but however painful, he could not go to his responsible position without having her bid him God-speed, then adding, "So soon as public business which must necessarily be encountered in arranging a new government has been disposed of I shall hasten to Virginia and —" she gently interrupted him. "You will see me no more," she said. "My great age and the disease that is rapidly approaching my vitals warn me that I shall not be long in this world. I trust in God. I am prepared for a better. But go, George, and fulfil the high destiny which Heaven appears to assign you. Go, my son, and may that Heaven and your mother's blessing be always with you."¹

Her hand was laid upon his bended head, and the great man's strong frame trembled in the parting embrace, while a sob, almost a groan, burst from his breast, for already he saw that the shadow of death was upon her.

When Washington rose to go she went with him to the door, leaning fondly upon his arm. Stopping on the threshold to repeat the last adieus, her son silently pressed into her hand a purse filled with gold pieces. This she refused to receive, and insisted upon returning the gift. "I don't need it, my son," she remonstrated. "My wants are few, and I think I have enough."

"Let me be the judge of that, mother," he replied; "but whether you think you need it or not, keep it for my sake."

This appeal was irresistible, and the purse was retained; but after he had gone she dropped it indifferently upon the table, and sank into a

chair, lost in sad reverie. Her grandson, coming with a message, witnessed this parting scene, and, too respectful to disturb her sorrow, hastened home to tell his mother all that had passed. Feeling anxious touching her mother's state, and fearing that this painful excitement might cause serious illness, she hastened at once to her side. Very calm and still they found her, seated with drooping head and sad, unseeing eyes.

In Washington's cash-accounts and memorandum-books many entries appear of money given to his mother, in sums ranging from three to thirty pounds, during a period of years. Also "a chaise" and a "cloth cloak lined with silk shag."

Mary Washington's forebodings were fulfilled, for her death took place a few months afterward (in August), in her eighty-third year, upheld by unflinching faith in the promises of her Bible and by full belief in the communion of the saints. It has been supposed that this event took place at the house in Fredericksburg where she had lived so many years; but there is a tradition that not long before her death the daughter induced her to consent to a removal to the Lewis home. All of her relatives, children, and grandchildren who could come were there; but the best-beloved son was far away.

Extracts from a diary of Robert Lewis, then in New York acting as assistant private secretary to the President, his uncle, inform us that on August 22 he was "surprised by a visit from Parson Ryan, who has brought letters from my sister Carter and Mr. Carter making mention that my grandmother was exceedingly ill and not likely to recover"; and though her death took place on the 25th, and she was laid to rest on the 28th, the news, sent by a messenger who had to ride the distance from Fredericksburg to New York, did not reach her son until September 1. The diary further states that "Baron Steuben and Governor St. Clair dined with us to-day [September 1]; the Baron was remarkably cheerful and facetious, likewise greatly devoted to the President. In the midst of our mirth my uncle received a letter . . . informing him of the death of my grandmother, an event long expected." Only so far does the brief record go, but its writer said afterward, in a letter to his mother, "My uncle immediately retired to his room, and remained there for some time alone."

Those who remembered Mary Washington's appearance in the later years of her life describe her person as being of medium size and well proportioned, the dignity of bearing, the erect carriage, giving something of stateliness to her presence, while her features were regular and strongly marked, her brow fine, and her eyes a clear blue.

No authentic portrait of Mary Washington

¹ Lossing, p. 67.

is known; it is a family tradition that in the destruction of Wakefield by fire the family portraits were lost. Colonel G. W. P. Custis was questioned as to his knowledge of the subject, and replied by letter to Colonel Lewis W. Washington that "there was *no picture* preserved of the mother of the chief," and this has been always the belief of her descendants.

At Fredericksburg on the day of the funeral all business was suspended, and though the August sun shone hot, crowds of citizens from town and the country around "thronged St. George's Church, . . . where the impressive funeral service of the Protestant Episcopal Church of America . . . was conducted by the Rev. Thomas Thornton, her pastor." And then, borne reverently in her coffin by strong men, the mortal remains of Mary Washington were conveyed to the spot she had chosen for her burial, followed by a long procession.

Colonel Custis, Dr. Lossing, and other writers have emphasized the transmitted accounts of her death, telling how "clergymen throughout the land spoke eloquently from their pulpits of the honored dead, while members of Congress and many private citizens wore the usual badge of mourning in respect to her memory." In a long letter to his sister—recently given in Ford's publication—Washington speaks religiously and tenderly of their mother's death and her Christian character.

For many years her grave remained un-

marked. About the year 1830 there was a plan proposed to remove the remains, and to place them in a vault under the Presbyterian church; but to this the Washington family positively refused consent. Many other suggestions and proposals were made, but nothing was done till at last, in 1833, the Hon. Silas E. Burrows of New York offered to raise a monument at his private expense. The corner-stone was laid with imposing ceremonies by the President of the United States, General Andrew Jackson, in the presence of the relatives, many distinguished guests, and a large concourse of people.

Unfortunately, when the monument was almost completed, the generous donor, meeting with sudden and severe reverse of fortune, was unable to finish the work of placing the obelisk upon its handsome base. Hoping to rally from his financial prostration, Mr. Burrows requested the committee to wait awhile until he could have the work finished, but not long afterward he died, before recovering anything of his fortune. Then disagreements arose regarding the matter, and the shaft lay prone upon the ground, slowly disintegrating, for nearly sixty years, until the women of the country rallied to the rescue, as they did for Mount Vernon, and the Mary Washington Monument Association, organized a few years ago and now successfully working, will before long complete their patriotic plan, and perfectly restore the now mutilated monument.

ITALIAN OLD MASTERS.

LORENZO LOTTO.—1480(?)—1554(?).

THERE is absolutely no record known of the birth of Lorenzo Lotto, one of the most important of the second-rate painters of the Venetian school, and remarkable for the range of his emulations rather than for genius or individuality. He may be compared to Andrea in the school of Florence, less individual, but more varied in his appreciation and imitation of the masters about him. He began as a follower of the Bellini, later inclined to the style of Palma, then to that of Giorgione, and finally became Titianesque, but with a tinge of Lombard execution underlying his manner. His family was of Bergamo, and his life was passed mostly under the influence of the Venetian school; but he was a great roamer, and though he painted in some of the cities of central Italy, and finally, when his powers as a painter had declined through age, died in the sanctuary of San Loretto, he was on the whole one of the most faithful followers of Titian whose works are left us. Cavalcaselle says of him: "It is easy to be enthusiastic about Lotto's talent;

he had a very fine feeling for color; he became a master of foreshortening and modeling; he studied action in its most varied forms, and rendered it with unaccustomed daring; expression in every mood—expression roguish, tender, earnest, solemn, he could depict them all. But there was one thing lacking in his pictorial organism—he lacked the pure originality of genius and independent power." To put it in fewer words, he lacked imagination, without which there is no great individuality. A man may contrive a new manner, but a genuine style cannot spring from imitations or determination to be original, but is the expression of the personality, which can be told in art only by the presence of creative power—that is, imagination. Lotto's styles were many, but none of them his own; he was a reflex of whichever painter of genius at the time had absorbed him. He was a painter of enormous fertility, and as a portrait-painter is considered in the aggregate of his production inferior only to Titian, among all the painters of the generation suc-

ceeding his. Some of the pictures which are now conclusively assigned to him are among those long attributed to Giorgione. To that number belongs the example engraved by Mr. Cole for the frontispiece of this number, painted after Lotto had fallen under the influence of the brilliant genius of Castelfranco.

With this general technical mastery of the art of painting, in which few of his time surpassed him, and the want of a strong and individual inspiration in the conception of subject, it might be expected that a man growing up in art under the conditions of life at Venice would become a successful portrait-painter, and this was, in fact, the capacity in which he rendered his best service to the ages following his own. In this vein of art he had few superiors, and none except the half-dozen leading masters just preceding him. There is at Hampton Court a portrait, long attributed to Correggio, but now known to be by Lotto, of a gentleman in a fur pelisse, seated at a table with fragments of antique sculpture near him; he holds a statuette in his right hand, and on the table are a book and some coins. Cavalcaselle considers it the portrait of the contemporary connoisseur Andrea Odoni, and says of it:

There is hardly a masterpiece of this time more deserving of praise than this half-length for warmth and fluid touch, for transparency of color, and freedom of handling. It has the qualities of softness and brilliance combined with excessive [exceeding?] subtlety in modeling, and tenderness of transitions.

And again he says:

There are few masters of the time, if we except Titian, of whom we possess so many and such masterly portraits. That some of these should be attributed to Giorgione, others to Leonardo, and others again to Titian and Pordenone is one of the natural consequences of a versatile manner. In one of the best single figures under Pordenone's name at the Borghese palace, we have the semblance of a stout, florid man in grand attire, whose turn of thought is possibly illustrated by a hand resting on a death's-head concealed by flowers. St. George tilts at a dragon in a landscape seen through a window. We do not meet with a finer or more dignified pose in any of Titian's canvases, nor do we know of any other example in which Lotto so nearly approached Vecelli. The treatment is broad and powerful; the color, in its warm and golden transparency, is fluid, and modeled with perfect blending.

W. J. Stillman.

NOTE BY THE ENGRAVER.

THE "Three Ages of Man" is in the Hall of Saturn of the Pitti Gallery, Florence. It is painted on wood, and measures 26 inches in height by 31¾ inches in width. Though much retouched, it is still a fine example of Venetian coloring. The background is a rich, deep, dark color; the flesh-tints are mellow and glowing. The garment of the old man is of a rich, soft cardinal. The color of the boy's garment is a purplish maroon; his scarf is scarlet, not brilliant, but soft and rich. His cap is black, from beneath which flow his dark locks. The garment of the young man is a soft, delicious green. How vain to describe these

harmonious colors! His hair is brown, imperceptibly softening into the background, after the manner of Giorgione. Indeed, in its breadth and softness of treatment, the whole thing reminds me of Giorgione. How charming it is in sentiment, and in the perfection of its arrangement! I like the way in which the beautiful boy, with his gay scarf, is brought into contrast with the stern, bald old man. The painting of the old man's head is wonderful in its deftness of execution and its subtleness of treatment. The characteristics of age are in every touch, while there is that breadth of handling that bespeaks the consummate master.

T. Cole.

THE "WYOMING" IN THE STRAITS OF SHIMONOSÉKI.

IN the annals of the American navy no achievement of a single commander in a single ship surpasses that of David McDougal in the *Wyoming* at Shimonoséki. Happening on the other side of the globe, during our civil war, this daring exploit passed unnoticed at the time. Ignored by our naval historians, it has thus far found no chronicler. The modest report of the hero, in about five hundred words, conveys no idea of the splendor of the achievement.

Briefly told, the story is this: A sloop of war of six guns, in a narrow strait, engaged during seventy minutes a force of seven batteries mounting thirty heavy guns, and three men-of-war carrying eighteen guns—in all, forty-eight guns. The Japanese force comprised probably twelve hundred men. The *Wyoming*, unassisted, destroyed one of the batteries, sunk two ships, disabled a third, and emerged from the conflict with a loss of four men killed and seven wounded.

The *Wyoming* was a sister ship to the *Kearsarge*, and on the same errand. At the outbreak of the war, being one of the few national vessels within call, she was despatched to the Asiatic station. Built in 1858 by Merrick & Co. of Philadelphia, she was rated as a sloop of war, second class, of 726 tons. Like the *Kearsarge*, she was of the type recommended, as far back as 1841, by Captain Matthew Calbraith Perry. This sailor diplomatist was not only one of the most accomplished artillerymen in the navy, but the trainer, as both officers repeatedly and gratefully acknowledged, of David McDougal and the able executive officer of the *Kearsarge*, James S. Thornton. Long and narrow in build, of great speed, the *Wyoming* was armed with the heaviest ordnance. With only four 32-pounder broadside-guns, she mounted amidships two 11-inch Dahlgren pivot-guns.

In anticipation of Confederate privateers being let loose in the eastern seas, the *Wyoming* received a new crew at Panama, and was put under the command of McDougal in June, 1861. This tried and true officer was then a commander. He was fifty-four years old, had seen service for thirty-two years on many seas, and had been under fire in the Mexican war. Having been trained especially on steamers, he had little of that fear which in 1861 occasionally possessed, like a paralyzing demon, naval

officers who had never fought over a boiler. Though he had served for sixteen years in one grade,—that of lieutenant,—he was not a creature of routine, afraid of taking responsibility when necessary. One of his companions in service had been Lieutenant James Glynn, who, at Nagasaki, in 1849, with his little fourteen-gun brig *Preble*, in the teeth of all the Japanese batteries, had dashed through the cordon of spy-boats and compelled the release and delivery of eight shipwrecked American seamen. With such precedents in Japan as Glynn and Perry, McDougal was the man to make the most of his ship and men. Among these, mostly native Americans inured to danger and burning with patriotism, were some foreigners who required watching, and McDougal found it expedient occasionally to shift or change the personnel of the gun-crews. Even after the battle, with the smell of powder still in their clothes, he found a Portuguese fighting an Englishman because the latter had said, "My stomach is on the *Wyoming*, but my heart is on the *Alabama*."

The complement of the *Wyoming* was 160 officers and men. The efficient executive officer was the late Commander George W. Young, who nobly seconded his captain in every enterprise. Master William Barton, then twenty-three years old, now President of the Maryland National Bank at Cambridge, Maryland, was in charge of the forward division, and Acting Master John C. Mills was in command of the after guns. Surgeon E. R. Denby, Paymaster George Cochran, Engineer (now Captain) Philip Inch, and Ensign Walter Pierce, were among the other officers, all young, and of the finest stock of which our naval officers are made.

By the end of the year 1862 the Americans resident in Japan felt like men without a country. The *Alabama* had so swept American commerce from the seas that the sending home of a package, or even of a letter, became a matter of extreme risk. News of disaster to the Union armies came thick and fast, and Americans were frequently twitted by men speaking their own tongue that the day of the "United" States was over. Besides the national troubles at home, they were living as social exiles in a land threatened with both civil and foreign war, because one party had determined to sweep all foreigners out of Japan.

On the 4th of April, 1863, Captain McDougal, then at Hong Kong, and alert for the *Alabama*, received word from the Minister of the

United States in Japan, the Hon. Robert H. Pruyn, to bring the *Wyoming* to Yokohama, and to "be ready to use her guns for the protection of the Legation and American residents in Japan." Incendiarism and assassination on the part of the Japanese *ronin*, or "wave men," were increasing, and the sight of an American man-of-war would be welcome. Shortly after the *Wyoming's* arrival the American Legation in Tokio was burned to the ground, but whether on account of politics or by accident is not known to this day. By an act of terrorism, but in evident anxiety for the safety of all foreigners, the Tycoon's ministers secured the removal of all Americans from Tokio and Kanagawa to Yokohama. The American flag was hauled down in Tokio, never again to float over the Legation of the United States established where it ought always to be—at the seat of the Government—until John A. Bingham raised it in 1873 in Tokio, then the imperial capital. The *Wyoming* was turned into a temporary hotel, and the American families were accommodated on board until shelter under her guns was to be found on shore. The British, French, American, and other legations ate humble-pie at Yokohama, because a horde of would-be assassins held Tokio in terror.

The Japanese were, in fact, already well advanced in those internal troubles preparatory to the crisis which they had been approaching for a century, but which the presence of foreigners, by disturbing the elaborate political machinery created by Iyéyasû, had precipitated. Potentially, the civil war of 1868, under which the "curtain government" of Tokio, the dual system, feudalism, and Old Japan were to sink into oblivion, had begun, though foreigners knew not the significance of the mighty movement which was to give birth to New Japan. They supposed the turmoil to mean simply the revolt of two great feudatories from their suzerain, and that it was simply a quarrel between Satsuma and Choshu on the one hand, and the Shogun on the other. The British agents were pressing those demands upon the Tokio government for "the Satsuma outrage" in the murder of Mr. Richardson, which issued in the bombardment of Kagoshima, even after \$440,000 of indemnity had been paid.

Tokio at this time had lost its prestige and nearly all the spectacular glory of feudalism, which now centered at Kioto. At this city gathered tens of thousands of two-sworded clansmen over-eager to flesh their blades. They were furious alike at the vacillating Tycoon and at the "ugly foreigners," for whose expulsion from the defiled Land of the Gods they clamored. The "Great Prince" of Tokio had been compelled to come to Kioto, and on his knees and with face on the ground to pay homage to

the divine Mikado, not only "worshipping the dragon countenance," but impoverishing himself by a list of gifts that reads like the catalogue of a museum of decorative art, and which cost 63,000 ounces of silver. The sole purpose of this untold personal trouble, profound humiliation, and heavy mulct was the hope of staying the imperial edict that all foreigners should be expelled from the Holy Country, the ports closed, and Japan resume her hermit-like isolation. In vain, however, did he "moisten the whole populace in the bath of his mercy," for the decree of the Emperor had gone forth. "The ugly barbarians," so ran the edict, "are watching the Empire with greedy eye, and you will, in obedience to his wish, perform the exploit of sweeping them away." In Japanese phrase, signifying what Darius meant by "the laws of the Medes and Persians," "the decree of the Mikado is like perspiration—it never goes back."

This was the edict which set the clansmen of Choshu at work building batteries, and which let loose the ronin, the unattached two-sworded bullies and swashbucklers, all over the country. They swept Tokio as with a broom, until no foreigners, despite all their fleets and soldiery, were left in the city, while Yokohama became an intrenched camp. The work of incendiarism and assassination was carried on diligently, even by youths who afterward became the liberal and enlightened men of New Japan; for their object was to embroil the Tycoon with the treaty powers, and thus to effect his overthrow, that the Mikado might be restored to supreme power.

On the 28th of May, in Kioto, with all decorative circumstance and spectacular pomp, the Mikado Koméi, father of the present Emperor Mutsûhito, borne invisible in his phoenix car, accompanied by the Tycoon, Hitotsûbashi,— "the throne and the camp" together,—made a ceremonial visit to the shrines of the gods to pray for the "brushing away of the ugly barbarians." Myriads of people worshipped the Mikado as his Mysteriousness passed by, and prayed to him as the representative of the heavenly gods. His imperial Majesty took this solemn step preliminary to heading his armies for the sweeping away of the foreigners. June 25 was fixed as the date. Mere children in their seclusion, the courtiers imagined that by the word of the Emperor, backed by the sword and "the unconquerable spirit of everlasting, great Japan," the task would be as easy as the splitting of a bamboo. On the 23d of June, at Yokohama, even while the carts loaded with silver were being emptied of their \$440,000, which was deposited as indemnity in the holds of the British ships *Euryalus*, *Encounter*, and *Pearl*, the order

for the closing of the ports and the notice to all foreigners to leave Japan were duly received. At the same time the Tycoon, a gentleman still living, who knew what foreign ships and cannon were, sickened at his task and wished to resign, but was not allowed to do so. Like grist poured into a hopper to be ground between the upper and the nether millstones, he manfully addressed himself to the hopeless tasks laid on him by the foreign diplomatists and his sovereign.

Meanwhile, Mori, lord of Nagato, or Choshiu, being guardian of the Straits of Shimonoséki, had resolved to begin war on his own account. So soon as the barbarian-expelling edict was promulgated, swift couriers were sent southward. In a few hours after the receipt of the news hundreds of laborers, under native engineers, were leveling, excavating, and throwing up earth on commanding portions of the bluffs overlooking the narrow straits. They worked under a flag inscribed "In obedience to the imperial order." Before the rise of Iyéyasū and the Tokugawa family of Tokio rulers, in 1600, the lord of Choshiu held sway over eleven provinces. When Iyéyasū became master of all Japan, and covered again the chess-board of the Empire, he stripped Mori of all his possessions except two provinces. Proximity to Kioto was coveted by the great daimios, with a view to seizing the imperial person and making a *coup d'état*. This was the king-move in the game of Japanese politics. Iyéyasū checkmated Mori, and surrounded Kioto with his own most loyal vassals. He further pressed the game by setting the Kokura clan between Choshiu and Bungo, so that the powerful feudatories Mori, Kuroda, Nabéshima, and Arima could never easily unite for harm to the Tokio government. This old allocation of friend and enemy on opposite shores of the straits explains why only one side was at this time fortified. After two centuries of galling subjection, Mori now saw a grand opportunity to regain the ancient fortunes of his house by obeying Kioto and defying Tokio. Iyéyasū's maxim of "divide and rule" seemed about to be turned against his heirs.

The Straits of Shimonoséki form the western entrance into the Inland Sea, and divide the great islands Hondo and Kiushiu. They are three miles long and from one half to one mile wide, the navigable channel being from three to seven hundred feet wide. The town, of eighteen thousand inhabitants, consists chiefly of one very long street at the foot of bold bluffs, except that in the center the houses completely encircle and cover two or three small hills, and cluster thickly in a ravine. The town of Shimonoséki, like that of Nagato, or Choshiu, is ancient, mirroring in its name

the old feudalism of Japan. It means "the lower barrier," at which all persons passing or entering Nagato, or the long gateway of Hondo, the main island, must be examined. Some have called it "the Gibraltar of the Japanese Mediterranean."

As geography is half of war, so the most famous naval battles in Japanese history took place here in the twelfth and the nineteenth centuries. The tide in its ebb and flow runs like a mill-race at the rate of five miles an hour, and the violent oscillations acting upon the numerous sunken rocks and shoals have, in the course of centuries, furnished an appalling list of wrecks and a great loss of life. Every landmark in the region is eloquent or ominous with traditions of gloom. It is told that the foundations for a beacon, often swept away by the invincible current, were finally made by binding a fair virgin to the granite block, as it was lowered into the waters. Her life propitiated the dragon whose lair was beneath, and the tower was built. On one of the rocky ledges stands the monument of the young Emperor Antoku, drowned in the great naval battle, A. D. 1185, between the Genji and the Héiké, the white and red flags, when possibly one thousand war-ships fought together. The same waters which were reddened with the blood of the nearly annihilated Héiké clan were to witness, seven centuries later, a series of artillery conflicts between ships and forts—the prelude in both cases of a new era of national development.

At advantageous points on the bold bluffs overlooking the rushing current of this narrow and crooked passage the Choshiu men prepared the ground for seven *ho-dai*, or cannon-platforms. These were from 50 to 100 feet above tide-water, and each mounted from two to seven guns. A few of these were 12- and 24-pounders, but most of them were 32-pounders, and several in the batteries nearest to the town were 8-inch Dahlgren cannon, which the United States had presented to the Tokio government, but of which the Choshiu men had in some way obtained possession. For several years previous the study of Dutch treatises on fortification had been carried on, and it is even possible that thus early there had been direct instruction by French artillerymen.

The Choshiu clansmen trusted not only to their batteries to close the straits and thus to bring on war, but also to their armed ships. Ostensibly for the Tokio government, they purchased of the American firm Jardine, Matheson & Co., for \$160,000, the iron steamer *Lancefield*, of 600 tons. They also secured for \$45,000 the clipper-built brig *Lanrick*, a fine sailing vessel formerly used in the opium trade, and for \$22,000 the American bark *Daniel Webster*. On the steamer they mounted four, on the brig

ten, and on the bark six guns, mostly brass 24-pounders. On these vessels they raised the flag of Japan, a red ball or sun on a white ground, and at the fore the blazon of Choshu, a blue flag with a straight bar at the top, and, underneath, a pyramid of three white balls. They named the war-steamer *Koshin* and the brig the *Kosei*. Without knowing the Chinese characters, we read the names as meaning "loyalty to the Mikado" and "in the Emperor's service," or "imperial vassal" and "imperial order," respectively.

Ships and batteries were not fully completed, but nevertheless were ready for action, when, on the 25th of June, 1863, the very date appointed by imperial order for hostilities, the first game appeared in sight, of which these eager hunters expected to make easy quarry.

The American merchant steamer *Pembroke*, from Yokohama to Nagasaki and Shanghai, entered the straits in the afternoon, passing on her way an armed Japanese bark. Instead of attempting passage through the seething, current-tossed waters, her captain obeyed the customary sailing directions, and awaited slack water. She carried the United States flag, and her Japanese pilot had been furnished by the Tokio government. Shortly after her anchor was dropped the armed bark moved past her and anchored a short distance off. It was noticed that she carried the national flag of Japan, although it was the law that vessels owned by daimios should fly the clan or feudal flag at the fore. There was no suspicion of hostilities, however, harbored by the captain of the *Pembroke*. An hour after midnight the bark suddenly opened fire on the American ship. Some minutes later a brig, which was made out to be the *Lanrick*, appeared in view, her crew shouting as they passed the *Pembroke*, and, anchoring near the bark, began firing on the American ship. As it was reported in Tokio a few days afterward, and officially made known to Mr. Pruyn by an officer of the Foreign Office, that the American vessel had been sunk, it is probable that the doughty cannoners, who had broken the peace of two hundred and fifty years by firing the first hostile gun, did really so believe. As a matter of fact, it being a dark night, the *Pembroke*, having steam up, eluded her assailants by retracing her course, and, escaping through the rarely used Bungo Channel, reached Shanghai without having touched at Nagasaki. For indemnities, "loss of time, freight, passengers, and deadly peril," etc., though no one was hurt, and no paint, rigging, or wood injured, the owners at once sent in a bill for \$10,000, through the American Legation, to the government of Tokio. As a matter of fact, \$12,000 were paid.

By the 8th of July the batteries were finished,

the ships equipped, and the gunners, after practising night and day, well trained. The Dutch treatises on artillery had been well conned, and were curled into dog's ears at the pages treating of how to attack ships caught in a current. A French despatch-vessel, the *Kien-chang*, on her way from Yokohama, appeared in the straits July 8, and anchored as usual to await the turn of the tide. The batteries at once opened upon her, and she was hit in seven places. A boat was lowered to inquire into the reason for these surprising hostilities, but a well-directed shot shivered it to pieces, killing several men. With heavy work at the pumps, the *Kien-chang* was able to reach Nagasaki, though nearly in a sinking condition. Her commander informed Captain, now Admiral, de Cassembroot of the heavy Dutch frigate *Medusa*, sixteen guns, then on her way to Yokohama, of what had happened.

For 250 years the flag of the Netherlands had been known in Japan. The Dutch commander, though hoping for peace, went well prepared for war. Anchoring at night, the frigate entered the western entrance at daylight on the 11th of July. As the current was running at five knots, and the *Medusa* was able to steam only six knots, progress was slow, though in this case desirably so. Signal-guns, two from the first battery and eight from the brig, were heard, yet, as the opposite shore was lined with Japanese junks, the Dutch captain was disposed to think that no hostile shot would be fired. Vain hope! No sooner was the *Medusa* opposite the brig, than the *Lanrick*, which flew the flag of Nagato, the bark *Daniel Webster*, and the heavy battery of Sennenji, mounting six guns, opened simultaneously. In a few minutes the frigate was within the concentrated fire of six batteries. What most astonished the Hollanders were the projectiles, such size and weight being undreamed of. The splendid abilities of the Japanese artillerists and the rapidity of their fire were astonishing. To find 6- and 8-inch shells exploding on their ship was a novelty to the Dutchmen in the eastern world, and showed that the Japanese were up to the times. With his port broadside Captain de Cassembroot illustrated true "Dutch courage" for an hour and a half. Unable, on account of his draft, to attack the ships directly, he passed on his way. The *Medusa* was hit thirty-one times. Seven shots pierced the hull, sending bolts and splinters in showers about the decks. Three 8-inch shells burst on board. The long-boat, cutter, and smoke-stack were ruined. Four men were killed and five wounded. On his return to Europe Captain de Cassembroot was knighted, and his crew received medals of honor. He is still living at The Hague.

A few days later, July 20, the French gun-

boat *Tancredi* was hit in three places while swiftly steaming through the channel. Later, a Satsuma steamer, mistaken for a foreign warship, was set on fire and sunk by the batteries. The bodies of nine officers and nineteen men, killed or drowned, were swept out to sea. Evidently, then, the Japanese as artillerists were not to be despised.

Before any news of hostilities was received at Yokohama the *Wyoming* had received orders to return to Philadelphia by way of the Straits of Sunda. Officers and men were in high spirits at the prospect of home and the possible capture of the *Alabama* on the way thither. When, however, on the 11th of July, the Tokio government gave information of the attack on, and the supposed sinking of, the *Pembroke*, the exact facts being received by mail from Shanghai next evening, Captain McDougal, rejoicing that the daimio of Nagato had provided an *Alabama* at hand, ordered coal and stores on board with all despatch. Two Japanese pilots were furnished by the Tokio government. Mr. Pruyn sent his interpreter, Joseph Héko, a native gentleman picked up at sea as a castaway, educated at Baltimore, and still living. Journalism was represented by Mr. E. S. Benson, an American who edited a cable paper at Yokohama. Without charts of the straits, or map of the batteries, Captain McDougal took care to learn the exact draft of the *Lancefield*, finding to his delight that where she went the *Wyoming* could follow. He hoped to board and capture her, and perhaps one of the other vessels. Weighing anchor at 5:30 A. M. on the 13th, and entering by the rarely used Bungo Channel, the *Wyoming* anchored at the eastern end of the straits at 9:30 P. M. on the 15th. There McDougal awaited the favorable turn of the tide.

Moving into the straits at 5 A. M. next day, the point of Shiroyama was rounded at six o'clock. Signal-guns were fired, and were repeated along the six batteries to the town, which was still invisible, owing to the promontory of Monshi, which projected from the southern shores of Bungo, where no batteries were. In a few minutes the first shot struck the ship just above the engine-room, cutting away the wind-sail halyard. The crew were beat to quarters, but no reply was made until after rounding the Monshi promontory on the southern side, when the whole panorama of the town, the larger batteries, and the three Japanese men-of-war burst into view. The bark was lying close in toward the town or northern shore; fifty yards outside of her and one length ahead was the brig; another length ahead and outside of the brig was the steamer. The main channel lay south and outside of all these vessels. McDougal noticed that stakes had been driven into

the mud along the edges of the main channel, and it was evident that the Choshu cannonceers expected to blow the *Wyoming* to atoms. As the three vessels lay with their sterns to the *Wyoming*, each in turn was quickly recognized. All three were crowded with men, and from the steamer hung kedge-anchors at the yard-arms, to be used as grappelling-irons for boarding. On each vessel the national flag of Dai Nippon was flying at the peak, and the feudal flag at the fore.

In symbolic design the Choshu pennant would have been suggestive to the occidental mind of the pawnbroker's three balls and the ominous interpretation of "Two to one you'll never get it again"; but the reversed form of a pyramid, one ball above two, gave an omen that was cheering. It meant at least one chance.

What was to be done? The Japanese pilots had at first kept the *Wyoming* in the main channel, bearing to the port side or southern shore. Already frightened when told by McDougal to take the ship toward the northern shore under the very noses of the cannon, they were paralyzed with fear when he ordered them to run the *Wyoming* in between the steamer and the brig. In vain they protested that the *Wyoming* would get aground. Knowing the exact draft of the *Lancefield*, McDougal, though without charts, took all other risks, and steamed directly for the vessels. Immediately another battery of three guns, fifty feet up on the side of the hill, fired its heavy shot, cutting the rigging between the mainmast and the mizzenmast, which showed that remaining in mid-channel would have made the *Wyoming* an easy target. The American flag was now run up at the peak, and all hands were ordered to prepare for boarding. The flag was at once saluted by shot and shell from a fresh battery of four guns, and it was then noticed that the *Lancefield* had steam up and was making ready to move.

Upon this, McDougal called his men back to the guns and gave the order to begin firing. Both pivots and the starboard guns at once opened. So excellent was the gunnery, though at the time the Americans knew it not, that one fort was practically torn to pieces with the shells of the first broadside. As the Japanese historian writes, "One of the balls of the barbarian vessel destroyed a fort, and, encouraged by this lucky shot, she dashed in." As the *Wyoming* forged abreast of the bark the latter opened a broadside fire from three guns, by which two men, William Clark of New Jersey and George Watson of Vermont, stationed near the anchor, were killed, the latter by a chain-shot. A marine in the gangway was also struck dead by a ball from the battery of Sennenji, which, mounting six or seven guns, was the most formidable of all. Within two minutes more the

SHIMONOSÉKI IN 1859.

Wyoming was abreast of the brig, from which a broadside fire of four brass 25-pounders opened. On the port side the steamer was less active, having her guns pointed up the channel and being able to fire only swivels and muskets.

In these few moments every gun on the American ship was worked to its fullest power. She was so close to the bark and the brig that the faces of the Japanese were plainly discernible, the guns seemed almost to touch, and the *Wyoming* to be wrapped in sheets of flame. The Japanese sailors worked their guns so rapidly that no fewer than three broadsides were fired from the brig during the swift passage of McDougal's ship. One of her shells entered under the forward broadside-gun of the *Wyoming*, and killed and wounded all the gun-crew except three. The captain of this gun, William Thompson, having his left arm torn off, and the tackle being shot away, Charles J. Murphy, though himself wounded, lashed the breeching of the gun, kept it in position, and fought this 32-pounder short-handed until, later in the action, Lieutenant Barton sent him reinforcements from the pivot-gun. With the exception of the marine and the two men killed at the anchors, every other man killed or wounded in the action belonged to the division of Lieutenant Barton, whose sword-guard was struck and bent by a piece of shell. In passing the ships, every shot of the American told upon the Japanese vessel on each side.

When out into clear water, the *Wyoming*, having rounded the bow of the steamer, was nearer the southern shore, and the six batteries and the bark concentrated their fire on her. Despite the holes torn in the sides of the vessels by the Dahlgren shells, their guns were still vigorously plied, when the danger hitherto feared was realized—the *Wyoming* was aground. Meanwhile the steamer had slipped her cable and was moving over to the northern shore, whether to escape, to examine damages, or, as is probable, to swing

round and to attempt to ram or board the *Wyoming* while stuck fast, is not known. Fortunately the propeller was powerful, and the *Wyoming* was worked off the mud. Neglecting the bark and the batteries, the brig being already in a sinking condition, attention was turned entirely upon the *Lancefield*.

Manœuvering into favorable position, despite the current, which was running like a mill-race, and training his pair of pivot-guns upon the steamer, McDougal prepared to give the Japanese a lesson in the power of 11-inch Dahlgren ordnance. This was exactly what the Choshiu men needed to know. Of the after-pivot Frank Wyatt, boatswain's mate, was captain. Of the forward gun Peter King, a fine specimen of the American sailor, had charge. Both sent their shot into the hull of the *Lancefield*, whereupon a group of men, presumably officers, left the ship in a sculling-boat, and scores of men jumped into the water, which was dotted with heads as a winter rice-field is tufted with stubble. The second shell of the forward pivot was planted directly in the center of "the Prince of Choshiu's own steamer, the *Koshin Maru*," one foot above the water-line. It pierced ship and boiler, came out on the other side, tearing a great hole, and, passing into the town a quarter of a mile away, exploded among the houses. In a moment great volumes of smoke and steam rolled out of the doomed ship both fore and aft; cinders and wreckage were hurled upward as from a geyser; and as red tongues of flame shot out here and there black crowds of men leaped into the water to swim ashore. According to reports in Tokio a few days later, forty men lost their lives on the steamer. Two more shells were fired to secure the utter destruction of the vessel. When, however, McDougal found that the sailors were using their revolvers upon the Japanese struggling in the water, he called them off, and the inhuman work stopped.

The guns of the bark were still at work as fast as they could be loaded and fired, and despite the smoke concealing the hull of the *Wyoming* the flags on the trucks enabled the

THE "WYOMING."

FROM A PHOTOGRAPH.

batteries to find their target. Upon these and the bark the pivot- and the broadside-guns were now trained. By the splendid gunnery of our sailors several shells were dropped exactly within the batteries, and the bark was so riddled as to be worthless. Three days later the *Tancrède* saw only the tops of the submerged brig, the steamer also having sunk. The fire from the batteries was less active on the *Wyoming's* return, and not a man on her decks was hurt. For their non-participation in the fight the spectators on the southern side, the clansmen of Kokura, were afterward roundly berated by the Choshu warriors, and the Emperor was greatly distressed about their conduct.

the United States the sum of \$10,169. The fact that McDougal had run his ship out of the main channel and close to the northern shore, and then, incredible as it seemed to the Japanese gunners, between the ships without grounding, gave the batteries a good target only in the spars and rigging. Losing their first good opportunity to sink the ship, they failed to regain it. It was thought at first that the cannon of the Choshu men were fixed to fire up the channel only. Before the engagement was over, the Americans found that the Japanese were able to alter their range, and did so. Four days later, when the French admiral appeared with his heavy 35-gun frigate *Se-*

THE SINKING OF THE JAPANESE SHIPS.

Throughout the action both the men and the officers of the *Wyoming* behaved with admirable coolness and *élan*. After a lucky shot the whole crew gave three cheers, enjoying this, their first battle, with fierce delight. After the last battery was passed, and the point of Shiroyama rounded, there was time to count the odds, and hear what surgeon, carpenter, mate, and quartermaster had to report. The battle had lasted one hour and ten minutes, and the *Wyoming* had fired fifty-five rounds, or, from the hoisting of the flag to the last discharge, nearly a gun per minute. The ship was in good fighting trim, though struck in over twenty places. Her hull had received ten shots; her funnel had six large holes in it; and the foremast and the mainmast were injured each in four places, while the upper rigging was badly cut. For rope, wood, canvas, and metal injured, and for ammunition expended, the battle cost the Government of

miramis, the gunboat *Tancrède*, a land force of 250 men, and, provided with maps made by the captain of the *Medusa*, took, after bombardment, a 5-gun battery of 24-pounders, it was found that the carriages were of excellent foreign pattern, able to sweep a wide arc.

Of our gallant sailors four had been killed outright, and two died of their wounds. Two sailors were severely and two slightly wounded. Except a negro, born in Martinique, and three Irishmen, all of these were native Americans. That the Japanese fired a variety of missiles was shown in the abundance of marks left by the grape and canister, the death and wounds by shell, and the killing of a landsman, George Watson, by a chain-shot. James Caswell, another landsman, by a solid shot coming through the bulwarks, was filled with splinters from head to foot, and died at sea on the Sunday following the fight. Michael

Lynch, a coal-heaver, who had both legs shot off below the knees by a ball, walked half the length of the deck on the stumps. Before he died he complained of his toes hurting him.

Sewed in their hammocks, the dead were committed to the deep next morning at 9 A. M. The service was read by the commander, who now, with the tenderness of a bereaved father, and with tears rolling down his face, mourned for his brave seamen. Beloved of his men, he had by kindness won the highest discipline and strongest personal regard even from those whose lifelong habits as landsmen had made the routine of a man-of-war odious, so that the *Wyoming* in all the potencies, human and material, was ever a unit of the highest possible efficiency for the Government of the United States.

The act of the Choshu men, who thus deliberately and voluntarily broke the peace of two centuries and a half by firing on the steamer *Pembroke*, was, as the native historian wrote, "the first deed of arms in Japan." It marked the beginning of civil and foreign war, and began the long political struggle of which the constitutional and representative Japan of the year 1892 is the outcome, and which none more than the Choshu men, both in war and in peace, helped to achieve. Above all things eager to try their strength with foreigners, and to show the "ugly barbarians" the spirit of unconquerable Japan, it was they who began their exhibition upon an American ship. It was an American ship, also, which first gave them a counter-exhibition, not only of extraordinary physical prowess, but of moral courage. To the Choshu clansmen, brave and capable as they themselves were, it seemed as though McDougal possessed more than human nerve in thus running his vessel into the fierce fire which they had prepared for him. Long afterward they spoke respectfully of the "American devils." They had fought the Dutch frigate, and four days later were chastised at one point by the French, but neither of these combats, carried on in mid-channel at long range, or by a charge after the single battery had been emptied by long bombardment, so impressed the thinking men of Japan's most intellectual clan as that of the commander of a single ship coolly and of choice meeting such overwhelming odds at close quarters and winning so surprising a victory. The Choshu men were noted for their thinking, and for the power of profiting by their reverses, and this time their profit was great.

Yet this act of McDougal was not a mere "running amuck," a rash plunge; it was as cool and scientific a movement, albeit one requiring as much nerve and courage, as Cushing's attack

on the *Albatross*. With Japanese prison-cages and torture all foreigners in Japan of that day were acquainted by daily report. Even casual walks around Yokohama had made the American officers familiar with the pillories near the blood-pits, which were almost daily decorated with human heads. Besides, it had been immemorial law and custom for the beaten party in Japan to perform *hara-kiri*; or, failing, to suffer decapitation. It was a clear knowledge of these facts that led McDougal, while shrinking from nothing within the bounds of possibility, to give an order not mentioned in his amazingly modest official report. He had, only a few days before, seen the American flag hauled down and the Legation of the United States driven from the capital; and this was humiliation enough for McDougal. Hence he determined neither to see nor to have the like thing done on the ship he commanded. If boarded or overwhelmed, or made helpless by grounding or a shot in the boilers, it was his deliberate purpose to blow up the ship and all on board, the officer of the powder division being instructed to that effect. Knowing his ship, officers, and men, the draft and the tide, he took the chances, and won. His splendid courage in fighting all their ships and batteries with his one small vessel affected the thoughtful men of Choshu as mightily as when, a year later, as their twelve batteries, mounting sixty-two guns, crumbled under the fire of the combined squadrons of four nations, they swore by all the gods of everlasting, great Japan to give body and soul no rest till they had won the secret of the strength of the western nations. "The plucky falcon had its leg broken," but even while temporarily disabled it dreamed of new quarry. Even before their great battles with the fleet in 1864 Choshu had no need to prove her courage. All foreigners believed and respected it. They saw one clan, and one only, even though well-drilled and armed with American rifles, fighting at one time the whole army of the Tycoon at Kioto and the combined foreign fleet at Shimonoséki. Although unable to sound the depth of Japanese politics, they admired bravery. What puzzled the men of Christendom was the ronin's attack from behind, which they counted as cowardly murder. Both assassination and incendiarism seemed to them barbarous, and as inconsistent with the boasted honor of the samurai as do "the Shimonoséki indemnity" and "Christianity" to the Japanese, when these words accidentally occur together. Yet hard fighters as they proved themselves, the chief glory and distinct mental endowment of the Choshu clansmen is their remarkable capacity, not for military, but for civil, organization and affairs. In military talent and in the bolder virtues the Satsuma men

excel; in patience, foresight, and constructive ability, the Choshu. The two, as mortise and tenon, make superb framework of government.

After their chastisement at Shimonoséki and Kagoshima, both Choshu and Satsuma forgot

ENGRAVED BY T. JOHNSON, FROM A PHOTOGRAPH.
REAR-ADMIRAL DAVID STOCKTON McDOUGAL, U. S. N.

their hatred of foreigners in their eagerness to win the secret of their power, which they suspected lay behind ships and cannon. Thirst for alien blood was consumed in the more intense thirst for knowledge. They overthrew anarchy and feudalism, and made New Japan.

For twenty-two years they have led the most progressive of Asiatic nations. Now, indeed, in limited monarchy and parliamentary government, they are to be forgotten as clansmen, and to be known only in the general democracy of voters. In the education of that clan which, since the era begun by Perry, has produced more than any other the leadership and practical intellect for Japan, McDougal had a larger share than he ever dreamed. Out of that superb company of men came not only Yoshida Torajiro, the man who, with clothing stuffed with paper and pencils to take notes in a foreign country, and with scholarly hands blistered by rowing past the guard-boats, stood on Commodore Perry's ship at midnight beseeching passage to America, but the more brilliant statesmen and leaders, Yamada the brave, Kido the matchless, Inouyé and Ito and Yamagata, statesmen of highest rank, all names forever to be associated gloriously with New Japan.

One of the bravest and best of American naval officers, David McDougal acted not only in harmony with his instincts as a patriot, but in accordance with the tenor of orders from the Navy Department, the urgent request of the American Minister, and the unanimous sentiment of the Americans in Japan. His reward from the Government during his lifetime was ordinary routine promotion, as captain at the age of fifty-five, and as rear-admiral on the retired list at the age of sixty-four. He died at San Francisco, August 7, 1882.

William Elliot Griffis.

THE KING.

SUGGESTED BY GÉRÔME'S PICTURE, "THIRST."¹

STRETCHES of sand whereon no thing of life
Is visible. Above, a copper plane,
Hung like a cymbal poised before the strife
Of clashing. Lying, seething, grain on grain,
The sand stares up, the vacant sky stares down,—
As on two idiots, one by the other seen,
Grows no expression, neither smile nor frown,—
And heated, filmy mists are spun between.
Across this horrid space a lion's tread
Is traceable. None save a king dare track
This hellish vast. Kingly he reared his head,
And his proud step pressed firm upon the rack
Of blistering sand. . . . Far in an oasis
This king bent low a water-drop to kiss.

Louise Morgan Sill.

THE TOTAL SOLAR ECLIPSES OF 1889.

CONTRIBUTIONS FROM THE LICK OBSERVATORY.

EVERY year there must be two eclipses of the sun, and there may be five. These are partial eclipses, however, except in the comparatively rare case in which the moon passes nearly centrally over the sun's disk and produces a total obscuration of his light. Since the invention of the spectroscope, in 1860, there has been barely a score of total eclipses, and a number of these could not be observed because the belt of totality fell at the earth's polar regions or upon the oceans. The belt of totality is a narrow strip—never more than one hundred and seventy miles wide—where the point of the moon's shadow falls upon the earth. Total eclipses

flames which are seen at the sun's border during an eclipse are solar and not lunar appendages. They are shown *dark* in figures 3 and 4. The moon covered them up progressively as she advanced in her orbit. In 1868 Messrs. Janssen and Lockyer established the fact that these rose-colored prominences were, in truth, huge flames and spires of hydrogen gas extending thousands of miles above the solar globe, but truly belonging to it, as our atmosphere belongs to the earth. A method was then invented by which the flames can be observed with the spectroscope on any clear day, even without the intervention of an eclipse, and there are several observatories the chief work of which is the accurate mapping of the solar prominences day by day. Thus the few moments of totality are now left free for other

FIG. 1. THEORY OF A TOTAL ECLIPSE OF THE SUN.

The moon is at A. The eclipse is total to a spectator within the black interior shadow, and partial to a spectator anywhere within the penumbra.

rarely recur, therefore, at the same point of the earth. At London, for example, there has been no total eclipse since the year 1140 except that of 1715, and there will be none during the next century.

Figure 1 gives an idea of the cause of a total eclipse, but the dimensions of the moon's shadow are enormously exaggerated. As the moon moves rapidly along its orbit, the duration of an eclipse to any one spectator is never more than eight minutes, and ordinarily it is not so much as four.

Less than three quarters of an hour of actual observing time has been available to astronomers since the spectroscope was invented, or since photography was first fruitfully used in recording the features of a total eclipse. We are apt to be impatient with the slow progress of science, but, when we consider what advances have been made in these few years, we must admit that each one of the brief and precious moments has been well utilized.

The eclipses of 1842, 1851, and especially that of 1860, proved that the rose-colored

observations, and the discovery of Janssen and Lockyer has virtually doubled our opportunities for the study of the corona itself, which has never been seen except at totality. Dr. Huggins has spent the last few years in experiments in photography, with the object of studying the corona in full sunshine, but so far without success. It is the next great step required.

In 1869 a very favorable total solar eclipse occurred in the United States (the first since 1834), and its opportunities were fully utilized to the permanent fame of American astronomers. The observations of Professor Young of Princeton, and of Professor Harkness of Washington, decided the question as to the general nature of the corona. It certainly consisted of a glowing gas, the composition of which, however, is still unknown. It was a solar appendage, and was not an appearance produced by the earth's atmosphere. The eclipse of 1870 (in Spain) confirmed the results of 1869. In 1871 another eclipse allowed Janssen to observe beside the bright line (1474) in the spectrum of the corona, the presence of which proved

ENGRAVED BY FELIX LE BLANC,

FIG. 2. THE CORONA OF JULY, 1878.

FROM A DRAWING BY M. TROUVELOT.

It is to be remarked that the corona consists of polar rays and of two faint wings.

it to consist partly of incandescent gas, the dark Fraunhofer lines, which showed that some, at least, of its light must be due to sunlight reflected from solid particles near the solar body. Polariscopic observations confirm this also.

The photographs of the 1871 eclipse yielded a marvelous account of the complex details of the inner coronal forms. We began to see, with this eclipse, that the corona was of much more complex nature than the hydrogen flames, for example. Not only was its light derived both from reflected sunshine and from native brilliancy, but it appeared that the inner and brighter corona might even be of a different quality from the long wisps and streamers which form its outer portions. The eclipses of 1874 and 1875, owing to bad weather, etc., added little to previously known facts.

The American eclipse of 1878 was fully observed from Wyoming to Texas. Among its most important results was the observation that the characteristic spectrum line of the corona (1474) certainly extended nearly a radius of the sun (400,000 miles) from the edge, and that when this line vanished no other spectrum was visible. From this the conclusion was drawn that the gas corresponding to the 1474 line (coronium) extended at least to this height above the sun. The observations of Langley and Newcomb showed that coronal matter of some sort extended much further than this, even

out to nine millions of miles. The photographs taken by the parties of the United States Naval Observatory were very satisfactory, and showed the shape and structure of the corona of 1878 to be essentially different from that of 1871. The year of 1878 was a year of few sun-spots; 1871 was a year of many sun-spots. It was suggested that the corona varies periodically in shape and in appearance as the sun varies in frequency of sun-spots, and an examination of the few trustworthy records lent considerable force to the suggestion.

The observations and drawings of the corona which we possess were collected into a splendid volume by Mr. Ranyard of London. A careful examination of the drawings seemed to show that among the thousand apparently accidental and capricious coronal forms two types, characteristic forms, could be traced.

During a period of maximum sun-spot frequency the corona appeared to be fully developed and of great brilliancy. Its typical form was that of a bright quadrilateral filled with rays, which have been likened to those on the card of a mariner's compass.

At a period of minimum sun-spots (as in 1878) the corona, on the other hand, seemed to be far fainter and of smaller dimensions, except for faint wing-like projections which extend sometimes for prodigious distances on each side of the sun. A rough idea of the scale of

ENGRAVED BY K. C. COLLINS,

FIG. 3. THE CORONA OF MAY, 1882.

FROM DRAWINGS BY PROFESSOR TACCHINI.

the various drawings in this paper may be had by recollecting that the diameter of the sun is about 850,000 miles.

A striking event of the eclipse of 1882 was the revelation, during the darkness of totality, of a noble comet near the sun (see figure 3). This eclipse, which lasted only seventy seconds, is also memorable for the new and bright spectral lines which were added to the 1474 line, and which indicated that the corona was composed not only of coronium gas, but of other gases as well. The dark lines due to reflected sunshine were once more visible. The spectroscopic observations of 1883 and 1886 made by Professor Tacchini seem to show the existence not only of the rosy prominences long known, but also that certain other *white* prominences exist, which are due probably to relatively cool products. Moreover, a comparison of the red prominences observed during totality with the same objects seen before and after the eclipse indicates that the ordinary spectroscopic methods give only a part, and not the whole, of the phenomenon. The reason of this is not yet fully understood, and these observations should be repeated at the next eclipse. While we are far from understanding the phenomena of the sun's envelope as revealed by the spectroscope, the foundations for a proper interpretation are laid, and the appropriate methods are already invented. But the corona still remained the mystery of mysteries. Why did it exist at all? Why did it change in

shape and character? How could the same object appear so different at different times? Was it in fact the same object? It was even suggested that the corona had no objective existence at all, but was a pure diffraction phenomenon, like the alternate light and dark interference bands which one can see by holding the edge of a razor up against the bright daylight.

THE ECLIPSES OF 1889.

THE eclipse of New Year's day of 1889 was to be total in California, and the Lick Observatory, then newly established, made preparations to observe it. It was also well observed by other parties, whose reports are not published at the time of writing this account. It was decided to attempt both spectroscopic and photographic observations. The former were directed to the question just spoken of; namely, Is or is not the solar corona mainly a diffraction phenomenon? The observations of Mr. Keeler show that it really has an objective existence, and that the diffraction phenomenon previously observed must have been mainly due to atmospheric glare. Some of the photographs obtained, notably those of Mr. Woods, show the moon projected upon the corona *before the eclipse began*, and therefore before a diffraction effect was possible. The spectroscopic observations made by Mr. Keeler also establish the important fact that the length of a coronal line in the spectrum is no index of the

FIG. 4. THE CORONA OF JANUARY, 1889.

depth of the corresponding gas in the solar atmosphere. This relieves us of amazing theoretical difficulties. We may now consider the sun to be surrounded by a comparatively shallow atmosphere, and have no longer to tax our ingenuity to explain how it is that a comet passing close to the sun is not in the least retarded by a solar atmosphere. Another main object of the expedition was to obtain the best possible photographs of the corona, and for this purpose Mr. Barnard of the observatory utilized our very incomplete photographic apparatus, and supplemented it by turning one of our small visual telescopes into a camera. We were also extremely fortunate in securing the fullest coöperation of the Amateur Photographic Association of San Francisco, which organized a party of seventeen observers, working according to a program which had been prepared in consultation with the astronomers at Mount Hamilton. The vital point of the program was the selection of the proper times of exposure, and here we had the benefit of the advice of Mr. Burnham of the observatory, who showed by experiments in photographing light, fleecy clouds, while the sun was obscured by heavier and darker ones, that the proper exposure times must be very short. It all seems extremely simple now, but this principle had not been well understood at previous eclipses. At the eclipse of 1883 some of the negatives were exposed for more than five minutes! The main object is to register the extremely small contrast between the outlying faint corona and the sky, which is by no means totally dark. This can be done by giving relatively short exposures, and only in this way.

The coöperation of the amateur photographers enabled us to make a series of exposures of varying length, and to test the question in an experimental way. Thanks to their aid and skill, we secured a great number of negatives, and these, together with the exquisite plates made by Mr. Barnard, give an account of the eclipse of January, 1889, which is complete and highly satisfactory. Figure 4 is a copy of one

of Mr. Barnard's negatives. It is on a small scale, because his photographic apparatus was not powerful; but the work was so well done that the original shows a vast amount of detail—more, I think, than has been shown at any other eclipse.

Fig. 6 gives a diagram on an enlarged scale made from Mr. Barnard's photographs by studying them under the microscope. There are very many features shown in these photographs, but I will stop to mention only two of the more important. At previous eclipses the polar rays had been photographed, but it had never been noticed that these polar rays extended all round the solar disk (see fig. 6, rays 2, 4, 6 . . . 18, 21, 24, 26, 30, 32 . . . 37, 50, 64 . . . 71, 75 . . . 84, 86, 98, 100, etc.). They had always been evident at the poles, but at the sun's equator they had been lost in the brightness of the great "wings." It had therefore been too hastily supposed that the polar rays were in fact confined to the region of the poles. The photographs of the January eclipse proved clearly that such rays extended all around the sun. Again, the photographs showed that the corona, instead of growing narrower as we go further from the sun

FIG. 5. EXTENSION OF THE CORONA OF JANUARY, 1889. THE OUTLINES ARE FROM NEGATIVES BY MESSRS. IRELAND AND LOWDEN.

(as, for example, in M. Trouvelot's picture, fig. 2), really terminated in branching forms. The beginning of this trumpet-shaped extension is shown in fig. 6, but is more plainly displayed in fig. 5, where I have traced only the outlines of the corona, as shown on the negatives of two amateur photographers, Messrs. Ireland and Lowden. These negatives are confirmed by others, especially by the admirable pictures of P. Charroppin, and also by a naked-eye sketch made by an artist. They show an extension to the corona which had never before been photographed. It had been seen in 1878 by Professors Langley and Newcomb, but its true shape had not been suspected by them.

I consider, then, that the main photographic

Messrs. Burnham and Schaeberle of the observatory, aided by a volunteer observer, Mr. Rockwell of Tarrytown, made the journey to Cayenne, and under somewhat unfavorable conditions secured excellent results. No engravings from their pictures are given here, as they do not differ greatly from fig. 4, and as they are to be printed elsewhere. It suffices to say that the records of the December eclipse were comparable with those obtained in January. Other expeditions were sent by the National Academy of Sciences of Washington and the Royal Astronomical Society of London to Africa, and by the latter body, and also by the Paris Academy of Sciences, to South America. The day was cloudy in Africa, and no results

FIG. 6. INDEX DIAGRAM MADE FROM THE LICK OBSERVATORY PHOTOGRAPHS OF JANUARY, 1889.

results of the January eclipse were two—that the polar rays extended all round the disk, and that the corona was extended in a trumpet-shaped form. These results were merely the records of fact, and however important the facts might be, we seemed to be no nearer to the solution of the questions: What is the corona? Why has it such a shape? Why does it vary in form, and according to what laws does it vary?

The excellent photographs of the January eclipse made it highly desirable that the eclipse of December, 1889, which was total in Guiana and on the west coast of Africa, should be observed on the same principles. The small income of the Lick Observatory did not allow us to send out a party, and the plan had been reluctantly abandoned, when Mr. Crocker, one of the regents of the University of California, generously offered to bear the whole cost of an expedition to South America. Accordingly

were obtained. The results secured by the English and the French parties in South America add nothing to our own. The two eclipses of 1889 were thoroughly well observed, and the records of the appearances and structure of the corona were plain; but the vexed questions still remained: What is the corona? What are the laws of its variation of shape?

These questions have now been answered by Professor Schaeberle of the Lick Observatory, in his "Mechanical Theory of the Solar Corona," just completed. It is possible by this theory to account for the general form and characteristics of all past coronas and to predict the general form of future ones. A solar eclipse will take place in 1893 on the coast of Brazil, and Professor Schaeberle is able to give a drawing of the general features of the corona as they will appear at that time. It may be said that the fundamental law is now established.

There are minor matters to be studied, but the explanation of the long-standing mystery of the corona is now in our hands. Like all great things, it is extremely simple, and in its principal points it is easily understood. I shall speak only of the main points in this place, leaving the particularities to be treated in more technical publications.

To understand Professor Schaeberle's explanation, let us recall a few facts of observation. We know that the sun turns on its axis once in about twenty-five days. Its equator remains always in one plane. The earth revolves about the sun in a plane which is inclined to the plane of the sun's equator by about seven degrees; that is, the earth is sometimes seven degrees above (in September), sometimes seven degrees below (in March), the plane of the sun's equator. The effect is that sometimes one pole of the sun, sometimes the other, is turned toward a spectator on the earth. Now we know that the sun is covered with spots, confined to two belts which roughly correspond in situation to the temperate zones on the earth. These belts may be compared to regions covered by geysers which are perpetually sending out matter from their interiors. This matter is shot out perpendicular to the surface with high velocity—something like three hundred to four hundred miles per second. Now, if the sun did not revolve on its axis, we could make a model to represent this state of things by sticking straight needles into a sphere of cork all around the temperate zones. The needles would represent the streams of matter shot out from the solar surface. But the sun rotates on its axis, and therefore the needles in a proper model must be curved and not straight.

Professor Schaeberle has calculated the true curvature, and it is quite possible from his figures to construct a model of the sun with its outgoing streams of matter. We have simply to take a globe of cork, and to insert many wires of the proper curvature at something like equal distances from one another all over the surface of the temperate zones, where we know that the solar activity is manifested. It is a very curious fact of observation that sun-spots are never

seen near the solar poles, and very seldom indeed in high latitudes. Such a model will represent the sun and the solar corona as they really are—but not as we see them. For a spectator on the earth is sometimes above, sometimes below, the plane of the sun's equator; or, to put it in another way, the sun sometimes turns its north pole, sometimes its south pole, to him. If, then, we place our model on a stand, and place the eye where the earth should be in its orbit at the time of an eclipse (according to the month of the year, etc.), we shall actually see the curved needles overlapping and interlacing by projection and by perspective exactly as the streams of matter overlap and interlace. If we go far enough away from the model to lose the view of the individual streamers, we shall see the outlines of the corona, with its polar rays, its interlacing streamers, its trumpet-shaped extension, precisely as they have been depicted in the photographs and drawings of past eclipses, or as they will be shown in future ones. The polar rays are caused by the overlapping of streamers which have their bases within the temperate zones, but which are long enough to project *beyond* the sun's disk above or below it.

The records of all past eclipses have actually been examined according to these principles, but in a more accurate way than by a model, which is, of course, used only for illustration, and they are found to agree with the theory. The predictions for future eclipses simply require us to know at what day of what month the phenomenon will occur.

In a general paper like the present I am obliged to omit any account of many interesting consequences of this theory, which relate to the periodicity of the solar spots, the zodiacal light, the aurora borealis, terrestrial magnetism, etc., and to confine myself to a simple relation of how the external appearances and the characteristic forms of the corona are explained in an extremely simple and beautiful manner. The corona is no longer a mystery. Its characteristic forms have been accurately recorded on the negatives taken in 1889, and the explanation of Professor Schaeberle accounts for the occurrence of these forms in the past, and enables one to predict them in the future.

Edward S. Holden.

"THE SHADOWS FOLD."

THE shadows fold; come back as of old,
Shine, Helen, girl with the head of gold.
As the moon from the sky overcast
Bursts into the open blue,
Out of the cloudy past
Push your bright body through.

The shadows fold; come back as of old,
Once more glow over me, head of gold.
Burn back to your place on high,
Flame there, for my heart to see:
O Helen, my youth's blue sky,
The heavens you made for me!

John Vance Cheney.

CHARACTERISTICS.

BY S. WEIR MITCHELL, M. D., AUTHOR OF "IN WAR TIME," ETC.

XII.

WHEN our Sunday evening talks chanced to be at Vincent's I was always well pleased. The addition of Mrs. Vincent seemed to bring out all the peculiar qualities of each of us, as a ripe peach before your best Burgundy enlarges your knowledge as to how one pleasant thing may mysteriously increase the power of another to give delight. If you were happy enough to be liked by this woman, you were made to feel when with her how gladsome a thing life may be. And this, too, in a sober way, for there was in her fashions a pretty tranquillity, and only rarely louder mirth. When she smiled, it was, as St. Clair quoted,

"As when an infant smiles,
Not at but with you."

For her smiles were never employed for unspoken cynical comment, nor to hint the thing she dare not say.

I remember hearing her husband remark that she was more apt to laugh when alone, and her answer that her smile was for all, but that her laughter was private property.

This puzzled Clayborne, who insisted that Saadi had said, "The wise smile, and the fool laughs."

Mrs. Vincent retorted, "Then I am wise only when in company, and a fool when alone, which is a proof of wisdom."

However, St. Clair, liking to tease Clayborne, said that he knew Saadi well, and that the quotation was an invention. Upon which Mrs. Vincent insisted that for a man to quote himself was the same as quoting some one else, because men were never the same from year to year. Clayborne, confused by her nonsense, as usual retreated into himself to examine the proposition seriously, while she and St. Clair exchanged unspoken signals of childlike delight.

She was sure, however she teased him, to send the scholar away in good humor, and I confess that for me she had the effect of a glass or two of champagne, and kept me wondering at my own cleverness.

She had, like many nice women, a taste for

the *mise en scène*; but this was instinctive, and probably unsuspected by herself. For the rest, she understood her husband, and was his best friend and lover. I do not think she liked women as well as men, but it pleases me that she never said so. Her housekeeping was mysteriously perfect. She had one accomplishment, a noble voice in speech and song; and one grief, the absence of children. I fancied myself her best friend, but I was never her physician, for she said, "I could not have my friend for my doctor"—a not very rare feeling among women.

When I came in she was seated alone, reading, and, the evening being warm, was clad in white, with delicacies of lace here and there. She wore, as usual, no ornament, but behind her, on the table, so that the strength of her head was set against them, were several bowls of roses; and at her feet, on a low stool, stood a large, flat Moorish vessel, also full of flowers, on which she was gazing with distinct pleasure, her book lying open on her lap.

"What! Alone?" I said.

"Yes; we have had a discussion on folly and wisdom. Mr. St. Clair said a happy fool was better off than an unhappy wise man. Mr. Clayborne insisted with solemnity that a really wise man could not be as unhappy as a fool, other circumstances being equal. Then I quoted, 'There's no comfort in wisdom, and no satisfaction in folly; for all that the former can do is, in some passage or other of matchless eloquence, to call the latter by her right name, after which she will dwell as contentedly your mistress as before.' I could not tell whence it came, and nothing would satisfy him but to take Fred down to the library to look for it, and the poet to help them. Sit down; they will not be long. You did not come to dinner, after all, and Miss L—— was so charming."

"Ah, my dear lady, how many of these charming women have you bidden me to see? I come, and talk, and look at them, and could classify them."

"You must not. This one was really all that I say."

"But you have said nothing. I wait."

"Well, she is not very pretty. She never says what you expect her to say, and seems always about to say or do something that might seem—well, a little pronounced. Yet she never does really do or say anything that the best bred

might not say or do. She has 'eyes that do not know their own solemnities'—eyes of heaven and a mouth of this earth."

"Fair food for saint or sinner," I said. "But, really, I could not dine with you, and I should like to see this woman. When shall it be?"

"People who decline my dinners never, never make up their loss on this earth."

"I will never dine here again," I cried, laughing. "What are you—what were you reading?"

"St. Clair's new book; he brought it to me yesterday. Have you seen it?"

"Yes; but only the outside. What is it?"

"A dramatic poem called 'A Life.' A man sees a woman in her youth. They are in love, are separated by the inevitable, meet once again in middle life for a day, and once more when both are old. The interest lies in what they say of life and its intervening experiences. I am puzzled by the large knowledge he displays of a world he has never seen save in mere glimpses."

"Indeed, but does not that often strike you in the work of genius? A friend of mine told me Lewes once said to him that George Eliot never, to his or her knowledge, had the experience of physicians which enabled her to put on paper Lydgate, the only perfect characterization of a physician in fiction. Indeed, she had said as much to a man well known on the turf as regards the low turfmen in the same book."

"And can you explain it?"

"My friend said in reply, that although Mr. Lewes, for example, might know little of serpent-worship, that were he able to recall all he had ever heard or read of it, he could write on it a book of great learning. He thought that we must presuppose in genius the capacity to reassemble by degrees a host of minutiae for use at need."

"We all possess more or less of this. We set an idea before us, and by and by we are amazed to find how many ghosts of things apparently forgotten are summoned by this steady call upon associative memory. It is as when you drop into a solution of numberless salts a crystal of one of them. The formed solid begins at once to gather for its increase all the atoms of its kind."

She was silent a moment.

"Well?" I exclaimed.

"Oh, I was only thinking over your illustration to see if it helped me to understand any better. Perhaps it does. Illustrations in argument often serve only to puzzle me. You know P——?"

"Yes."

"His talk is a constant rosary of illustrations, or of illustrative comparisons, which merely be-

wilder. Before you have mastered one of them (and they are always clever), he is presenting you with another. But about genius in characterization, there must be also some power to do far more than memorize. There must be power to reject and modify assembled memories, so as at last to create that natural oneness of the being described which ends by making a living thing, not a mere photograph."

"Yes, there are plenty of bright books nowadays in which a man represents people he knows; but that is bad art. Usually it begins and ends with one book, which excites false hopes of a brilliant career in fiction. Abidingly true power to characterize in fiction is automatic."

"Oh, here they come. And did you find the quotation?"

"No; we think you invented it," said Vincent.

"Not I, indeed."

"And are we to have the two manuscripts to-night? I vote for the Russian story first. Did you bring it, Mr. Clayborne? The title excited my curiosity—"The Moral Tontine."

"I brought it, but I have no power to translate so as really to render the spirit of the thing. I—well, really, I would rather you let me off."

"Oh, but you promised. What was it about?"

"Yes," said St. Clair; "you are in the toils. We insist on hearing."

"It is quite too absurd," said Clayborne.

"Then we shall see you in a new character," cried St. Clair.

"You shall have no tea," laughed Mrs. Vincent; "not a drop."

"That decides it," cried Clayborne. "Intelligent law proportions the punishment to the crime. I shall spoil the story, but no matter, I can't lose my cup, my three cups, of tea."

When we were quietly seated and ready, he said: "This is

"THE MORAL TONTINE."

"THE mysterious sides of Russian life are little known to the West. Nowhere else do certain forms of mysticism secure so many serious converts. Some of these peculiar beliefs have been historically long-lived; others come and vanish. The singular story I am about to relate concerns one of these strange societies. It is taken, as I give it, from a rare book by Leresky, a Pole of great learning, who has investigated these curious associations, and whose book was suppressed, and is now difficult to obtain. He was enabled to see the proceedings of the circle or society which concerns my tale, and from them copied this illustration of the views held by the members.

"He abbreviated it in the telling, and it no

doubt loses something by his abrupt way of relating what might with more art have been made interesting."

"One moment," said Vincent. "Did the Polish historian believe in the story?"

"Yes; he was himself a mystic. He gives evidence as to its occurrence, but makes no effort to explain it."

"And do you yourself credit it?"

"I!" said Clayborne. "Let me first read it. We can discuss it afterward."

"And I," cried Mrs. Vincent, "can wait no longer."

In the province of Vasilyskoosky were the headquarters of the secret society of the Kasilylnza. This group of people traced their origin far back into the night of Russian barbaric time. They believed that lingual expression has interfered with the more natural and closer means of mental intercommunication, by which soul may come into contact with soul. For the purpose of recovering the lost powers of man, these mystics were accustomed to take vows of silence, and to live together in pairs, abhorring speech, writing, and even signs. They believed also that for devoted natures it was possible to exchange for a time, or permanently, mental or moral qualities. This was brought about by an effort on the part of one man to eject from his mind a quality like courage, while the other man became passive and simply receptive. Thus a surplus of virtue or vice was gotten rid of, the object being the general good of man.

The center of this strange creed was the capital of the department, Notsob, and here they continued to meet, and to elude the police, who considered their views to be dangerous to the public good.

"Of course you will understand that all this I consider nonsense. It is much more in North's line than mine."

"Thank you," said I. "Go on."

"It may interest you, North, to know that the same process by which a man got rid of an excess of temper applied also to disease. The one man willed to lose his ill temper; another accepted it by mental effort. After some days, or at times abruptly, the former man's temper returned to him ameliorated by having dwelt in union with the nobler qualities of a man trained to self-restraint. And so also of disease; the same process being repeated over and over, as between the ill man and many well ones, his disorder was enfeebled by distribution until no one possessed enough of it to do harm."

Dr. Skoblowitsky, the second regent of the society, discovered that it was possible to in-

fluence disease at a distance, so that a man in Warsaw might be receptive at a set hour for one in Irkutsk, and, also, what was stranger, that the difference in time made by the longitude of two places disappeared as a hindrance before the potency of the double exercise of two wills. But all of this has little to do with the incidents of my story, which Dr. Skoblowitsky describes in his chapter of proofs of the power of the double will.

It is related, in connection with some of the statements as to certain of the later discoveries made by members of the "Council of Minds," just before the police finally broke up the association in 1783, that at this time Dolinkovitch, the chief councilor, announced his belief that as the qualities of mind and morals involved distinctive entities, grouped for use in the republic known as man, these must be scattered by death. Some means, he conceived, might be discovered of utilizing and securing for the living man such of these faculties as, dislocated from the rest, and set at valueless freedom in spiritual ether, would otherwise cease for ages to be means of good.

It was found at last that by proper exertion of will power a man about to die could convey to one alive the dominant qualities which he himself possessed, but that those of which he had only a minor share could not thus be transferred. A prearranged acceptive willingness on the part of the recipient was alone needful for his share of the transaction.

Several curious illustrations are given of the workings of this method. Thus, the Russian poet Vasiloe Amgine, known as the Slavonic Poe, willed his imagination to his friend, the great German algebraist Von Heidenbrugger, and in consequence of the fact that two sets of qualities came thus to exist in the same being with equality of force, the mathematician wrote a superb ode on the square root of x raised to the ninth power, and was in consequence put in the asylum at Cracow.

Other as sad failures, however, did not deter three men of the lower circle of the society from agreeing that as each died his best faculties were to become the property of the survivors, it being supposed that as they were all people of varied endowments the survivor of this intellectual tontine would end by possessing such force as would raise him to eminence.

Count Ortroff, the youngest of the three, was a man of great personal beauty, and endowed with a rather light mental organization; apparently, one of those butterfly natures which are generally acceptable, but incapable of profound affection. He had too easily captured the heart of his cousin, a woman of force and remarkable charms, but quite too well aware of the slightheadedness of character of her lover. The

engagement was broken off by a singular incident.

One morning in May Count Ortroff became suddenly aware of a change in himself. He awoke to a sense of vigor and activity of mind and body unknown before. Commonly gentle and confiding, he felt now a sense of desire to be aggressive, and scolded his valet because he had ventured to inquire of him whether he would ride or drive to the princess's country-seat.

All that day he felt himself a victim of contending forces. He was for the first time aware of being deeply in love, and astonished the princess as much by the unwonted manifestations of passion as by abrupt outbreaks of vehement criticism of various people. As a rule he was gentle, refined, and most suave of speech, and to this his easy nature inclined him. Also, he had known himself to be so wanting in courage that he regarded the possible consequences of a quarrel with terror, and had declined to enter the army. His life was spent in concealing this painful defect of character.

After seeing the princess he remained at home for two days, reflecting on the sudden changes which had made him an irascible man and a passionate lover, and had also, as it seemed, lifted him into a higher intellectual sphere. In his amazement he consulted the chief councilor of the society, Ivanovitch Dolinkovitch, who said at once, "But was not yours the No. 27, Moral Tontine?"

"Yes."

"Then you should have prepared yourself to assimilate usefully the moral and mental properties of General Graboskovitch and Captain Viloff. You could by continuous effort of will have been ready to decline to entertain in your soul their bad qualities, and to welcome their better ones. You have been loosely and thoughtlessly acceptive. It is now too late. I was always fearful that your soul was of low specific gravity. The general died four days ago. I suppose that the more receptive nature of Captain Viloff secured the dead man's courage; without it his aggressiveness would have long since gotten him into trouble. You must be careful."

"Alas!" said Ortroff, and went away in despair.

A few days later he received a letter from Viloff. "I hear," wrote the captain, "that No. 2 of our tontine is gone. I am distressed to feel that I come in for no addition to my mental force, and that I have obtained only an excess of courage and an absurd indifference to danger. All gentlemen have courage enough; you will not need that, but if by ill luck you have inherited the general's obstinate pugnacity, I am sorry for you."

"And I," said Ortroff. "I must indeed be careful."

A few days later, at a ball, a gentleman offered some trifling slight to the princess. Ortroff was present. An irresistible impulse seized him. He followed the man from the hall, and struck him. Instantly an agony of fear came upon him; a duel was of course unavoidable. He sat up all night, and on the field next day displayed such signs of cowardice that his seconds declined to act. He apologized to his scornful foe, and a few hours after drove to the house of Dr. Dolinkovitch, to whom he related his trouble. The doctor was both sympathetic and interested. At last he said: "You have only to follow my advice. Go to the chief hotel and take rooms. To-morrow get up late, and go into the street in your shirt and drawers. The police will arrest you. Ask if it is midnight, and say you want them to find me, that I know your watch is out of order. They will send for me, as I am the police surgeon. You will act wildly, and I will send you to an insane asylum. In two months you will come out well, and your failure will be regarded as having been due to mental disorder."

Ortroff hesitated, but a note from the princess breaking off the engagement determined him, and the next day he followed out the doctor's advice to the letter, and was sent to an asylum. His friends and family gladly accepted the excuse, and took care to circulate it widely.

After two or three months he returned to his estates profoundly depressed. A week later he became aware of a new change. The acquisition of the vigorous intelligence of the general had made even more painful the sense of his own defect in courage, and the whole affair of the duel had troubled greatly the members of the circle, who had been much attached to him by reason of his sweetness of character and gentle manners. These, in a degree, had suffered by the inheritance of General Graboskovitch's soldierly roughness and shortness of temper. But fear of his own defects, together with his newly acquired acuteness of mind, had somewhat enabled him, as time went on, to control and modify them.

But now, again, there was a change. Captain Viloff, dangerously stimulated by an overplus of audacity, had been again and again wounded, and at last in a desperate night attack on the frontier was mortally hurt. The news already found Ortroff a new man. Indeed, before he heard that he was the surviving heir of the qualities of the other two members of the tontine, he had begun to feel the influence of the quality of courage which the two dead members possessed. The results greatly interested the circle. Again the count

was seen in the neighboring town, and every one except the members of his secret society was astonished to hear that he had called out his old antagonist, had explained to his seconds that his fear was only the coming on of his mental trouble, and had badly wounded his opponent. As a result every one called upon him, and with perfect calmness he himself went to visit the princess.

She received him coldly. Her notable intelligence was dominated by immense tenderness, by all the self-sacrificial qualities found in many women, and by a feminine adoration of masculine beauty. These had twice involved her in love-affairs with weaker persons of the male sex, and now her chief difficulty in renewing her promise to marry Ortroff arose from the fact that he seemed to possess the stronger will, and no longer appealed silently to her sympathies by his gentleness and instability. She replied to his passionate wooing that she could not marry a coward.

"But I am not. I will submit to any test," he assured her. "There is my duel. I was, of course, insane." At this she smiled incredulously.

"I do not know now whether I love you or not. Give me six months to reflect, and—and—bring me the order of St. George won on the battle-field."

Then she kissed him, and fled from the room.

Six weeks later, he was mortally wounded in the desperate struggle of Olnovina, and a friend brought the princess the cross which the emperor left on his breast as he lay dying in the hospital at Yasilloff.

"What a cruel ending!" cried Mrs. Vincent.

"It was a good exercise in Russian," said Clayborne, as he cast the manuscript on the table. "North would have rendered it better. I hope it has amused you."

"Oh, amused! No," returned Mrs. Vincent; "it has interested me. I wonder if there can be any foundation for it."

"My wife has a coy interest in mysticism," laughed Vincent. "She enjoys a little flirtation with the vague."

"Then never could a flirtation with you have delighted her," said I.

"No, indeed," she cried; "he is atrociously definite. But what is there vague about all this strange story? It seems to the man who tells it to have happened."

"I think it in a measure explicable," I returned. "The doctrine of suggestion might—"

"There, don't explain it," she broke in. "I shall wait the demise of some of my friends with interest. Be it true or not, I understand the woman."

"I do not," said St. Clair. "How could a

highly intelligent woman care for a man as feminine as he?"

"And you of all people! You, who worship personal beauty!" said Vincent.

"I am answered," cried the poet.

"No, not fully," said Mrs. Vincent. "And still, as for myself, although I understand the woman instinctively, I cannot explain."

"That is not understanding," said Clayborne, in his blunt way.

"Possibly not; but I decline to betray the secret counsels of my own sex. And here is your tea. One lump or two?"

The little chat had amused me, as, glancing at Mrs. Vincent's face, I had seen it flush faintly. She had been twice engaged before she married my friend, and, until then, her favored lovers had been men beneath her both in mind and character. She once said to me, "When you come at last to pay the debts contracted by that idiot Pity, the little god is apt to put up the shutters and declare that he is not at home for business." I should have liked to hear more from her on this subject, because the love-affairs of the best women are often inexplicable to men, and perhaps also to the women concerned. I ventured on one occasion to ask her a leading question on this serious matter. She said, smiling, "Have you not observed that clever women are apt to have more than one serious love-affair?"

I said that I had made that not difficult observation.

"Ah, well," she said, "I will make it clear to you. The answer to any one such drama is in the next."

"That," I said, "is delightfully lucid—to a woman."

As I sipped my tea I turned over a book of etchings, while our hostess went on talking the prettiest mere society nonsense to St. Clair and Clayborne. Her husband, much amused, sat by. Now and then she darted at him a swift glance of fun, or sought his eyes with a look of questioning eagerness. Whatever ideals had once been hers, she had found a trusted anchorage in the man she married. Indeed, I think the admiration she excited was one of the happinesses of Vincent's existence, and in every relation the perfect tact with which these two managed their common life was a pleasant thing to see. Like many kind and able women, dullness was for her no barrier to friendship; but to none was Vincent so charming as to her uninteresting friends, to none so generous and so courteous. She repaid the debt in kind to us all, and, as to St. Clair, was a sort of confessor to whom he confided his occasional troubles with a quiet childlike certainty of help. I think that she did not much fancy Clayborne, but the art of absolute social

masquerade belongs to the woman alone, and I doubt if even Vincent suspected her of caring less for the scholar than for her husband's other friends. Hearing the talk take a more serious turn, I drew my chair nearer.

"Yes," said Vincent; "a nation in the making is as to its individuals more interesting than one which is set in slowly changing historic ruts. As a rule, the English people—I mean the undistinguished—are to me of all the dull-est. The chance American of any class, as one meets him in travel, is by far more amusing. I don't speak of his manners; he is apt enough to be common, just as the corresponding Englishman is to be vulgar; but class for class, our people interest me more."

"But how silent they are."

"Yes; yet open to talk if you ask for it. We had once the name with our cousins of being questioning creatures, but really I think that of late years we have exchanged rôles. Certainly the frank inquisitiveness of the English is past belief."

"If," said St. Clair, with his easy way of dislocating the talk, "I had to attend to the education of a nation, I should declare a war once in every fifty years at least."

"I don't care myself to manufacture any more history," returned Vincent; "but certainly the generation which emerged from our great strife, North and South, was the better for it."

"And what faces it wrought!" said St. Clair. "I stood and saw go by me in Washington that army which followed Sherman to the sea—grave, thoughtful, strong-featured, with eyes looking homeward."

"And behind them the dead of countless homes," said Mrs. Vincent, "and that desolated, mourning South. Let us talk of other things; I cannot even now think of it without pain."

"It was but the historic consequences of folly and crime," said Clayborne.

She made no answer except in her gentlest tone to ask me to ring for the servant to remove the tea-tray. I knew that one of her brothers, long settled in the South, had lost his life in the Confederate cause, and I could have soundly cuffed Clayborne, who never remembered anything not in books. Now he rose to go, as we decided that it was too late to hear the "Memoir"; but then, retiring to a corner, as though he had forgotten his intention, sat down to read the nearest book.

St. Clair, who was greatly attached to Mrs. Vincent, noticing the slight look of pain which still lingered on her face, said, "You have been glancing at my little book."

"Yes. Read me something." And then—and this was quite characteristic—"I should

like the lines on Lincoln." He took up the book and read:

Chained by stern duty to the rock of state,
His spirit armed in rugged mail of mirth,
Ever above yet ever near the earth,
Still felt his heart the vulture-beaks that sate
Base appetites, and foul with slander wait
Till the sharp lightning brings the awful hour
When wounds and suffering give them double
power.

Most was he like that Luther, gay and great,
Solemn and mirthful, strong of head and limb.
Tender and simple was he too; so near
To all things human that he cast out fear,
And ever simpler, like a little child,
Lived in unconscious nearness unto him
Who always for earth's little ones has smiled.

"Thank you," she said. "And one more before you go."

"This is not mine, but a friend's. He has a certain terror of publicity, but you will see at the close of the book I have put together a few of his verses. They have a fineness of quality I like. He does not write for the world, but as you write to a friend. He has pleasure in the clear coinage thought finds only when on paper."

"I think I know the man," she said. "And thank you again."

"Shall I read any more?" he said.

"Yes," she answered; "if you will be so good."

He took a book from the table, and read aloud the first half of "Saul." As he read I watched him and her. He seemed to know he was soothing her, that this was what she needed. He read the poem as a boy explores a fresh stream or wood, with thoughtful joy, and as though he had just discovered it all, and was sharing it with you. As he turned the last leaf, she said quickly, "Do not read the second part."

"No danger of that," he said. "I think that at a certain age the poets should be retired on prose pensions."

"And who shall set the date?" said I.

"Not I," she replied; "and yet—and yet—"

"Well, what?"

"Merely that I feel now as to this poet as one feels about a friend who, as life goes on, ceases to be what he was, and becomes something else which is no longer grateful to you. You knew and loved him when only a few others understood him. And now, when he has won the adulation of the literary populace, you can only look on, and wonder with a little sadness at the character of the development which time has brought about."

"It is true," said St. Clair. "Once I went to a society, and a gentleman in the dry-goods business unrolled for us a mummy. He ex-

plained the processes of embalming and the spices used, and then the object of it and its relation to the solar system and to the manufacture of oleomargarine. He told us, too, how the Egyptians embalmed geese, and, reverting to his mummy, made plain to us that, having exposed the body thereof, it was found that it was not always possible to decide its sex or nature. I think I must have been half asleep, because, just as he assured us that this state of bewilderment was the main value of the study of mummification, and that it was a wise invention of beneficent priests to train, through vexation, the intellect of the future, I woke up and knew that he was discussing 'Sordello' with occasional allusions to Mr. Sludge."

"I never before knew you half so cynical," said our hostess.

"Really, I have not put it too strongly. These societies for the infinitesimal dilution of criticism are exasperating. How the poet must laugh in his sleeve! My only comfort is that we did not invent the craze. There is a true story that an Englishwoman broke off her engagement with a sturdy guardsman because he did not know who Browning was. She took the man back again into favor when he was able to stand an examination on 'The Flight of the Duchess,' and 'The Red Cotton Night-cap Country.'"

"At least now, for a while, they will let my Shakspeare alone. They have fresher prey."

"That is curious," said the poet. "Did not you see, Clayborne, that lately in repairing Shakspeare's tomb there was found on the under side of the marble slab the lines,

"Who stirs the ashes of my verse
In his soul shall roost a curse?"

"What? what?" cried Clayborne. "Nonsense!" While the rest of us smiled, and the poet, who delighted to mystify the historian, burst into childlike laughter.

"In my young days," said I, "the business of dissecting dead poets had hardly begun. When but a boy I asked a mild old professor what Shakspeare meant by 'Marry, come up.' He reflected a little, and then said it meant merely advice to marry, and indicated the elevation of soul which would follow."

"But he was jesting at you."

"Not at all. He was quite vexed at the smile of an elder boy who stood by, and who cleared my head about it when we had left the classroom. I could tell you my critic's name, but I will not."

"Don't you want sometimes," said Mrs. Vincent, "to do to your books as the Russian censors do to newspapers, and blot ruthlessly some parts of them? If a human friend is silly, or

wanting in some way, it is not thrust on you forever; but the folly of our friend-book we cannot escape. One must take our friend-book as all friends must be taken, with reasonable charity as to defect and limitation."

"A noble old man whom I know well," I said, "has had printed for himself in a book all the bits of verse he loves best; the little poems, the old ballads, he fancies; whatever taste, circumstance, or remembrance has made dear to him."

"That really is a good idea," said Mrs. Vincent. "Could n't I do that, Fred?"

"Readily," he said, with a smile. "The book might be a trifle large. And shall it be only verse?"

"Oh, there must be two; I cannot mix them. And a book or two there are I can't have in chips. By the way, is n't this a charming thought?" And so saying she gave me from the table a little copy of Marcus Aurelius. It was uncut, and tied to the long ribbon marker was a paper-cutter having on its handle a coin stamped with the features of the great emperor and greater man. I knew in a moment who had given it by St. Clair's pleased look.

As I studied the grave face on the coin, Mrs. Vincent said: "I am waiting to cut the leaves. I did begin, but then fell to thinking of the emperor man guiding my fingers through his own immortal pages, and how some Roman boy, playing at pitch-penny with this coin, may have paused as the emperor passed, and turned to see if the medal were like him or not. I shall wait."

"Would he have been more great, or less," asked Vincent, "but for the woman, his wife, who had no sense of the moral stature of the man?"

"I do not surely know," she answered. "Women may immensely help men, but the strong of purpose even a bad woman does not mar. The best and the greatest have had bad luck with wives. The women who can worship the heroic, and yet use their own common sense usefully to criticize the hero—oh, they must be very rare indeed. And as to that book, I think I shall rest content with my present plan."

"And that?" I said.

"I keep near me on my table a few books, three or four—real books, I mean; books that are in the peerage of thought. They are as friends invited for a limited stay. Some day they go back to their home on the shelves, and others are invited to their places. But I meant to ask you how such a man could have had a son like Commodus."

"His father," I replied, "had virtue lifted to the height of genius, and genius is not heritable. By the by, a great Frenchman has said that is why genius is not akin to madness, since

madness is so apt to descend with the blood. And there, too, was the mother."

"And so," said Mrs. Vincent, rising, "the blame is to fall as usual on my sex. I shall leave you, I think, to your cigars. I have exhausted your wisdom. Good-night, and thank you again, Mr. St. Clair."

She rose, and she left us.

A few minutes later, Vincent said, "Have you guessed the man St. Clair's friend describes in that little poem? Do you know him?"

As he spoke I saw the sculptor look up with a gleam of amusement in his face. "Oh, it is a character; merely a character."

"I fancy I know the man," I returned. "I mean to respect his incognito. More might be said of him. He was, when first I saw him, a rather narrow person, but it was the narrowness not of parallel lines, but of a broadening angle sure to enlarge. In all ways his life has widened with the years—his tastes, his charity, his intellect, his power to please and be pleased, his range of sympathies. As a young man he was cynical, at least in talk, which is sometimes far enough away from the cynicism of action. We used to call him bitter, but some able men are in youth like persimmons, and ripen into sweetness under the frosts of circumstance."

"The men," said Vincent, "who reverse your comparison, and, facing all their lives a lessening angle, narrow to the point called death—we know them also."

Said St. Clair, "Let us hope that the crossing lines create for them too the widening angle of larger growth."

XIII.

THE account I had so long promised my friends of the character-doctor was delayed by a variety of matters. But one evening in the winter we met again at Vincent's. When I came in the room was ringing with the notes of his wife's voice. She had set for St. Clair a little love-song. Her voice had the rare charm of rendering the words with perfect distinctness, and the music was such as prettily to humor the sentiments of the verse. As she finished, he took it up and read it in his fervid way.

"Alas," he said, "we have lost the art of song. The gaiety and self-abandonment of its Elizabethan notes are dead for us. All the pretty silliness of it—its careless folly, and its gay music—rings with the life of that splendid day. Think of the lusty vigor of it, the noble madness of the lives. Imagine the struggle for national existence which made poets soldiers, and gave to life that uncertainty which makes man natural and outspoken. Here was a queen who, whatever her faults, had the art to get from noble men an ever nobler service; a woman who somehow influenced men toward

greatness as surely as her 'sister of debate' made worse all who loved her."

"Oh," laughed Vincent, "we should have Clayborne give you his cold judgment of Elizabeth."

"And almost all he would say is true," cried St. Clair, "and yet but half the story. It wants a poet for entire estimate of the values of character. Your sweet, gentle, merely lovely woman makes on man no permanent impression. There must be force somewhere to evolve force. A very feminine woman with some flavor of the resoluteness of the masculine character has the trick to keep men steadily influenced, and there must be, too, the high-minded sympathy with heroism—in fact, some touch of that quality in the woman herself."

"I meant," I said, "to have added a word to what St. Clair said. England was musical in those days. Without that the song has no natural birth. Music died, and the song with it, as Puritanism grew to be a power. It was lucky for Germany, I think, that Luther loved music."

"The thought is interesting," remarked Clayborne.

"Yes," said Mrs. Vincent. "But to go back to our last subject. One of these days I mean to write women's husbands. A calm statement of our side might be valuable. I should take as my title-page motto the wise words of a friend of mine, 'Men differ, but all husbands are alike.'"

"That would begin and end your book," I said.

"Oh, the husband is generically alike, but specifically various. You may smile, but wait until you read my chapter on the management of husbands. However, I do not mean to spoil my literary venture by talking about it."

"Give me a few points," laughed St. Clair. "At any time I may become a victim. I cannot imagine it, but everything is possible."

"Might I protest?" cried Vincent.

"No, indeed," we said in one breath.

"Oh, it will be quite impersonal, my dear," she said.

"Well, and suppose we question you?" said I. "Is marriage, as we see it, a failure?"

"What a question! Is business? Are books? There are three marriages. One is a monarchy; a king or queen presides over life. One is a true federative republic; there is equality under large sense of law and of mutual rights. The third is anarchy. Time is the true priest. Many couples who seem unfitly mated learn as years go by to find the happiness they miss at first. There are people who ask too much of life. Sometimes they fail as to their own ideals and get what is better. I shall have a chapter on the friendship of marriage, and one on its disappointments."

"And one," said Vincent, "on the marriage of friendship."

"Might I say of that," she returned, "that if not a marriage of *convenience* (for it is more than that), it is, at least, a marriage of convenience?"

"Good!" cried I.

"And now we are going to hear something more; it is interesting," said St. Clair.

"No; I elect to pause here. I give you only one piece of advice."

"Well?"

"Don't marry a fool. If you would only let me choose for you."

"Agreed," said St. Clair, "if I may have a veto."

"By all means. But—"

At this moment Vincent's servant came in with a note for me. "Pardon me," I said. "Your revelations must keep, at least for me. I have to go to the hospital. I may be gone a half-hour, or much longer. Good-by, Mrs. Vincent."

"I am sorry. I had set my mind on a pleasant evening."

"What is your errand at St. Ann's?" said Vincent, as I rose to go.

"A consultation with the surgeons."

"Might I go with you?" said St. Clair.

I looked at him, astonished. "Well, yes," I returned doubtfully. "But you may have to wait long if you remain until I can leave the wards. What on earth, my dear St. Clair, can you want now, at night? There is nothing to see."

"I will tell you as we go. If you say no, I shall be satisfied."

"Very well; come, and make haste," I said, as the others bade us good-night.

Presently, as we walked along, St. Clair said, "Your note told you that a man was probably dying. An operation might save him."

"Certainly."

"I want to see death. I want to see a man die. I never saw that strange thing. I have two reasons. One is related to my art, and is not an unworthy reason. But also, North, life is an immense happiness to me, and I feel some strange craving at times to see its misery, its darker side."

"Great heaven! It is all around you."

"Yes, no doubt; but I cannot grasp it. If I help a beggar, his satisfaction alone goes with me. I can be sad on paper, but nowhere else. It seems to me, as I reflect, unnatural, wrong. I think I realize grief and pain and trouble for others, but not as a thing possible for me. And this great awful fact of all life—death—I must see it."

I did not reply for a moment. Then I said, "Perhaps you are right. I am not sure. But you shall have your way."

"And death," he said, "you must have seen it until it is commonplace to you."

"I have seen," I said, "countless deaths in battle, executions, death-beds—men, women, children. It has never quite lost for me its awfulness. The materialism which makes it seem the mere stopping of a machine, into which I once reasoned myself, lessened and left me long ago. Once, by a death-bed in a hospital, I heard a surgeon say, as a man ceased to breathe, 'It has stopped; the engine has ceased to go.' His senior, an old man, replied, 'No; the engineer has left it.' I have ceased to reason about it. At every dead man's side I feel more and more that something, immaterial as the Being who willed the thing to live, has escaped me and my analysis. Life seems to me a thing as real, as positive, as death, and, trust me, St. Clair, as we live on and on, we get to have more and more trust in recognitions of truths indefensible by mere logic. To the man whom the latter despotically governs I have nothing to say in the way of blame."

"As I think of it," said St. Clair, "death, of which I have seen nothing, only excites my boundless curiosity; and as I observe that generally I am correct in my predictions about myself, and am by nature fearless, I suspect that I would feel more curiosity than dread if I knew that I were to die to-night. One fear I certainly should have. I should shudder to think that my curiosity might not be gratified. And you? Do you think it will be?"

"I do not know. We are on ground which I rarely tread in talk. Some men, and I am one, shrink from these discussions as they grow older. One says more or less than one means, and a word said is like a bullet sped. As to some things I like to be silent. One gets into the power of words."

"What are you saying?" I added. He was speaking under his breath. He at once repeated aloud what he had been murmuring.

Death seems so simple. Will it be
Only a new complexity?
Or shall the broken body free
Broad wings of clearer life for me?

The mood and its expressed thoughts were unusual in the joyous man beside me, and without more words we moved on to the gate of St. Ann's. I left St. Clair below-stairs, and went up alone to the consultation. Drs. L—— and S—— awaited my coming. The case was one of old injury to the head. The consultation was called so late in the case that the question of the value of an operation was doubtful. The character of the two men came out strongly, as it is apt to do in these grim councils. The one, L——, was clear, rapid,

seized on the main points with almost instinctive capacity, formulated the facts and reached his conclusions with confident decisiveness. The other, S——, an older man, listened, read and reread the notes, lifted into prominence for himself the minor symptoms, and ceaselessly combated the other doctor's conclusions, deciding finally against an operation as useless.

My own voice settled the question for operation on the ground of harmlessness to a man insensible to pain, and without it sure to die. The operation was done swiftly and well by L——. As it went on it became clear that it had failed because of being a week or more too late. Said S——, who had the case in charge: "I always knew it would fail; I am sorry I troubled you at all. I don't believe much in brain surgery."

The instruments were cleaned and removed, the dressings arranged, the man carried to his ward bed, and a screen drawn around it. Then a fair-haired nurse sat down by his side, and the man was left to his fate.

As L—— and I descended the stairs alone, he said to me, "If you or I had had that case a month ago, it would have been operated upon, and possibly saved. Certainly his chances would have been enormously better. That man S—— is like an indecisive little child playing at puss-in-the-corner. He tries this corner, and runs for that, and all are occupied by some logical difficulty. Is it a moral or an intellectual defect?"

I said: "It has probably cost a life, and must have cost many. It is not any mere lack of reasoning power. His essays are clear. You would think from them that he never had a doubt. There he has no responsibility. But let him face a case, and he begins to be troubled. He is a good man, and so tremendously anxious to be right, and to do right, that when human life and interests enter into his mental operations he becomes perplexed. At least that is the way I read him."

"How different from Y——, who does not care an atom for the patient, but is distracted by his fear of intellectual failure. Naturally he abhors the post-mortem criticism. I hate most of all the fellow who reaches an opinion somehow, is scared by his own decision, and begins to hedge."

I laughed,

"If ifs and ans
Were pots and pans,
How good a brain
Were any man's."

"Indecision is an awful fool. Good-night."

In the waiting-room I found St. Clair. "Are you still of the same mind?" said I. He nodded. "Then come." And we went up-stairs.

Stillness reigned in the dimly lighted ward, except for the soft tread of a night nurse, or the hoarse breathing of some sleeper lost to his own troubles, and regardless in slumber of the neighboring tragedy of death.

With St. Clair at my side I walked over to the bed, drew the screen aside, and went within its shelter. I could see that my friend was awed.

"He is worse," said the quiet little nurse in a low tone. "You can talk," I said to St. Clair, "only not so as to disturb these others. This man will never hear voice of earthly man."

"And he is dying!" He spoke in a tone of surprise.

"Yes, and rapidly."

"And has no pain?"

"No; none."

"And why don't you do something?"

"All has been done. We are face to face with the inevitable."

"He seems as if he was working," said St. Clair. "How flushed he is! How hard he breathes! And he sweats like one who toils, and has no other expression. It is like a watch with the mainspring broken, all a hurry of meaningless motion. And his hands, how they twitch! And this you call death. I told you that I had never seen it before, and yet it looks not unnatural. Have we some intuition of it? I must have seen it before."

The young nurse looked up at him with surprise.

"Ah!" he said, recoiling. The mockery of laughter which sometimes contorts the face of death, the *risus sardonius*, passed over the features.

"Come," I said; "you have had enough of this."

"No; I shall stay. May I stay?"

"Certainly. A seat, nurse. I will speak to the head nurse." And I left him.

(To be continued.)

S. Weir Mitchell.

ON A ROSE PRESSED IN A BOOK.

I WIN the summer back again
At touch of this dead rose.—
O lavish joy! O tender pain!
The very June wind blows,
And thrills me with the old refrain
Whose music my heart knows:
I win the summer back again,
At touch of this dead rose.

Ah, lost is all the summer's gain,
And lost my heart's repose;
And was it tears or was it rain
That wept the season's close?
The winter suns they coldly wane;
White fall the winter snows:
But Love and Summer come again
At touch of this dead rose.

Louise Chandler Moulton.

DID THE GREEKS PAINT THEIR SCULPTURES?

OF the many problems which are occupying the attention of archæologists, there is none of greater importance to the artists of the present day than that suggested in the above question; none the solution of which is likely to have so great an effect upon the art of the future. Up to the beginning of the Renaissance, from an indefinitely remote period, it had been the general custom to paint wooden and stone sculptures, excepting those used as exterior architectural decorations, in brilliant and often realistic colors. With the awakening of interest in classical art came the desire to imitate the ancients in their methods as well as in their principles; and the statues known at that time being—at least when they came into the hands of artists and amateurs—devoid of color, it was inferred that the Greek and Roman sculptors left the marble in its native whiteness. Consequently the artists of the Renaissance began this practice in their own works, and thus colored sculpture died out. We still find a leaning toward it in the works of the Della Robbias, and in the terra-cotta portraits of Donatello and his contemporaries, but the sentiment regarding the immaculate stone, the unwillingness to “paint the lily,” had its origin in their time, and has lasted ever since.

Now, supposing we were to find that the men of the Renaissance were mistaken in believing that their classical predecessors left their sculptures white; supposing it can be proved to-day that the Greeks did color their statues and their reliefs, and that the custom of the middle ages was one handed down by unbroken tradition from classic times, will our sculptors correct the

error made by their predecessors; or does the sentiment regarding the essential separation of form from color in sculpture now rest upon such firm ground of its own that we shall ignore the authority of the Greeks in this particular, and continue on our own way? This is a question which a wiser prophet than I must answer.

In the ateliers of sculptors, both in this country and in Europe, I have noticed what seemed to me indications of a desire to get away from the conventional white. The attempts to “tone” the marble with a wash that will give it an “antique” effect, the endeavor to suggest colors by pale, translucent tints, have the appearance of a sort of compromise between what the sculptor feels that his work needs to attain completeness, and what he thinks he ought to do, or to avoid doing, to conform with the traditions in which he has been educated. However, this part of the discussion is beyond my province, and is only indirectly connected with the object of this paper, which is to show what has been, not what will be done. I wish to treat the question with which we began as one of fact, not of sentiment. If we can arrive at a definite or satisfactory knowledge of what the Greeks did, we may be content to leave the consequences to others.

THE interest of the Renaissance in classical sculpture was purely artistic. The scientific spirit which now prompts the archæologist to make careful record of every detail connected with the excavation of a statue, to note every bit of evidence bearing upon its previous history, did not then exist. The sculptures of the ancients were prized solely as objects of beauty, and if they were not in beautiful condition when found, the restorer did not hesitate to make them so. Not only were they carefully

cleaned, and often polished, but missing limbs and features were freely supplied, according to the taste and fancy of the artist to whom the work fell. Sometimes, as in the case of the Laokoön, with an absolute disregard of the indications of the original gestures left upon the figures, pieces were neatly inserted where the surface had been bruised or battered, and, thus rejuvenated, statues and reliefs were offered to wealthy collectors.

Such being the case, there is small cause for wonder that the slight flakes and scraps of color which would have been the only traces that could have survived the burial of centuries were swept out of sight, and even their existence unsuspected. Yet, in a letter to which I shall have occasion to refer later, Professor Lanciani has called my attention to one circumstance which seems to me highly significant upon this point. He says:

As regards the question of the Renaissance, I beg to notice one thing: The last element of ancient polychromy to disappear is the gilding, especially the gilding of edges, borders, and fringes. Gilding resists obliteration more [than colors] because of the *mordente*. Now, was it not the fashion of the Renaissance artists to gild not only their figures but also their architecture? Take, for instance, the lovely *ciboria* of Donatello, and even of Sansovino, the altar-pieces in *basso*- and *alto-rilievo*. They are always gilded to a certain extent.

Whether this practice was due to a conscious imitation of the antique, or was, like their painted sculptures of which I have spoken, a residue from medieval customs, the belief that an essential quality of classical sculpture in marble was its whiteness was handed down from one generation to another, and almost without question, until the beginning of the present century. Winckelmann, to be sure,—who in his “History of Ancient Art,” published in 1764, laid the foundations of the modern science of archæology,—mentioned the fact that he had observed gilding in the hair and drapery of several marble statues, and that there were “heads, indeed, which were entirely gilt.”¹ He even went so far as to say, in speaking of the pseudo-archaic statue of Artemis (now in the Museum of Naples), which still retains numerous traces of color, that although he believed that figure to be Etruscan, yet “from a passage in Plato it might seem as if the same practice existed also among the Greeks”;² but, strangely enough, he left the subject there, without fur-

ther hint or inquiry, important as it was. The reason is simple. The materials available for investigation in his time were of the kind already described, with very rare exceptions like those mentioned by him; and from these it would have been impossible to attain any positive results.

Yet the scientific seed was sown, and from the time of Winckelmann excavations were watched more carefully. Greece herself was beginning to open her treasures to the student. The materials which both she and Italy yielded were examined in a new spirit, and the question of color was among the earliest to receive attention. The first special publication on the subject was a superb folio by the French archæologist M. Quatremère de Quincy, issued in 1815, of which the title alone well-nigh covers the entire field.³ His investigations were chiefly in regard to the famous *colossi* in gold and ivory, the masterpieces of Pheidias, Polykleitos, and the other sculptors of their period; but he also touched upon works in marble, and announced his belief that these were colored in all parts. He was quickly followed by others, architects especially, who began to systematize and enlarge upon the traces of paint found on architectural remains, with a view to restoring the original effect of classic buildings in color as well as in form. Semper was a strong advocate of the use of color in both architecture and sculpture, and, under the influence of men like him, the theory ran riot for a few years, so that we find one writer insisting that the Greeks not only covered their statues completely with color, but even went so far as to paint lights and shadows on them.⁴

These men went further than was warranted by the material then at hand, and their theories received a set-back in an essay by Franz Kugler, the well-known writer on the history of painting, which I may be pardoned for stopping to mention, as it remained until within a few years the most authoritative publication on the subject.⁵ Kugler belonged to the class to whom the essence of sculpture is form, and form alone; and realizing that his predecessors had gone further in the matter than they were justified by the facts, he tried to save as much of the white in Greek marble sculpture as he could. Remains of statues and reliefs which retained traces of color had accumulated to a considerable extent during the previous twenty years, and in the essay of which I speak he gave a list of all such pieces as were known to him,

et Romains, avec la restitution des principaux monuments de cet art et la démonstration pratique ou le renouvellement de ces procédés mécaniques. Par M. Quatremère de Quincy, membre de l'Institut.

¹ Book VII, chap. 2, § xii. of Lodge's translation.

² Ibid., Book VII, chap. 4, § xv.

³ “LE JUPITER OLYMPIEN”: ou l'art de la sculpture antique considéré sous un nouveau point de vue; ouvrage qui comprend un essai sur le goût de la sculpture polychrome, l'analyse explicative de la toreutique, et l'histoire de la statuaire en or et ivoire chez les Grecs

describing the remains upon them, with a view to deducing the whole truth from these. But his object was to admit the existence of color only where he found himself compelled to, and some of the arguments he used to justify his results are decidedly amusing. The iris of the eye, for example, he was obliged to admit was colored, and of this he says:

But the human eye, the focusing-point at which thoughts and feelings are concentrated and expressed, cannot be rendered by form; here Nature has drawn the limits of sculpture; and where she acts solely through color, there must the artist do likewise.

The results of his examination, as regards sculpture, were that the presence of color was established upon the hair, brows, lids, iris, and, in archaic works only, on the lips; also upon certain details of the draperies, such as borders, of which no indication is given in the sculpture itself. All other parts of the figure were white, though, as regards the flesh, he was obliged, in view of the statements of ancient writers, to grant a certain finish, or "toning," with wax, which did not, he thought, materially affect the color.

We need not pause now to criticize this theory, but if the reader will picture to himself the effect of a Greek statue with brown or reddish hair, gilded perhaps, eyebrows and lids to match, the iris of some dark color, and the lips, face, and skin of the natural pallor of marble, or the still more ghastly hue of wax, I think he will share my surprise that any such hideous combination could have been ascribed to the most keenly esthetic people that ever lived; and still more that such a doctrine should have held its own for some forty years, as this did. Such wretched compromises were the last throes of the school to which the term "classic" was synonymous with cold, severe, heartless—by which Greek art and Greek life alike were placed so high in the realm of the ideal as to be devoid of any sympathy with common humanity. Fortunately we have emerged from that epoch. The studies of men like Alma Tadema and Frank D. Millet, not to mention the investigations of archaeologists, have shown us that, in the matter of costume at least, the white-marble idea is an exploded one, that the Greeks were as thoroughly human as ourselves, and much fonder of color.

Since Kugler wrote, the discoveries bearing upon our question have multiplied amazingly, especially during the last fifteen years, and the amount of evidence brought to light is now really so large that we can hardly hope for more satisfactory data than we possess. This evidence has been examined by a number of archaeologists, especially in Germany, but the one who has made it his special province is

Professor Georg Treu of Dresden. Those who have visited within the last few years the fine collection of casts of which he is the director, and have seen there the very interesting results of his experiments in restoring the color of certain statues, must have felt that the subject is an important one, and likely to lead to a revolution of our conceptions of Greek sculpture. In 1884 Professor Treu published a pamphlet entitled "*Sollen wir unsere Statuen bemalen?*" (Ought we to paint our statues?) which made a profound impression on the artistic world; and the perusal of this led me to give the matter careful attention. Being in Europe at the time, I had excellent opportunities for investigation; and starting absolutely without bias or preconception, I made careful notes of every bit of evidence, *pro* and *con*, which I came upon during a trip through Greece and Italy, and also in the larger northern museums; as a result of which I became convinced of the following points:

(1) That from the beginning of their art of sculpture, through its whole course, it was the custom of the Greeks, and following them the Romans, to paint their marble statues and reliefs.

(2) That this application of color was not restricted to certain details, but covered the entire surface of the marble, both nude parts and draperies, with the possible exception of portions where the natural color of the marble served its purpose in the general scheme.

(3) That the colors used were not merely tints, but strong body-colors, the aim of the artist being to imitate nature in the matter of color just so far as the sculpture itself did in that of form; that is, with a conventional idealization or generalization by which the unpleasant features of realism were avoided.

The last statement perhaps requires a word of explanation. In saying that the Greeks colored the nude parts of their figures so as to imitate nature in this particular just so far as the sculpture did in the matter of form, I have in mind the fact familiar to all, that Greek sculpture in its greater epochs was never exactly real—that the sculptors always allowed themselves a certain reservation which resulted in a conventional idealization. The most obvious instance of this is the so-called Greek profile, the straight line running from the line of the hair to the tip of the nose. Precisely such a profile as this probably never existed, yet the broad, low forehead and the straight, short nose were characteristic of the Greek race then, as now, in the purer types of the people; and one of the most interesting proofs of the genius of the Greek sculptor was the skill with which he eliminated what we may call the accidental features of the face and figure, and produced

a generalized or composite type, which has been for all subsequent ages the standard of the ideal in art.

It is my belief that there was, in the same way, a conventional scheme of color applied to the nude; a color which was not precisely that of nature in any one individual, but which stood for it, avoiding minor and unessential details,—such as the difference of complexion between one man and another,—and thus escaping the charge of realism. Such a treatment did exist in their paintings, the best illustration of which is in the distinction between the male and female sex. The Egyptians made this distinction by painting the flesh of the former a deep dun-red, and the latter yellow. Whether the Greeks borrowed this scheme or originated it for themselves, we find them adopting a similar method from a very early period of their vase-painting; and in a tomb at Pæstum, the wall-paintings from which, now in the museum at Naples, belong to a period not later than the middle of the fifth century B. C., we find this shown in a most striking manner. The flesh of the women is very fair, almost white, with a pink flush on the cheeks, while that of the men is a warm brown-red—a much greater distinction than would naturally exist between the two sexes of the same race. Every scrap preserved to us of the paintings of Greece, Rome, and Etruria shows this same distinction, with more or less refinement, according to the epoch from which it dates. Perhaps the finest example is to be found on the “Amazon Sarcophagus” in the Archæological Museum at Florence, beautifully reproduced in color in the “Journal of Hellenic Studies” for 1883, plates 36, 37, 38. This monument has an especial value in the history of Greek polychromy, because it represents an art at least three centuries earlier than that of the paintings of Herculaneum and Pompeii.

HAVING stated my creed, it now remains for me to prove it. In endeavoring to do this I desire to say at the outset that I claim no originality for the reasons I shall give. The reader will find hardly a fact brought forward that has not been noted before, and if this contribution to the discussion possesses any merit, it is because the conclusions stated were arrived at by independent and unbiased examination both of the monuments themselves and of the arguments hitherto advanced in support of both sides.

Unfortunately there is no work of Greek sculpture now extant of which we can be certain that it has lost nothing of its original appearance. Within the last few years a large number of statues and reliefs have been brought to light with traces of color upon them, some

with more and some with less; but among all that we have there is not one at which we can point and say, “There, that is exactly what the Greeks did in regard to color, and it is all they did,” because, with every trace that we possess at present, there are also indisputable indications that there was originally something more, and it is the absence of that something which causes the difficulty. This being the case, the natural impulse would be to follow the rule adopted in the investigation of other branches of Greek art, and to look to ancient authors to fill up the gaps in the evidence given by the monuments. Here again we meet with discouragement at the start, because, through the whole course of classical literature which is preserved to us, there is no description of a painted statue—no direct statement that statues were painted. Now, this silence may be interpreted in one of two ways: It means either that they were not painted at all, or that the practice was so universal as not to require specific mention, any more than we should find it necessary to state that the water of the Atlantic is wet, or the coal from Pennsylvania is black. Were the sculptures not painted at all, the matter would end there, but were they painted universally, we should expect to find at least a hint of the fact in an occasional chance allusion, perhaps by way of simile or comparison. Of remarks of this nature we have a number which, though by no means large, is happily sufficient to establish the fact. I shall not attempt to give the complete list of them, as it would be out of place here,¹ but will select three or four of the most striking.

Vitruvius (Book VII, chap. 9), speaking of the application of vermilion to exposed parts of buildings, says:

And if any one should be more particular, and should wish the vermilion finish to retain its color, he must, when the wall is finished and dry, rub over it, with a stiff brush, Punic wax melted and tempered with a little oil; and afterward, with live coals in an iron vessel, heat the wall so thoroughly as to dissolve the wax and make it smooth; then rub it down with a candle and clean cloths, just as nude marble figures are treated (*uti signa marmorea nuda curantur*).

This extract, I admit, does not in itself establish the application of color to the marble, and might be held to refer simply to a method of giving it a finish. But it is a process foreign to modern sculpture; it has evidently nothing to do with form, and apparently was applied only to the nude parts. If not necessarily con-

¹ Those who care to pursue this part of the question further are referred to a pamphlet by Christian Walz, “Ueber die Polychromie der antiken Sculptur,” Tübingen, 1853, where all the important allusions are discussed from a philological point of view.

ARCHAISTIC STATUE OF ARTEMIS.

ENGRAVED BY C. A. POWELL.

nected with color, it must, even though we had no further evidence, be accepted as an indication of at least some kind of toning process. That it referred to something more than that I think we shall see presently.

Much more satisfactory is a passage in one of Plutarch's "Essays,"¹ in which he illustrates the relation of actors to the drama they perform by saying :

They are like the toilet-makers and chair-bearers of a luxurious woman ; or rather, like the encausters and gilders and colorers of statues (ἀγαλμάτων ἐγκαυσταὶ καὶ χρυσωταὶ καὶ βαφείς).

Here is certainly an interesting list of trades

¹ "De Glor. Athen.," chap. 6.

connected with the art of sculpture, the nature of which is beyond all doubt. Certainly no one of them would have been called upon to finish a statue that was to be left in the purity of the marble.

Again, Plato himself gives us a most valuable hint. In the "Republic" (Book IV, p. 420, C), Sokrates is insisting upon the relation which the parts of an object should bear to the whole, and uses this illustration :

If we were painting a statue [ἀνδριάντας γράφοντας], and some one were to come and blame us for not putting the most beautiful colors on the most beautiful parts of the body,—for the eyes, he would say, ought to be purple, but they are black,—in that case we might fairly answer, Sir, do not imagine that we ought to beautify the eyes to such a degree that they are no longer eyes ; but see whether, by giving this and the other features their due, we may make the whole beautiful. (Jowett's translation.)

But the most significant allusion which we have in any ancient writer is the oft-quoted passage in Pliny's "Natural History" (Book xxxv), in which he describes the Athenian painter Nikias, and, after showing how highly his works were valued, says (133) :

This is the Nikias of whom Praxiteles, when asked which of his marble works he es-

teemed most highly, said, "Those to which Nikias has put his hand," so much did he prize the *circumlitio* of that artist.

This word *circumlitio* has no satisfactory definition, nor can it have until we know more about the technical processes of the subject we are discussing. Literally it means a "smearing over," which suffices to show that it had no reference to the sculptor's side of his art. It was a painter's work of some kind ; and the fact that one of the foremost artists of his time in Athens—a man whom Brunn compares to Masaccio—should have been called upon to perform it, shows that it required more than the eye or skill of an ordinary artisan to attain the

best results. This statement of Pliny was a hard nut for Kugler to crack, but he attacked it bravely, and offered three possible solutions of the difficulty, of which the reader is free to take his choice: first, that there might have been two men of that name, whom Pliny confounded; second, that this might have been a process of wax-coating which Nikias practised while still a young man, and without fame as a painter; third, that the statement itself was a joke—*vielleicht war es nur ein Bon-mot*.

and to do this we must look elsewhere than to writers for assistance. We must turn now to the monuments themselves, and, gathering a bit here and a bit there, see if we can reconstruct the whole. It is not my intention to give a catalogue of the sculptures which retain traces of color upon them,—not even the hospitable pages of *THE CENTURY* would admit that,—but to select from each epoch just enough for our purpose.

Before doing this, however, let us remember

FROM PHOTOGRAPH MADE FROM CAST IN BOSTON MUSEUM OF FINE ARTS.

SCENE FROM THE "AMAZON SARCOPHAGUS." (ARCHÆOLOGICAL MUSEUM, FLORENCE.)

To be sure, the last suggestion has never been controverted, to my knowledge, but archæologists are agreed that there is no sufficient ground for splitting Nikias in two, and the theory of the wax-coating without color is the invention of those who, for sentimental reasons, are loath to give up the white. The simplest and most direct interpretation of the passage is that the *circumlitio* was some sort of a coloring process requiring the hand of an artist, and that it was because he was a skilled painter that Nikias's results merited the praise of Praxiteles.

Nevertheless, accepting our own interpretations of the passages quoted, we have not yet advanced the matter much beyond the point where Kugler left it. He might have admitted that Nikias painted the hair and details, drawing the color-line at those; but I am trying to maintain that the entire figure was painted,

the great length of time that has passed since these sculptures were made. We are discussing works which were created from 2000 to 2500 years ago, and, after that interval of time, are looking for satisfactory remains of that most perishable of all artistic mediums—paint. Moreover, time has been by no means the only destroyer of evidence. Some sculptures, for example, after standing for centuries in the open air, exposed to wind, rain, and the chemical effects of the atmosphere, have been overthrown by earthquakes, and then lain buried in the mud of overflowing rivers. Others have been buried in lime, than which there is no more destructive agent; and still others, which have been really protected by the soil in which they lay, have been unearthed with color still bright upon them and have lost it all in a few hours.¹ In view of these circum-

¹ See extract from Professor Lanciani's letter on p. 880.

stances, and of many others which might be cited, the cause for surprise is not that such slight traces have been preserved, but that there are any at all. Naturally the mineral pigments have been the best to withstand the various influences, and therefore the traces of red, blue, and gold are out of proportion to those of other colors.

Among the oldest of the dated Greek sculptures we possess are the three well-known metopes from Selinus, Sicily. This town was colonized by Greeks about 628 B. C., and there is sufficient reason for believing that the temple among the ruins of which these metopes were found was built in the years immediately following. When unearthed, in 1822-23, the metopes showed numerous traces of color, some of which they still retain, as follows:

(a) "Perseus slaying Medusa."—On the background traces of red; the female figure at the left, brownish black on brows, lids, and pupils, red on the borders of the garment, yellow on the garment itself; Perseus, green on the garment, red on the belt and cap, blue on the belt; Medusa, yellow on the face, red on the eyes. The eyes of the Perseus and the wings of the Pegasus also showed remains of color when discovered, the shade of which was no longer determinable.

(b) "Herakles carrying the Kerkopes" (the thieving gnomes who robbed him while asleep).—On the background, traces of red; on the Herakles, red on the right thigh, on the right arm directly under the shoulder, on the

sword, belt, and scabbard; the same color on the bands, shoulders, and upper arms of the Kerkopes.

(c) "The Four-horse Chariot."—Red was found upon the background, the pole, the axles, and the garment of the middle figure; upon the horses: indistinct traces of gray were found on the body of the second, and white on the third, and reddish brown on the harness.¹

These traces are merely slight patches or flakes of color scattered here and there but they show that, in the part of the Hellenic world to which they belonged, at the earliest period of Greek art, the ground of relief-work was colored; the flesh of males was painted red or reddish, while that of a female monster like the Gorgon was yellow,—a fact substantiated by terra-cottas from other places,—and that the various parts of the eye, and details in the drapery and other accessories, were indicated by colors.

Let us turn now to Athens itself, and see if the same practice obtained there. Our knowledge of the polychromy of early Attic sculpture has been infinitely broadened recently by the discovery on the Akropolis of statues and reliefs antedating the period of the Persian invasion. These were described and illustrated in an article by Mr. Russell Sturgis in "Harper's Magazine" for September, 1890, to which the reader may be referred. There is, however, one among these valuable relics, not

HEAD OF PERITHOOS.

(FROM WEST PEDIMENT OF TEMPLE OF ZEUS, OLYMPIA.)

illustrated by Mr. Sturgis, which I must mention in detail because its bearing upon our subject is of especial importance. This is the decoration, in high relief, of the pediment of a small building, the total length of the relief being about twenty feet. The very primitive style of the sculpture shows that it belongs to the epoch of the metopes from Selinus, probably the early part of the sixth century B. C., though obviously the work of a different school. The subject is the combat of Herakles with the hydra. At the left Iolaos holds a two-horse chariot in waiting, his face turned to watch the struggle. In the center Herakles, the figure much mutilated, advances with raised club and outstretched arm against the many-headed monster, whose huge coils occupy the right half of the pediment. The material is "poros," or Peiraieus stone. In 1885 I noted colors upon this as follows: The outer of the two horses was black, the color having turned now to a dark green; the other a reddish brown. The charioteer has black hair and beard. His flesh is colored in all parts, the color being now a strong rose. The original color of his garment is not determinable; it is now a brownish gray. The reins and

other parts of the harness, and the body of the chariot, are reddish brown. The color of the wheel is gone. The legs and a bit of the arm of the Herakles show the same color as the charioteer. The hydra was of various colors, black, green, and red being now distinguishable. The background shows no trace of color.

It has been argued that the colors on this pediment are so well preserved as to enable us to assert that where no traces of color are left, as on the background, it was never applied; but this is an unwise assumption, since, among these very sculptures from the excavations on the Akropolis are several examples which should warn us against accepting such a theory. For instance, there is the marble head of a boy, of a more advanced style of art, the face of which is still a strong reddish tint, the lips a deeper shade of the same, while the hair shows no sign of color. Are we to suppose this to be the artist's intention? So, of the female figures illustrated by Mr. Sturgis—through all of which it is fair to presume that the same general system of coloring prevailed, since they are of the same school and period—we find some whose lips show absolutely no trace of color, while those of others are still, or were when I saw them, bright red.

The statues found on the Akropolis give all the proof needed of the completeness and variety of shade with which garments were colored; they show not merely that the inner garment was distinguished from the outer in this way, but that borders, patterns, decorations, of which the sculpture itself gives no hint, were liberally supplied by the artists mentioned by Plutarch in the passage quoted above. Of the painting of the skin itself I noted one very surprising example—an archaic head of Athena, of life-size, the material being white marble. When I saw it, in 1885, it was in a flat case in Room V of the Akropolis museum. The remains of the helmet were of the dark bluish green that indicates gilding, on which a honeysuckle pattern was traced with a sharp tool. In the hair were slight remains of red; the brows, lashes, outline of iris, and pupil were black; the iris itself brown. On the face were numerous and unmistakable traces of a white coating—a fact

HERAKLES AND THE HYDRA. (ARCHAIC PEDIMENT RELIEF IN ATHENS.)

Print, from "Ephemeris Archaeologike," issued by the Archaeological Society at Athens.

which I verified in several visits to the museum. This was extraordinary, because the marble itself was so white, though whether the coating still retained its original color, I could not determine. On the lips there were no remains of color.

Passing to the transitional epoch, we find evidences of color sufficient to show that the practice was continued, though there are no

in the British Museum were carried to England by Lord Elgin, they were subjected to a careful chemical investigation by a commission of which Sir Michael Faraday was the head. The commission was unable to detect the slightest trace of anything that indicated the presence of artificial color on the surface of the marble. Of positive evidence, therefore, we have none. At the same time, the frieze of the Parthenon

MARBLE HEAD OF ATHENA PARTHENOS. (IN BERLIN MUSEUM.)

ENGRAVED BY CHARLES STATE.

Print, from "Antike Denkmäler" des Deutschen Archäolog. Instituts. I, Plate 3.

such striking examples as those we have examined. On the sculptures from the temple of Zeus at Olympia significant traces were found. There was red upon the mantle of the great Apollo of the western pediment. On the metope representing Herakles and the Cretan bull the head of Herakles still showed the brown-red when it was excavated, and the bull a similar color, the ground of the relief being blue. Many of the figures from this and other works of about the same time present the curious phenomenon of perfectly smooth hair, in which not a line is traced, it having been left thus intentionally by the sculptor, to be finished by the painter.

We come now to the most interesting monument of Greek sculpture. Was the frieze of the Parthenon painted? There is not a trace of color on it to-day. When the portions of it now

offers some of the most convincing illustrations of the Greek practice of coloring sculpture that we possess. First of all, its situation is an argument. I think that everybody who has had the opportunity to appreciate its exact position upon the building has felt that much of the labor spent upon its execution was in vain. It was about forty feet above the floor of the colonnade. The colonnade itself measures only fifteen feet in width; and seen at this angle, the crowded groups on the long walls would be nothing but a confusion of legs and heads were we to judge from its present colorless condition. But assuming that the horses were picked out in different colors, as was done in the archaic reliefs described above; that the garments of the riders, and the other accessories, were distinguished in the same way, the modeling would then give the design an effect

PHOTOGRAPH MADE FROM CAST IN BOSTON MUSEUM OF FINE ARTS.
YOUTH TYING HIS SANDAL.
(FROM WESTERN FRIEZE OF THE PARTHENON.)

which it never could have had if painted on a flat surface, and the color would supply to the relief the means of a ready distinction of details from whatever distance it was seen, whereas many are now indistinguishable, even at a few yards. I had the pleasure of seeing the experiment tried on a cast from a slab of the western frieze by the German sculptor Carl Cauer. He covered the slab entirely with colors, in a naturalistic scheme, and though the result was at first sight rather startling to modern taste, it was certainly very convincing on this point. The slab was exhibited at a considerable height, yet the details showed with astonishing clearness.

However, this is only begging the question.

Of some kind of combination of color we have absolute proof in the metal accessories that were affixed to the marble. The bridles and reins of all the horses were of metal, probably gilded bronze, to judge from analogous cases, and the holes for attaching them are still plainly visible on the heads of the horses and on the hands of the riders. They are never indicated in the carving. Of metal also, and secured in the same way, were many of the objects carried by individuals, as well as other details. Here we have, then, a combination of at least two colors, which, if carried no further, must have had an effect not less tawdry than that of the crowned and bejeweled marble figures in Italian churches. Left to themselves upon a pure-white marble surface, these gilt details would neutralize all the refinement exhibited in the modeling. Combined with other colors, they would have occupied their proper place in relation to the whole. Moreover, while there are, as I have said, no remains of color on the frieze, there are many details in it which must have been represented by this medium, if at all. The sculpture itself gives no suggestion of them, and there are no holes to show that they were affixed. So numerous are the cases of this omission that one is embarrassed in the choice of a block which will best illustrate them. That on page 879 will answer well enough. Two of the three figures have their hands raised as if grasping some object like a staff; but where is the object itself? The marble is as smooth as when finished, and shows absolutely nothing. Again, of the sandals of these and all other figures in the frieze only the soles are indicated in the relief; the straps are omitted entirely. A striking case of this is the young soldier of the western frieze who has stopped to tie his sandal, with his foot raised upon a large stone. Although the action of the hands is unmistakable, they are quite empty. Neither in them nor about the ankle is there any sign of a strap. Among the cattle led to sacrifice are some struggling finely with their leaders. The men pull, the beasts pull, but they pull nothing. There are no indications of straps or cords either in the hands of the one or about the heads of the other. Examples of this kind might be multiplied indefinitely, but space is precious.

It is the painting of the nude upon the frieze of the Parthenon which we cannot prove, and this we can establish only inferentially if we can show that it was done both before and after the time to which that building belongs. We have seen that it was done before, and fortunately we have just one monument of the first quality to show that the practice still existed in the fourth century B. C. This is the mausoleum at Halikarnassos, the work of four of the greatest Athenian sculptors of their time, Skopas him-

self being one of them. During excavations on this site, in 1857, Sir Charles Newton discovered a number of blocks of the frieze on which color was still brilliant; and of this he says:¹

It has been already noted that the whole frieze was colored. From the examination of a number of fragments on their first disinterment, I ascertained that the ground of the relief, like that of the architectural ornaments, was a blue, equal in intensity to ultramarine, *the flesh a dun-red*, and the drapery and armor picked out with vermilion and perhaps other colors. The bridles, as on the

Of the last period of Greek sculpture—that known as the Hellenistic—I shall cite only two examples, one the Great Altar of Pergamon, upon the sculptures of which, now in the Berlin museum, no remains of color have been found, so far as I am aware. This is by no means strange, and proves nothing as regards the original condition, in view of the manner in which many of the blocks had been utilized for building walls in the later barbaric ages, and also of the presence of lime-kilns in the neighborhood. But upon the draperies of the figures are

SLAB REPRESENTING POSEIDON, HELIOS, AND A FEMALE. (FROM EASTERN FRIEZE OF THE PARTHENON.)

frieze of the Parthenon, were of metal, for the attachment of which the heads of several of the horses are pierced.

Vivid as these colors were when the frieze was discovered, they had so nearly disappeared by the time the marbles reached England that Newton was obliged to secure the written statements of those who had seen them in order to prove their existence. The unequivocal testimony of a monument of such importance, executed under the influence of pure Attic art, needs no commentary.

¹ "Travels and Discoveries in the Levant," Vol. II, p. 131.

² Of course the most convincing examples of the coloring of Greek sculpture, in the Hellenistic or any other epoch, are the beautiful sarcophagi discovered a few years since at Sidon, and now in Constantinople.

shallow grooves or lines, chiseled in the marble, which, in my opinion, can be nothing else than indications of the edges of stripes and borders that were represented in color. The explanation of them as representing folds or wrinkles in the garments is absurd, because they are not in the places of, nor do they follow the lines natural to, folds or wrinkles. The other work is a Bacchic relief in the museum of Naples, pictured on page 881, on which the traces of color are so numerous and satisfactory as to deserve detailed description.²

Not having seen these or any colored reproduction of them, I am unable to describe them except from hearsay; but they will soon be published in a manner worthy of their importance by MM. Théodore Reinach and Bey-Hamdi.

GODDESS HURLING VASE. (FROM THE RELIEF OF THE GREAT ALTAR AT PERGAMON.)

First figure: The hair shows traces of red; on the flesh are a number of specks, especially in the folds, which are undoubtedly remains of paint; the same on the drapery, but in both cases the color itself is indeterminable; on the sides of the tympanum are reddish traces, and on the top are traces of a star-like pattern, surrounded by a wreath.

Second figure: Traces of a yellowish color in hair and tail; on the flesh and the panther-skin are numerous specks similar to those on the first figure.

Third figure: There is red in the hair; remains of paint in the ear and about the eye; the panther-skin shows very decided traces of yellow, and the spots were painted on it in a color which is now a greenish gray; the left foot still shows strongly the red-brown color. On the background are remains which show that it was not painted simply a flat color, but decorated, as there are traces of green or blue near the first figure, of yellow near the third figure, and of

a star pattern, three stars of which remain, to the left of the figures.

As to Roman art, I shall let him speak who is best qualified to do so, and quote the following from a letter of Professor Lanciani:

The points upon which you kindly ask my opinion are:

(1) The universality of the practice of coloring marble statues in Greece and Rome.

Speaking, of course, of Rome alone, I divide the 350 statues, or important fragments of statues, discovered under my direction into two classes. The first comprises the statues found in free ground and embedded in earth (45 per cent. of the total number); the second comprises the statues found in the thickness of Decadence walls, and consequently embedded in lime (55 per cent. of the total number). These last are out of the question, as the lime has eaten up the surface of the marble, and made investigation impossible. Of the statues found in good condition, in pure earth, and at a considerable depth, *one half* showed traces of colors at the very moment they

were brought to light. Of this half, two thirds lost their polychromy at once, one third still preserve it. Among the best specimens of polychrome sculpture dug up under my care, or within my recollection, I may mention the "Faustina" of the Monte della Giustizia (Capitol), the recumbent Venus at Ostia; the "Boys Playing 'Osselets'" of the Campo Verano (Palazzo dei Conservatori), a sarcophagus recently found out-

reddish; the two Tritons were gilt; the Venus Lamiana had never been painted; the two Muses — uncertain.

(2) Whether this system of coloring aimed at imitating nature.

Yes; I think it did. We have, in the Palazzo dei Conservatori, a large head of Mythras (or Atys) with the Phrygian cap painted in red, eyelashes carefully painted in black, lips in pink,

ENGRAVED BY M. HAIDER.

BACCHUS PRECEDED BY A FAUN AND A BACCHANTE. (FROM HERCULANEUM, IN NATIONAL MUSEUM, NAPLES.)

side the Porta S. Lorenzo, etc., etc. The Mythraic and Methraic sculptures are *always painted*, and so is every bit of terra-cotta. I have never seen architectural marble fragments with traces of coloring,¹ except, of course, Trajan's Column, which is said to show them. Gilding is even more frequent than painting. The "Tritons" of the Palazzo dei Conservatori, the sarcophagus of Vicovaro (see Bull. Com.), the Medea sarcophagus in the Tandolo collection, are or were gilt. The traces of coloring are, in 80 per cent. of the cases, to be seen in draperies alone; the flesh is very seldom painted. Blue, red, purple, and gold are the prominent colors.

On Christmas Eve, 1874, the Archæological Commission found seven statues in an empty room (*Horti Lamiani*). They had never had any contact with earth. Of the seven statues and busts, the colossal head of Commodus had never been painted; the head of Diana had the hair

¹ In Athens, however, such fragments are very common.

and so on. In the sarcophagus found at Porta S. Lorenzo each piece of clothing of the various figures is carefully painted in imitation of the real stuff. The female *tunica* and *pepla* are in monochrome, save the border, or fringe, which is either gilt or polychrome.

(3) The extent to which flesh-tints were represented.

I do not think I recollect more than two or three instances of this flesh-coloring (save the Mythraic bas-reliefs and figures).

Professor Lanciani's opinion regarding the head of Commodus and the Venus found with it, as well as some observations of my own, lead me to think it probable that at a late period, possibly during the empire, exceptions were made to the universal custom of painting sculptures. The materials for a satisfactory investigation of this point, however, we do not at present possess. One of the most satisfactory examples

AUGUSTUS CÆSAR. (IN MUSEUM OF THE VATICAN.)

of the polychromy of Roman sculpture is the famous statue of Augustus Cæsar in the Vatican, which was discovered at Prima Porta in 1863. The following description of the colors upon it is translated from Otto Jahn's "Aus der Alterthumswissenschaft," published in 1868 (p. 260). It must be remembered, however, that the colors here described are those which always last the longest, and it is by no means to be supposed that they were the only ones originally applied:

The tunic of Augustus is *crimson*, the mantle *purple*, the fringe of the armor *yellow*; on the

nude portions of the body no traces of color are noticeable, except the indication of the pupils with a *yellowish* tint; and the hair no longer shows color. But the relief decorations of the cuirass are painted with especial care, although the flat surfaces are left without color. The god of heaven, rising from *blue* waves or clouds, holds a *purplish* garment in both hands; the chariot of the sun-god is *crimson*; before him soars a female with outspread *blue* wings; the goddess of the earth wears a wreath of wheat in her *blonde* hair. Apollo in a *crimson* mantle rides upon a griffon with *blue* wings; the *light-haired* Diana, in a *crimson* garment, is borne by a *red-dish brown* stag. In the middle stands a Roman

Commander in *blue and red armor, crimson tunic, and purple mantle*, with a *blue helmet*. A bearded warrior in *crimson tunic and blue trousers* holds up a Roman standard with insignia painted *blue*. The barbarian on the right, with *auburn hair*, in a *purple mantle*, holds a war-trumpet; the figure on the left is likewise *light-haired*, and clothed in a *blue mantle*.

So much for the testimony of sculpture itself. And now, if I have not taxed the reader's patience too far, I should like to add just one bit of evidence from another source, which strengthens the argument where the testimony of sculpture is weakest; namely, in regard to flesh-painting, especially in female figures.

While in Naples, a few years since, I made careful studies of the wall-paintings and mosaics from Herculaneum and Pompeii, to discover what bearing they might have upon the matter. It was my intention to continue the investigation at Pompeii itself, but illness prevented, so I was obliged to content myself with conclusions reached in the museum. Among the paintings there I found eighty-one representations of sculpture (including five about which I was doubtful). Of these, fourteen, from their yellowish or greenish tinge, apparently represented bronze. On seven I could not be certain that there was any color but white. On one the flesh was white, but the hair, eyes, and border at the neck of the garment were dark brown. The remaining fifty-nine were colored so completely and realistically that often it was only by the fact that they stood on pedestals or in niches that they could be distinguished from the living figures. Through all of them distinction between males and females in the color of the flesh was that which has been described above; the male figures being a warm, ruddy brown, the fe-

males pink and white. Beings of an effeminate nature, like the "Hermaphrodite" and "Young Dionysos," have the male color. The only exception to the rule which I noted was in the statue of an Amazon, whose flesh was of a shade between the two. In this she differs from the Amazons on the Amazon sarcophagus, who are decidedly fair. Even the "Karyatids," and those other architectural sculptures which are introduced so frequently in the bizarre type of Pompeian decoration, are colored as naturally as the living figures in the same pictures—hair, flesh, drapery, and accessories. Among the mosaics is one representing the statue of a boxer, of a good type. He stands upon a pedestal of bluish marble-color, behind which runs a red railing. The background is deep blue. Upon his hands he wears the *cæstus*. The materials used for representing the figure are white (on the high lights), pink, red-brown, light brown, dark brown, and pale blue—the last three being used in the shadows. In other words, this statue is of the same colors as the living male figures in the other mosaics collected here. This ought to be even more convincing than the paintings, since mosaic-colors are the least likely of all to be affected by the various influences to which antiquities have been exposed. Yet, if the reader is still skeptical, I will refer him to one of

the pictures from Pompeii in which a woman is represented in the very act of painting a piece of sculpture! Her subject is a *herma*, a quadrilateral pillar surmounted by the upper part of a figure; and it represents an old, bearded Dionysos, who holds a drinking-cup in one hand and a *thyrsos* in the other. His hair is dark brown, beard gray, flesh a dark tone, and mantle yellow. With this evidence I am content to rest the case.

WOMAN PAINTING A HERMA. (WALL-PAINTING FROM POMPEII, IN NATIONAL MUSEUM, NAPLES.)

GIPSIES IN CHURCH.

THE FEAST OF THE MARYS.

(PLAY IN PROVENCE.)

WITH PICTURES BY THE AUTHOR.

TEN years ago I made up my mind to go to Oberammergau. But when 1890 came nobody asked me. Instead, in the middle of May, I was in Arles, and on the 23d on my way to Saintes-Maries for the feast Mistral sings in "*Mirèio*."

The road to the town crosses for thirty miles the Camargue, no longer a fearful desert, but one of the richest parts of France, a land that in the autumn reeks of wine. On this May morning there passed down the broad white highway an endless succession of long carts, each filled with sad and silent peasants or bright and jolly Arlésiens, who were singing hymns as they went. Many of the people looked tired and sick and worn; in some wagons I saw blind men and cripples and helpless paralytics.

As I jogged slowly on I overtook wandering monks, gypsies, the Archbishop of Aix, and more and more cart-loads of pilgrims. Finally, as the cultivation ceased, and the wide salt-marshes began, the town, with the battle-mented walls of its church, came into sight, faintly outlined low down against the sea, and I looked at it as *Mirèio* did on her weary journey:

She sees it loom at last in distance dim,
She sees it grow on the horizon's rim,
The saints' white tower, across the billowy plain,
Like vessel homeward bound upon the main.

Tourists who go to Saintes-Maries always describe it as a wretched, miserable collection of little hovels. It is, on the contrary, a flourishing fishing village, with two very decent hotels, a *mairie*, and all the other belongings of a small French country town. The hotels usually charge about four francs a day. But on the 23d, 24th, and 25th of May the landlords get a hundred francs for a room from any one who has not brought his own tent or carriage, or has not a friend, and objects to sleeping in the open.

When I wandered into the church I found that it had been completely transformed since I had last seen it. Galleries were erected around the interior, the side altars were boarded up, and the best places on the choir steps were covered with the cushions and pillows of the faithful, who in this manner reserve their seats for the three days' feast. A lay brother was busy drawing water from the holy well, salt all the year, but fresh during the *fête*, while a number of pilgrims were either drinking it or bottling it up and carrying it away. Every now and then a marvelously picturesque gypsy would mount from the lowest chapel, for at Saintes-Maries

Altars and chapels three,
Built one upon the other, you may see,

and he would scratch some powder from the rock on which the Marys landed, and descend again to where

Beneath the ground
The dusky gipsies kneel, with awe profound,
Before Saint Sarah.

From their subterranean shrine came the strangest singing:

*Dans un bateau sans cordage,
Au naufrage
On vous exposa soudain;
Mais de Dieu la providence,
En Provence,
Vous fit trouver un chemin.*

Then, "Vivent les Saintes Maries!" they shouted, and their shouts echoed through the long, low, barrel-vaulted church, almost a tunnel, and were repeated by the crowds kneeling about the choir. As strange as their singing were the black-shrouded figures of the Romany *chals*, gathered together from no one knew where, and now, on their knees, grouped around the tomb of their saint. Many and evil, one felt, must have been the deeds which required all this devotion to be washed away.

Throughout the afternoon people kept pouring into the town. Every foot of space around the church was filled with booths, from the stand for the sale of votive offerings managed by a priest to an equally flourishing gambling establishment presided over by a charming young lady. The gipsy women who were not engaged in praying sat by the door holding shells for alms, just as many a wandering brother in the same place may have begged his way

THE CHURCH AT NIGHT.

hundreds of years before. At the main door a small blind girl was stationed, and for the next three days the air rang with her ceaseless cry: "*Messieurs-et-Mesdames-n'oubliez-pas-la-pauvre-petite-aveugle-et-les-Saintes-Maries-ne-vous-oublieront-pas.*" To the saints themselves she never turned for the miracle for which so many were hoping, and once in a while it seemed to occur to the sacristan that hers was not the best example to encourage the belief of the faithful, and he would come and take her away. But he could never stop the endless flow of her petition, and before it had quite died away in the distance she would make her escape and find her way back again. She might have been the devil's own advocate.

The curé of the town was hustling about, looking after the Archbishop, greeting all the arriving clergy, and selling tickets for the good places in the church during the next two days. But though nearly worked to death, he was still smiling and amiable.

By evening the town was completely encompassed by a great camp of gipsies and peasants and farmers. The sun sank into the marshes, great camp-fires were lighted, and then the mosquito was abroad in the land.

I looked into the church again after dark. It was crowded; on the raised choir, where the high altar usually stands and where the

THE CHURCH DOOR.

relics were to descend on the morrow, lay the sick, votive candles casting a dim light upon their sad, thin faces, which stared out, white and ghastly, from the surrounding shadows.

And, ah, what cries they lift ! what vows they pay !

Those who could were chanting hymns in quavering voices, their friends taking up the chorus. Many lay still and silent. One boy seemed too feeble to do more than to move a trembling, emaciated hand in time to the singing, and yet, every now and then, he would open wide his heavy eyes, and into his death-like face would come a look of longing, and in a shrill voice that rose high above all the others he would shriek, "Vivent les Saintes Maries!" It was as though the grave opened and the dead spoke. All night these weary watchers would lie there, waiting and hoping, and all the next day until the descent of the holy relics, the touch of which must surely heal them.

While the faith in the saints was so strong around the shrine, the faith in Boulanger seemed equally great out in the open night ; at least his march was sung as loud and as long as the hymns to the Marys — louder and longer, in fact, for it kept me awake for hours. And so is all life divided between pain and pleasure.

On the morning of the 24th, the great day, there were masses and sermons and practising of the choir within the church ; there were bargaining and gambling and preaching without. In the blinding sunlight a steady stream of people kept winding down the single highroad into the town, while far off, at the mouth of the Little

"VIVENT LES SAINTES MARIES!"

Rhone, steamers from Marseilles and Arles and Saint-Gilles unloaded their pilgrims, who, like *Mirèio*, came wandering across the salt-marshes.

By three o'clock the church was nearly full ; by four it was jammed. Around each door outside was a great crowd ; inside there was not an empty seat. The long ray of light which streamed in through the broken rose-window at the western end was momentarily shut out by the people who had climbed even away up there. Every one in nave and gallery held a lighted candle, which twinkled and flickered and waved with the great volume of the singing. "We are in heaven, and the stars are under our feet," Gounod said when, one 24th of May, he looked down upon the same scene. In the raised choir the sick still waited, their friends and a few priests still prayed and chanted. "The church was like a wind-swept wood" with the mighty voice of their supplication.

Suddenly there was a cry of "They come !" The people around the altar fell on their knees ; for from the airy chapel, high above the choir, a great double ark hung suspended, and now began to move downward, though almost imperceptibly. As it came slowly nearer the sick and infirm were raised toward it in the arms of the strong. Women fairly wrestled together, each seeking to be the first to lay her hand upon the holy relics. When it was a few feet from its resting-place, a solemn procession of white-robed clergy passed from the sacristy to the choir, and one priest, springing upon the altar,

OUTSIDE THE CHURCH.

seized and kissed the relics. At the same moment he was surrounded by the sick, who, as though the longed-for miracle had already been worked, pushed and struggled to touch and be healed. The priest held the relics, and the people, pressing closer and closer, fell upon them, touching them with their hands, their eyes, and even their crippled limbs, kissing them passionately, clasping them with frenzy. It seemed as though the priest's vestments must be torn to shreds, the relics broken and scattered in a thousand fragments, from the very fervor of the faithful. But finally the last kiss was given, the last petition uttered, the ark was set at rest upon the altar, the sick were placed all around it, and the chants rose louder and sweeter than ever — "Vivent les Saintes Maries!"

Was any one cured? No; not yet could the blind see, the deaf hear, the lame arise and go their way. But there was not a single sick man or woman whose hope was not strong for another year. There is no faith like this in Protestantism.

Again all night the sick lay there, and the church was filled with ceaseless singing. Hymn followed hymn, the pious gipsies in the lower chapel singing one verse, the people in the church above responding with the next. And again all night an army of pilgrims was camped around the town.

On the 25th, while the morning was still young, a long procession started from the church, headed by the different banners given by the towns of Provence. In solemn state the Archbishop of Aix, attended by clergy and acolytes, marched through the narrow streets, half in shadow, out into the open sunlight to the sea-shore. And next the sick and crippled came, some borne on mattresses, some hobbling

PREACHING OUTSIDE THE CHURCH.

on crutches, and others dragged along by their friends. Last of all a struggling crowd of gipsies carried aloft the rude figures of the two Marys in their little boat, and on every side devout pilgrims strove to kiss, or at least to touch, the holy bark. Across the sands to the sea they went, to the water's edge, and then right into the water, gipsies, people, and even priests. For a moment the boat was set afloat upon the waves, there where at the dawn of Christianity the wind had driven the saints from Jerusalem. And the gipsies again raised it aloft, and waded to land; the procession, with banners waving, candles flickering dimly in the sunshine, hymns loudly chanted, turned again across the sands, through the shadowy streets, and brought back their beloved Marys to the church. The sick were placed once more about the altar, and shouts of "Vivent les Saintes Maries!" echoed through the church until, toward evening, the ark rose slowly to its airy chapel, while the faithful watched it with loving eyes.

THE PROCESSION.

IN THE WATER.

But it had hardly reached its shrine when the church was empty. In ten minutes every one had mounted cart, or diligence, or omnibus, and was leaving for home. In two hours not a trace was to be seen of gipsy or Gentile. The pilgrims had fled as though from the plague, or had entered for a race to Arles.

So ended the feast of the Marys.

For the people of the town there was a grand ball, a grand arrival of the bulls, and a grand bull-fight. But they were much less grand and characteristic than in Arles.

This, one of the last unexploited religious festivals of the world, will have lost its character and simplicity before the article is printed. For my friend the engineer is at work on a railway.

Joseph Pennell.

THE STORY OF THE TWO MARYS.

If a lizard, wolf, or horrid snake
Ever should wound thee with its fang, betake
Thyself forthwith to the most holy saints,
Who cure all ills and hearken all complaints.

THE saints that Mistral sings of in his "Mirèio" are Mary Jacobe and Mary Salome, whose feast in May, in the little village which bears their name, is the greatest festival of Provence, and whose legend has been told again and again by Provençal poet and chronicler. They were two of

the large company of holy men and women from Palestine who were thrown by the Jews into a boat without sails or oars or food, and then set adrift upon the sea. But, so tell they the tale, an angel of the Lord was sent to them as pilot, and the two Marys and Sarah, their servant, holding their long robes like sails to the wind, came swiftly and safely to the shores of the land which it was their mission to convert to Christ. They disembarked upon the remote edge of the wide and desolate Camargue, built an altar, and Maximin, one of their number, offered up the sacrifice of the mass, and

THE RETURN FROM THE SEA.

where the water had been as salt as the sea it now suddenly rose at their feet sweet and pure from a miraculous spring, a sign of the divine approval.

Then they separated, each to go his or her own holy way, all save the two Marys, who with Sarah stayed, and, building a cell near the altar, lived there the rest of their days. Sometimes fishermen passed by that lonely coast, and to them the saintly women preached the true faith, and won them to Christ. Sometimes from Arles Trophimus came and administered the sacraments to his sisters in the Church. And the fame of the holiness of the three women went abroad, and when, after they died, they were buried where they had lived, people journeyed from far and near to visit and pray at the tomb, and many miracles were worked, so that their renown grew ever greater and greater. Before many years it had become a well-known place of pilgrimage,—one of the most ancient in France,—and a mighty church was built over their lowly altar, and many and strange were the wonders wrought. A little town grew up about the church, and nuns and monks erected their convents and monasteries near, and as Rocamadour was honored in the far west of Languedoc, so was the shrine of the Saintes Maries beloved in Provence.

Then evil days followed. Saracens and Danes laid waste the land, and if even Arles and Marseilles fell before their attacks, how could the remote village in the desert withstand them? And there were also pirates, who infested Camarguan shores. And between them all, by the tenth century, nothing was left of Saintes-Maries except the little altar guarded by a hermit. But it fell out that one day William I., Count of Provence, hunting in the Camargue, chanced upon the old forgotten shrine, and the hermit told him of its glory in the past; and the Count's heart was touched, and he promised to restore it to its greatness. And the church which he built was strong, and fortified with battlements and a tower,—you can still see it on the sands to-day,—and pirates were defied, and peace once more reigned in the sacred spot. Then again pilgrims thronged to it from every part of France. Houses and monasteries again rose beneath the shadow of the church. Miracles were worked, and its prosperity returned, as

William had promised. Four centuries later good King René found beneath the church the bones of the three blessed women,—by the sweet smell they gave forth they were known to be the remains of the two Marys and Sarah,—and inclosed them in a richly adorned casket, which was placed in the little airy chapel above the choir. It was then decreed that once every year, in May, they should be lowered into the church, and shown to the faithful. The relics of Saint Sarah were set in the crypt, where they received special honor from the gipsies, to whose race she had belonged. As the centuries passed the fame of the shrine increased, and there was no better-loved place of pilgrimage throughout the land.

And then again began evil days. From the Reign of Terror the village by the sea could not escape. The church was sacked, its shrine desecrated, and had not the curé concealed the sacred relics, they too must have perished when their casket was burned. After the Revolution, when quiet was restored, a new casket was made, the bones were again carried to their chapel, and the annual pilgrimage began with all the old fervor.

Saintes-Maries is so out of the way, so difficult to reach, that in this railroad age it may be said to have lost its old popularity, that is, outside of the *Midi*. A twenty-five miles' drive across the broad plain of the Camargue, and the absolute certainty of having to sleep out of doors, seem no light matters to the pilgrim who can step from a railway-carriage into a big hotel at Lourdes. As a consequence Saintes-Maries, which has no other interest save that which the shrine gives it, receives but scanty mention in the guide-book, and to the average tourist is practically unknown. But throughout the south of France the devotion to the two Marys has never weakened. The people still flock to the May feast by hundreds and thousands. And because of the sincerity of the pilgrims, and the absence of curious lookers-on, the festival has retained a character of which few religious ceremonies nowadays can boast. However, a railroad is being built across the Camargue, and in a few years Saintes-Maries will have lost its character and become as fashionable as Lourdes.

THE NAULAHKA.¹

A STORY OF WEST AND EAST.

BY RUDYARD KIPLING AND WOLCOTT BALESTIER.

XIV.

CITY of tents had grown up in three days without the walls of Rhatore—a city greened with far-brought lawns of turf, and stuck about with hastily transplanted orange-trees, wooden lamp-posts painted

in gaudy colors, and a cast-iron fountain of hideous design. Many guests were expected at Rhatore to grace the marriage of the Maharaj Kunwar—barons, princes, thakurs, lords of waste fortresses and of hopeless crags of the North and the South, fiefs from the fat, poppy-blazoned plains of Mewar, and brother rajahs of the King. They came accompanied by their escorts, horse and foot.

In a land where genealogies, to be respectable, must run back without a break for eight hundred years, it is a delicate matter not to offend; and all were desperately jealous of the place and precedence of their neighbors in the camp. Lest the task should be too easy, the household bards of the princes came with them, and squabbled with the court officials of Gokral Seetarun. Behind the tents stretched long lines of horse-pickets, where the fat pink-and-blue-spotted stallions neighed and squealed at one another, under their heavy velvet trappings, all day long; and the ragged militia of twenty tiny native states smoked and gambled among their saddles, or quarreled at the daily distribution of food furnished by the generosity of the Maharajah. From hundreds of miles about, vagrant and mendicant priests of every denomination had flocked into the city, and their salmon-colored raiment, black blankets, or ash-smear'd nudity gave Tarvin many minutes of untrammelled entertainment as he watched them roaming fearlessly from tent to tent, their red eyes rolling in their heads, alternately threatening or fawning for gifts. The rest-house, as Tarvin discovered, was crammed with fresh contingents of commercial travelers. His Highness was not likely to pay at such a season, but fresh orders would be plentiful. The city itself was brilliant with coats of pink-and-white lime-wash, and the main streets were obstructed with

the bamboo scaffoldings of fireworks. Every house-front was swept and newly luted with clean mud, and the doorways were hung with marigolds and strings of jasmine-buds. Through the crowds tramped the sweating sweetmeat-dealers, venders of hawks, dealers in cheap jewelry and glass bracelets and little English mirrors, while camels, loaded with wedding gifts of far-off kings, plowed through the crowd, or the mace-bearers of the state cleared a path with their silver staves for the passage of the Maharajah's carriages. Forty barouches were in use, and, as long as horse-flesh held out, or harness could be patched with string, it did not beseem the dignity of the state to provide less than four horses to each. As these horses were untrained, and as the little native boys, out of sheer lightness of heart, touched off squibs and crackers at high noon, the streets were animated.

The hill on which the palace stood seemed to smoke like a volcano, for the little dignitaries came without cessation, each expecting the salute of cannon due to his rank. Between the roars of the ordnance, strains of uncouth music would break from the red walls, and presently some officer of the court would ride out of one of the gates, followed by all his retinue, each man gorgeous as a cock-pheasant in spring, his mustache fresh oiled, and curled fiercely over his ears; or one of the royal elephants, swathed in red velvet and bullion from shoulder to ankle, would roll out under the weight of his silver howdah, and trumpet till the streets were cleared for his passage. Seventy elephants were fed daily by the King—no mean charge, since each beast consumed as much green fodder daily as he could carry on his back, as well as thirty or forty pounds of flour. Now and again one of the monsters, maddened by the noise and confusion, and by the presence of strange rivals, would be overtaken with paroxysms of blind fury. Then he would be hastily stripped of his trappings, bound with ropes and iron chains, hustled out of the city between two of his fellows, and tied down half a mile away by the banks of the Amet, to scream and rage till the horses in the neighboring camps broke their pickets and stampeded wildly among the tents. Pertab

Singh, commandant of his Highness's body-guard, was in his glory. Every hour of the day gave him excuse for charging with his troop on mysterious but important errands between the palace and the tents of the princes. The formal interchange of visits alone occupied two days. Each prince with his escort would solemnly drive to the palace, and half an hour later the silver state barouche and the Maharajah himself, jeweled from head to heel, would return the visit, while the guns gave word of the event to the city of houses and to the city of tents.

When night fell on the camp there was no silence till near the dawn, for strolling players, singers of songs, and tellers of stories, dancing-girls, brawny Oudh wrestlers, and camp-followers beyond counting, wandered from tent to tent making merry. When these had departed, the temples in the city sent forth the hoarse cries of conchs, and Kate, listening, seemed to hear in every blast the wail of the little Maharaj Kunwar, who was being prepared for his marriage by interminable prayers and purifications. She saw as little of the boy as Tarvin did of the King. In those days every request for an audience was met with, "He is with his priests." Tarvin cursed all the priests of Rhatore, and condemned to every variety of perdition the hangdog fakirs that prowled about his path.

"I wish to goodness they'd come to a point with this fool business," he said to himself. "I have n't got a century to spend in Rhatore."

After nearly a week of uninterrupted clamor, blazing sunshine, and moving crowds clad in garments the colors of which made Tarvin's eyes ache, there arrived, by the same road that had borne Kate to the city, two carriages containing five Englishmen and three Englishwomen, who, later, walked about the city with lack-luster eyes, bored by the official duty which compelled them to witness in the hot weather a crime which it was not only beyond them to hinder, but to which they were obliged to lend their official patronage.

The agent to the Governor-General—that is to say, the official representative of the Viceroy in Rajputana—had some time before represented to the Maharajah that he might range himself in the way of progress and enlightenment by ordering that his son should not be given in marriage for another ten years. The Maharajah, pleading the immemorial custom of his land and the influence of the priests, gilded his refusal by a generous donation to a women's hospital in Calcutta which was not in want of funds.

For his own part, Tarvin could not comprehend how any government could lend its countenance to this wicked farce, calling itself a

marriage, which was presently to be played out with the assistance of two children. He was presently introduced to the agent of the Governor-General, who was anxious to learn more about the damming of the Amet. To be asked about the damming of the Amet, when he was making no more progress than at present with the Naulahka, seemed to Tarvin, however, the last touch of insult, and he was not communicative, asking the agent, instead, a number of urgent questions about the approaching infamy at the palace. The agent declaring the marriage to be a political necessity, the destination suggested by Tarvin for political necessities of this sort caused the official to stiffen, and to look this wild American up and down with startled curiosity. They parted on poor terms.

With the rest of the party Tarvin was more at ease. The agent's wife, a tall brunette, belonging to one of those families which from the earliest days of the East India Company have administered the fortunes of India, solemnly inspected Kate's work at the hospital; and being only a woman, and not an official, was attracted, and showed that she was attracted, by the sad-eyed little woman who did not talk about her work. Therefore Tarvin devoted himself to the amusement and entertainment of the agent's wife, and she pronounced him an extraordinary person. "But, then, all Americans are extraordinary, you know, though they're so clever."

Not forgetting in the midst of this tumultuous pageant that he was a citizen of Topaz, Tarvin told her about that blessed city of the plain, away off there under the Sauguache Range, where half his heart lay. He called it "the magic city," implying that the dwellers of the western continent had agreed to call it so by general consent. She was not bored; she enjoyed it. Talk of land and improvement companies, boards of trade, town lots, and the Three C.'s was fresh to her, and it became easy to lead up to what Tarvin actually had in mind. What about the Naulahka? Had she ever seen it? He asked these questions boldly.

No; she knew nothing of the Naulahka. Her thoughts were bounded by the thought of going home in the spring. Home for her meant a little house near Surbiton, close to the Crystal Palace, where her three-year-old boy was waiting for her; and the interests of the other English men and women seemed equally remote from Rajputana—not to mention the Naulahka. It was only inferentially that Tarvin could gather that they had spent the greater part of their working lives within the limits of the country. They talked as gipsies might talk by the roadside a little before the horses are put into the caravan. The ways were hot, they implied, and very dusty; and they hoped one

day to be able to rest. The wedding was only one more weary incident on the line of march, and they devoutly wished it over. One of them even envied Tarvin for coming to the state with his fresh eye and his lively belief in the possibility of getting something out of the land beside a harvest of regrets.

The last day of the marriage ceremonies began and ended with more cannon, more fireworks, more clattering of hoofs, more trumpeting of elephants, and with the clamor of bands trying to play "God Save the Queen." The Maharaj Kunwar was to appear in the evening (in an Indian state wedding the bride is neither mentioned nor seen) at a banquet, where the agent of the Governor-General would propose his health and that of his father. The Maharaj was to make a speech in his best English. A court scribe had already composed a long oration to be used by his father. Tarvin was beginning seriously to doubt whether he should ever see the child alive again, and, before the banquet, rode out into the seething city to reconnoiter. It was twilight, and the torches were flaring between the houses. Wild outlanders from the desert, who had never seen a white man before, caught his horse by the bridle, examined him curiously, and with a grunt let him pass. The many-colored turbans showed under the flickering light like the jewels of a broken necklace, and all the white housetops were crowded with the veiled figures of women. In half an hour the Maharaj Kunwar would make his way from the royal temple to the banqueting-tent at the head of a procession of caparisoned elephants.

Tarvin forced his way inch by inch through the dense crowd that waited at the foot of the temple steps. He merely wished to satisfy himself that the child was well; he wanted to see him come from the temple. As he looked about him he saw that he was the only white man in the crowd, and pitied his jaded acquaintances, who could find no pleasure in the wild scene under his eyes.

The temple doors were closed, and the torch-light flashed back from the ivory and silver with which they were inlaid. Somewhere out of sight stood the elephants, for Tarvin could hear their deep breathing and an occasional squeal above the hum of the crowd. Half a troop of cavalry, very worn and dusty with the day's labors, were trying to clear an open space before the temple, but they might as well have tried to divide a rainbow. From the roofs of the houses the women were throwing flowers, sweetmeats, and colored rice into the crowd, while small bards, not yet attached to the house of any prince, chanted aloud in praise of the Maharajah, the Maharaj Kunwar, the Viceroy, the agent of the Governor-General, Colonel

Nolan, and any one else who might possibly reward praise with pence. One of these men, recognizing Tarvin, struck up a chant in his honor. He had come, said the song, from a far country to dam an ungovernable river, and fill the country-side with gold; his step was like the step of a dromedary in the spring; his eye terrible as that of an elephant; and the graces of his person such that the hearts of all the women of Rhatore turned to water when he rode upon the public way. Lastly, he would reward the singer of this poor song with untold generosity, and his name and fame should endure in the land so long as the flag of Gokral Seetarun had five colors, or as long as the Naulahka adorned the throat of kings.

Then, with an ear-splitting shriek of conchs, the temple doors opened inward, and the voices of the crowd were hushed into a whisper of awe. Tarvin's hands tightened on the reins of his horse, and he leaned forward to stare. The opened doors of the temples framed a square of utter darkness, and to the screeching of the conchs was added a throbbing of innumerable drums. A breath of incense, strong enough to make him cough, drifted across the crowd, which were absolutely silent now.

The next moment the Maharaj Kunwar, alone and unattended, came out of the darkness, and stood in the torchlight with his hands on the hilt of his sword. The face beneath the turban, draped with loops of diamonds under an emerald aigret, was absolutely colorless. There were purple circles about his eyes, and his mouth was half open; but the pity Tarvin felt for the child's weariness was silenced by a sudden thrill and leap of his heart, for on the gold cloth of the Maharaj Kunwar's breast lay the Naulahka.

There was no need, this time, to ask any questions. It was not he who saw it; its great deep eyes seemed to fall on him. It blazed with the dull red of the ruby, the angry green of the emerald, the cold blue of the sapphire, and the white, hot glory of the diamond. But dulling all these glories was the superb radiance of one gem that lay above the great carved emerald on the central clasp. It was the black diamond—black as the pitch of the infernal lake, and lighted from below with the fires of hell.

The thing lay on the boy's shoulders, a yoke of flame. It outshone the silent Indian stars above, turned the tossing torches to smears of dull yellow, and sucked the glitter from the cloth of gold on which it lay.

There was no time to think, to estimate, to appraise, scarcely a moment even to realize, for the conchs suddenly wailed again, the Maharaj stepped back into the darkness, and the doors of the temple were shut.

XV.

TARVIN made his way to the banquet with his face aflame and his tongue dry between his teeth. He had seen it. It existed. It was not a myth. And he would have it; he would take it back with him. Mrs. Mutrie should hang it about the sculptured neck that looked so well when she laughed; and the Three C.'s should come to Topaz. He would be the savior of his town; the boys at home would take the horses out of his carriage and drag him up Pennsylvania Avenue with their own hands; and town lots would sell next year in Topaz by the running inch.

It was worth all the waiting, worth the damming of a hundred rivers, worth a century of pachisi-playing, and a thousand miles of bullock-cart. As he drained a glass to the health of the young Maharaj Kunwar at the banquet that evening, he renewed his pledge to himself to fight it out on this line if it took all summer. His pride of success had lain low of late, and taken many hurts; but now that he had seen his prize he esteemed it already within his grasp, as he had argued at Topaz that Kate must be his because he loved her.

Next morning he woke with a confused notion that he stood on the threshold of great deeds; and then, in his bath, he wondered whence he had plucked the certainty and exultation of the night before. He had, indeed, seen the Naulahka, but the temple doors had closed on the vision. He found himself asking whether either temple or necklace had been real, and in the midst of his wonder and excitement was half-way to the city before he knew that he had left the rest-house. When he came to himself, however, he knew well whither he was going and what he was going for. If he had seen the Naulahka, he meant to keep it in sight. It had disappeared into the temple. To the temple, therefore, he would go.

Fragments of burnt-out torches lay on the temple steps among trampled flowers and spilt oil, and the marigold garlands hung limp and wilted on the fat shoulders of the black stone bulls that guarded the inner court. Tarvin took off his white pith helmet (it was very hot, though it was only two hours after dawn), pushed back the scanty hair from his high forehead, and surveyed the remnants of yesterday's feast. The city was still asleep after its holiday. The doors of the building were wide open, and he ascended the steps and walked in, with none to hinder.

The formless, four-faced god Iswara, standing in the center of the temple, was smeared and discolored with stains of melted butter, and the black smoke of exhausted incense. Tarvin looked at the figure curiously, half expecting

to find the Naulahka hung about one of its four necks. Behind him, in the deeper gloom of the temple, stood other divinities, many-handed and many-headed, tossing their arms aloft, protruding their tongues, and grinning at one another. The remains of many sacrifices lay about them, and in the half light Tarvin could see that the knees of one were dark with dried blood. Overhead the dark roof ran up into a Hindu dome, and there was a soft rustle and scratching of nesting bats.

Tarvin, with his hat on the back of his head and his hands in his pockets, gazed at the image, looking about him and whistling softly. He had been a month in India, but he had not yet penetrated to the interior of a temple. Standing there, he recognized with fresh force how entirely the life, habits, and traditions of this strange people alienated them from all that seemed good and right to him; and he was vaguely angered to know that it was the servants of these horrors who possessed a necklace which had power to change the destiny of a Christian and civilized town like Topaz.

He knew that he would be expelled without ceremony for profanation, if discovered, and made haste to finish his investigations, with a half-formed belief that the slovenliness of the race might have caused them to leave the Naulahka about somewhere, as a woman might leave her jewels on her dressing-table after a late return from a ball the night before. He peered about and under the gods, one by one, while the bats squeaked above him. Then he returned to the central image of Iswara, and in his former attitude regarded the idol.

It occurred to him that, though he was on level ground, most of his weight was resting on his toes, and he stepped back to recover his balance. The slab of sandstone he had just quitted rolled over slowly as a porpoise rolls in the still sea, revealing for an instant a black chasm below. Then it shouldered up into its place again without a sound, and Tarvin wiped the cold sweat from his forehead. If he had found the Naulahka at that instant he would have smashed it in pure rage. He went out into the sunlight once more, devoting the country where such things were possible to its own gods; he could think of nothing worse.

A priest, sprung from an unguessable retreat, came out of the temple immediately afterward, and smiled upon him.

Tarvin, willing to renew his hold on the wholesome world in which there were homes and women, betook himself to the missionary's cottage, where he invited himself to breakfast. Mr. and Mrs. Estes had kept themselves strictly aloof from the marriage ceremony, but they could enjoy Tarvin's account of it, delivered from the Topaz point of view. Kate was un-

feignedly glad to see him. She was full of the discreditable desertion of Dhunpat Rai and the hospital staff from their posts. They had all gone to watch the wedding festivities, and for three days had not appeared at the hospital. The entire work of the place had devolved on herself and the wild woman of the desert who was watching her husband's cure. Kate was very tired, and her heart was troubled with misgivings for the welfare of the little Prince, which she communicated to Tarvin when he drew her out upon the veranda after breakfast.

"I'm sure he wants absolute rest now," she said, almost tearfully. "He came to me at the end of the dinner last night—I was then in the women's wing of the palace—and cried for half an hour. Poor little baby! It's cruel."

"Oh, well, he'll be resting to-day. Don't worry."

"No; to-day they take his bride back to her own people again, and he has to drive out with the procession, or something—in this sun, too. It's very wicked. Does n't it ever make your head ache, Nick? I sometimes think of you sitting out on that dam of yours, and wonder how you can bear it."

"I can bear a good deal for you, little girl," returned Tarvin, looking down into her eyes.

"Why, how is that for me, Nick?"

"You'll see if you live long enough," he assured her; but he was not anxious to discuss his dam, and returned to the safer subject of the Maharaj Kunwar.

Next day and the day after he rode aimlessly about in the neighborhood of the temple, not caring to trust himself within its walls again, but determined to keep his eye upon the first and last spot where he had seen the Naulahka. There was no chance at present of getting speech with the only living person, save the King, whom he definitely knew had touched the treasure. It was maddening to await the reappearance of the Maharaj Kunwar in his barouche, but he summoned what patience he could. He hoped much from him; but meanwhile he often looked in at the hospital to see how Kate fared. The traitor Dhunpat Rai and his helpers had returned; but the hospital was crowded with cases from the furthest portions of the state—fractures caused by the King's reckless barouches, and one or two cases, new in Kate's experience, of men drugged, under the guise of friendship, for the sake of the money they carried with them, and left helpless in the public ways.

Tarvin, as he cast his shrewd eye about the perfectly kept men's ward, humbly owned to himself that, after all, she was doing better work in Rhatore than he. She at least did not run a

hospital to cover up deeper and darker designs, and she had the inestimable advantage over him of having her goal in sight. It was not snatched from her after one maddening glimpse; it was not the charge of a mysterious priesthood, or of an impalpable state; it was not hidden in treacherous temples, nor hung round the necks of vanishing infants.

One morning, before the hour at which he usually set out for the dam, Kate sent a note over to him at the rest-house asking him to call at the hospital as soon as possible. For one rapturous moment he dreamed of impossible things. But, smiling bitterly at his readiness to hope, he lighted a cigar, and obeyed the order.

Kate met him on the steps, and led him into the dispensary.

She laid an eager hand on his arm. "Do you know anything about the symptoms of hemp-poisoning?" she asked him.

He caught her by both hands quickly, and stared wildly into her face. "Why? Why? Has any one been daring—?"

She laughed nervously. "No, no. It is n't me. It's him."

"Who?"

"The Maharaj—the child. I'm certain of it now." She went on to tell him how, that morning, the barouche, the escort, and a pompous native had hurried up to the missionary's door bearing the almost lifeless form of the Maharaj Kunwar; how she had at first attributed the attack, whatever it might be, to exhaustion consequent upon the wedding festivities; how the little one had roused from his stupor, blue-lipped and hollow-eyed, and had fallen from one convulsion into another, until she had begun to despair; and how, at the last, he had dropped into a deep sleep of exhaustion, when she had left him in the care of Mrs. Estes. She added that Mrs. Estes had believed that the young prince was suffering from a return of his usual malady; she had seen him in paroxysms of this kind twice before Kate came.

"Now look at this," said Kate, taking down the chart of her hospital cases, on which were recorded the symptoms and progress of two cases of hemp-poisoning that had come to her within the past week.

"These men," she said, "had been given sweetmeats by a gang of traveling gipsies, and all their money was taken from them before they woke up. Read for yourself."

Tarvin read, biting his lips. At the end he looked up at her sharply.

"Yes," he said, with an emphatic nod of his head—"yes. Sitabhai?"

"Who else would dare?" answered Kate, passionately.

"I know. I know. But how to stop her going on! how to bring it home to her!"

"Tell the Maharajah," responded Kate, decidedly.

Tarvin took her hand. "Good! I'll try it. But there's no shadow of proof, you know."

"No matter. Remember the boy. Try. I must go back to him now."

The two returned to the house of the missionary together, saying very little on the way. Tarvin's indignation that Kate should be mixed up in this miserable business almost turned to anger at Kate herself, as he rode beside her; but his wrath was extinguished at sight of the Maharaj Kunwar. The child lay on a bed in an inner room at the missionary's, almost too weak to turn his head. As Kate and Tarvin entered, Mrs. Estes rose from giving him his medicine, said a word to Kate by way of report, and returned to her own work. The child was clothed only in a soft muslin coat; but his sword and jeweled belt lay across his feet.

"Salaam, Tarvin Sahib," he murmured. "I am very sorry that I was ill."

Tarvin bent over him tenderly. "Don't try to talk, little one."

"Nay; I am well now," was the answer. "Soon we will go riding together."

"Were you very sick, little man?"

"I cannot tell. It is all dark to me. I was in the palace laughing with some of the dance-girls. Then I fell. And after that I remember no more till I came here."

He gulped down the cooling draught that Kate gave him, and resettled himself on the pillows, while one wax-yellow hand played with the hilt of his sword. Kate was kneeling by his side, one arm under the pillow supporting his head; and it seemed to Tarvin that he had never before done justice to the beauty latent in her good, plain, strong features. The trim little figure took softer outlines, the firm mouth quivered, the eyes were filled with a light that Tarvin had never seen before.

"Come to the other side—so," said the child, beckoning Tarvin in the native fashion, by folding all his tiny fingers into his palms rapidly and repeatedly. Tarvin knelt obediently on the other side of the couch. "Now I am a king, and this is my court."

Kate laughed musically in her delight at seeing the boy recovering strength. Tarvin slid his arm under the pillow, found Kate's hand there, and held it.

The portière at the door of the room dropped softly. Mrs. Estes had stolen in for a moment, and imagined that she saw enough to cause her to steal out again. She had been thinking a great deal since the days when Tarvin first introduced himself.

The child's eyes began to grow dull and heavy, and Kate would have withdrawn her arm to give him another draught.

"Nay; stay so," he said imperiously; and relapsing into the vernacular, muttered thickly: "Those who serve the king shall not lack their reward. They shall have villages free of tax—three, five villages; Sujain, Amet, and Gungra. Let it be entered as a free gift when they marry. They shall marry, and be about me always—Miss Kate and Tarvin Sahib."

Tarvin did not understand why Kate's hand was withdrawn swiftly. He did not know the vernacular as she did.

"He is getting delirious again," said Kate, under her breath. "Poor, poor little one!"

Tarvin ground his teeth, and cursed Sitabhai between them. Kate was wiping the damp forehead, and trying to still the head as it was thrown restlessly from side to side. Tarvin held the child's hands, which closed fiercely on his own, as the boy was racked and convulsed by the last effects of the hemp.

For some minutes he fought and writhed, calling upon the names of many gods, striving to reach his sword, and ordering imaginary regiments to hang those white dogs to the beams of the palace gate, and to smoke them to death.

Then the crisis passed, and he began to talk to himself and to call for his mother.

The vision of a little grave dug in the open plain sloping to the river, where they had laid out the Topaz cemetery, rose before Tarvin's memory. They were lowering Heckler's first baby into it, in its pine coffin; and Kate, standing by the grave-side, was writing the child's name on the finger's length of smoothed pine which was to be its only headstone.

"Nay, nay, nay!" wailed the Maharaj Kunwar. "I am speaking the truth; and oh, I was so tired at that pagal dance in the temple, and I only crossed the courtyard. . . . It was a new girl from Lucknow; she sang the song of 'The Green Pulse of Mundore.' . . . Yes; but only some almond curd. I was hungry, too. A little white almond curd, mother. Why should I not eat when I feel inclined? Am I a sweeper's son, or a prince? Pick me up! pick me up! It is very hot inside my head. . . . Louder. I do not understand. Will they take me over to Kate? She will make all well. What was the message?" The child began to wring his hands despairingly. "The message! the message! I have forgotten the message. No one in the state speaks English as I speak English. But I have forgotten the message."

"Tiger, tiger, burning bright
In the forests of the night,
What immortal hand or eye
Framed thy fearful symmetry?"

Yes, mother; till she cries. I am to say the whole of it till she cries. I will not forget. I did not forget the first message. By the great god Har! I have forgotten this message." And he began to cry.

Kate, who had watched so long by bedsides of pain, was calm and strong; she soothed the child, speaking to him in a low, quieting voice, administering a sedative draught, doing the right thing, as Tarvin saw, surely and steadily, undisturbed. It was he who was shaken by the agony that he could not alleviate.

The Maharaj Kunwar drew a long, sobbing breath, and contracted his eyebrows.

"*Mahadeo ki jai!*" he shouted. "It has come back. 'A gipsy has done this. A gipsy has done this.' And I was to say it until she cried."

Kate half rose, with an awful look at Tarvin. He returned it, and, nodding, strode from the room, dashing the tears from his eyes.

XVI.

"WANT to see the Maharajah."

"He cannot be seen."

"I shall wait until he comes."

"He will not be seen all day."

"Then I shall wait all day."

Tarvin settled himself comfortably in his saddle, and drew up in the center of the courtyard, where he was wont to confer with the Maharajah.

The pigeons were asleep in the sunlight, and the little fountain was talking to itself, as a pigeon cooes before settling to its nest. The white marble flagging glared like hot iron, and waves of heat flooded him from the green-shaded walls. The guardian of the gate tucked himself up in his sheet again and slept. And with him slept, as it seemed, the whole world in a welter of silence as intense as the heat. Tarvin's horse champed his bit, and the echoes of the ringing iron tinkled from side to side of the courtyard. The man himself whipped a silk handkerchief round his neck as some slight protection against the peeling sunbeams, and, scorning the shade of the archway, waited in the open that the Maharajah might see there was an urgency in his visit.

In a few minutes there crept out of the stillness a sound like the far-off rustle of wind across a wheat-field on a still autumn day. It came from behind the green shutters, and with its coming Tarvin mechanically straightened himself in the saddle. It grew, died down again, and at last remained fixed in a continuous murmur for which the ear strained uneasily—such a murmur as heralds the advance of a loud racing tide in a nightmare, when the dreamer cannot flee nor declare his terror in any voice

but a whisper. After the rustle came the smell of jasmine and musk that Tarvin knew well.

The palace wing had wakened from its afternoon siesta, and was looking at him with a hundred eyes. He felt the glances that he could not see, and they filled him with wrath as he sat immovable, while the horse swished at the flies. Somebody behind the shutters yawned a polite little yawn. Tarvin chose to regard it as an insult, and resolved to stay where he was till he or the horse dropped. The shadow of the afternoon sun crept across the courtyard inch by inch, and wrapped him at last in stifling shade.

There was a muffled hum—quite distinct from the rustle—of voices within the palace. A little ivory-inlaid door opened, and the Maharajah rolled into the courtyard. He was in the ugliest muslin undress, and his little saffron-colored Rajput turban was set awry on his head, so that the emerald plume tilted drunkenly. His eyes were red with opium, and he walked as a bear walks when he is overtaken by the dawn in the poppy-field, where he has gorged his fill through the night-watches.

Tarvin's face darkened at the sight, and the Maharajah, catching the look, bade his attendants stand back out of earshot.

"Have you been waiting long, Tarvin Sahib?" he asked huskily, with an air of great good will. "You know I see no man at this afternoon hour, and—and they did not bring me the news."

"I can wait," said Tarvin, composedly.

The King seated himself in the broken Windsor chair, which was splitting in the heat, and eyed Tarvin suspiciously.

"Have they given you enough convicts from the jails? Why are you not on the dam, then, instead of breaking my rest? By God! is a king to have no peace because of you and such as you?"

Tarvin let this outburst go by without comment.

"I have come to you about the Maharaj Kunwar," he said quietly.

"What of him?" said the Maharajah, quickly. "I—I—have not seen him for some days."

"Why?" asked Tarvin, bluntly.

"Affairs of state and urgent political necessity," murmured the King, evading Tarvin's wrathful eyes. "Why should I be troubled by these things, when I know that no harm has come to the boy?"

"No harm!"

"How could harm arrive?" The voice dropped into an almost conciliatory whine. "You yourself, Tarvin Sahib, promised to be his true friend. That was on the day you rode so well, and stood so well against my body-

guard. Never have I seen such riding, and *therefore* why should I be troubled? Let us drink."

He beckoned to his attendants. One of them came forward with a long silver tumbler concealed beneath his flowing garments, and poured into it an allowance of liqueur brandy that made Tarvin, used to potent drinks, open his eyes. The second man produced a bottle of champagne, opened it with a skill born of long practice, and filled up the tumbler with the creaming wine.

The Maharajah drank deep, and wiped the foam from his beard, saying apologetically: "Such things are not for political agents to see; but you, Sahib, are true friend of the state. Therefore I let you see. Shall they mix you one like this?"

"Thanks. I did n't come here to drink. I came to tell you that the Maharaj has been very ill."

"I was told there was a little fever," said the King, leaning back in his chair. "But he is with Miss Sheriff, and she will make all well. Just a little fever, Tarvin Sahib. Drink with me."

"A little hell! Can you understand what I am saying? The little chap has been half poisoned."

"Then it was the English medicines," said the Maharajah, with a bland smile. "Once they made me very sick, and I went back to the native hakims. You are always making funny talks, Tarvin Sahib."

With a mighty effort Tarvin choked down his rage, and tapped his foot with his riding-whip, speaking very clearly and distinctly: "I have n't come here to make funny talk to-day. The little chap is with Miss Sheriff now. He was driven over there; and somebody in the palace has been trying to poison him with hemp."

"Bhang!" said the Maharajah, stupidly.

"I don't know what you call the mess, but he has been poisoned. But for Miss Sheriff he would have died—your first son would have died. He has been poisoned,—do you hear, Maharajah Sahib?—and by some one in the palace."

"He has eaten something bad, and it has made him sick," said the King, surlily. "Little boys eat anything. By God! no man would dare to lay a finger on my son."

"What would you do to prevent it?"

The Maharajah half rose to his feet, and his red eyes filled with fury. "I would tie him to the fore foot of my biggest elephant, and kill him through an afternoon!" Then he relapsed, foaming, into the vernacular, and poured out a list of the hideous tortures that were within his will but not in his power to inflict. "I would

do all these things to any man who touched him," he concluded.

Tarvin smiled incredulously.

"I know what you think," stormed the King, maddened by the liquor and the opium. "You think that because there is an English government I can make trials only by law, and all that nonsense. Stuff! What do I care for the law that is in books? Will the walls of my palace tell anything that I do?"

"They won't. If they did, they might let you know that it is a woman inside the palace who is at the bottom of this."

The Maharajah's face turned gray under its brown. Then he burst forth anew, almost huskily: "Am I a king or a potter that I must have the affairs of my zenana dragged into the sunlight by any white dog that chooses to howl at me? Go out, or the guard will drive you out like a jackal."

"That 's all right," said Tarvin, calmly. "But what has it to do with the Prince, Maharajah Sahib? Come over to Mr. Estes's, and I'll show you. You've had some experience of drugs, I suppose. You can decide for yourself. The boy has been poisoned."

"It was an accursed day for my state when I first allowed the missionaries to come, and a worse day when I did not drive you out."

"Not in the least. I'm here to look after the Maharaj Kunwar, and I'm going to do it. You prefer leaving him to be killed by your women."

"Tarvin Sahib, do you know what you say?"

"Should n't be saying it if I did n't. I have all the proof in my hands."

"But when there is a poisoning there are no proofs of any kind, least of all when a woman poisons! One does justice on suspicion, and by the English law it is a most illiberal policy to kill on suspicion. Tarvin Sahib, the English have taken away from me everything that a Rajput desires, and I and the others are rolling in idleness like horses that never go to exercise. But at least I am master *there!*"

He waved a hand toward the green shutters, and spoke in a lower key, dropping back into his chair, and closing his eyes.

Tarvin looked at him despairingly.

"No one man would dare—no man would dare," murmured the Maharajah, more faintly. "And as for the other thing that you spoke of, it is not in your power. By God! I am a Rajput and a king. I do not talk of the life behind the curtain."

Then Tarvin took his courage in both hands and spoke.

"I don't want you to talk," he said; "I merely want to warn you against Sitabhai. She 's poisoning the Prince."

The Maharajah shuddered. That a Euro-

pean should mention the name of his queen was in itself sufficient insult, and one beyond all his experience. But that a European should cry aloud in the open courtyard a charge such as Tarvin had just made surpassed imagination. The Maharajah had just come from Sitabhai, who had lulled him to rest with songs and endearments sacred to him alone; and here was this lean outlander assailing her with vile charges. But for the drugs he would, in the extremity of his rage, have fallen upon Tarvin, who was saying, "I can prove it quite enough to satisfy Colonel Nolan."

The Maharajah stared at Tarvin with shiny eyes, and Tarvin thought for a moment that he was going to fall in a fit; but it was the drink and the opium reasserting their power upon him. He mumbled angrily. The head fell forward, the words ceased, and he sat in his chair breathing heavily, as senseless as a log.

Tarvin gathered up his reins, and watched the sodden monarch for a long time in silence, as the rustle behind the shutters rose and fell. Then he turned to go, and rode out through the arch, thinking.

Something sprang out of the darkness where the guard slept, and where the King's fighting apes were tethered; and the horse reared as a gray ape, its chain broken at the waistband, flung itself on the pommel of the saddle, chattering. Tarvin felt and smelt the beast. It thrust one paw into the horse's mane, and with the other encircled his own throat. Instinctively he reached back, and before the teeth under the grimy blue gums had time to close he had fired twice, pressing the muzzle of the pistol into the hide. The creature rolled off to the ground, moaning like a human being, and the smoke of the two shots drifted back through the hollow of the arch and dissolved in the open courtyard.

XVII.

IN summer the nights of the desert are hotter than the days, for when the sun goes down earth, masonry, and marble give forth their stored heat, and the low clouds, promising rain and never bringing it, allow nothing to escape.

Tarvin was lying at rest in the veranda of the rest-house, smoking a cheroot and wondering how far he had bettered the case of the Maharaj Kunwar by appealing to the Maharajah. His reflections were not disturbed; the last of the commercial travelers had gone back to Calcutta and Bombay, grumbling up to the final moment of their stay, and the rest-house was all his own. Surveying his kingdom, he meditated, between the puffs of his cheroot, on the desperate and apparently hopeless condition of things. They had got to the precise

point where he liked them. When a situation looked as this one did, only Nicholas Tarvin could put it through and come out on top. Kate was obdurate; the Naulahka was damnable coy; the Maharajah was ready to turn him out of the state. Sitabhai had heard him denounce her. His life was likely to come to a sudden and mysterious end, without so much as the satisfaction of knowing that Heckler and the boys would avenge him; and if it went on, it looked as though it would have to go on without Kate, and without the gift of new life to Topaz—in other words, without being worth the trouble of living.

The moonlight, shining on the city beyond the sands, threw fantastic shadows on temple spires and the watch-towers along the walls. A dog in search of food snuffed dolefully about Tarvin's chair, and withdrew to howl at him at a distance. It was a singularly melancholy howl. Tarvin smoked till the moon went down in the thick darkness of an Indian night. She had scarcely set when he was aware of something blacker than the night between him and the horizon.

"Is it you, Tarvin Sahib?" the voice inquired in broken English.

Tarvin sprang to his feet before replying. He was beginning to be a little suspicious of fresh apparitions. His hand went to his hip-pocket. Any horror, he argued, might jump out at him from the darkness in a country managed on the plan of a Kiralfy trick spectacle.

"Nay; do not be afraid," said the voice. "It is I—Juggut Singh."

Tarvin pulled thoughtfully at his cigar. "The state is full of Singhs," he said. "Which?"

"I, Juggut Singh, of the household of the Maharajah."

"H'm. Does the King want to see me?"

The figure advanced a pace nearer.

"No, Sahib; the Queen."

"Which?" repeated Tarvin.

The figure was in the veranda at his side, almost whispering in his ear. "There is only one who would dare to leave the palace. It is the Gipsy."

Tarvin snapped his fingers blissfully and soundlessly in the dark, and made a little click of triumph with his tongue. "Pleasant calling-hours the lady keeps," he said.

"This is no place for speaking, Sahib. I was to say, 'Come, unless you are afraid of the dark.'"

"Oh, were you? Well, now, look here, Juggut; let's talk this thing out. I'd like to see your friend Sitabhai. Where are you keeping her? Where do you want me to go?"

"I was to say, 'Come with me.' Are you afraid?" The man spoke this time at his own prompting.

"Oh, I'm afraid fast enough," said Tarvin, blowing a cloud of smoke from him. "It is n't that."

"There are horses—very swift horses. It is the Queen's order. Come with me."

Tarvin smoked on, unhurrying; and when he finally picked himself out of the chair it was muscle by muscle. He drew his revolver from his pocket, turned the chambers slowly one after another to the vague light, under Juggut Singh's watchful eye, and returned it to his pocket again, giving his companion a wink as he did so.

"Well, come on, Juggut," he said, and they passed behind the rest-house to a spot where two horses, their heads enveloped in cloaks to prevent them from neighing, were waiting at their pickets. The man mounted one, and Tarvin took the other silently, satisfying himself before getting into the saddle that the girths were not loose this time. They left the city road at a walking pace by a cart-track leading to the hills.

"Now," said Juggut Singh, after they had gone a quarter of a mile in this fashion, and were alone under the stars, "we can ride."

He bowed forward, struck his stirrups home, and began lashing his animal furiously. Nothing short of the fear of death would have made the pampered eunuch of the palace ride at this pace. Tarvin watched him roll in the saddle, chuckled a little, and followed.

"You would n't make much of a cow-puncher, Juggut, would you?"

"Ride," gasped Juggut Singh, "for the cleft between the two hills—ride!"

The dry sand flew behind their horses' hoofs, and the hot winds whistled about their ears as they headed up the easy slope toward the hills, three miles from the palace. In the old days, before the introduction of telegraphs, the opium speculators of the desert were wont to telegraph the rise and fall in the price of the drug from little beacon-towers on the hills. It was toward one of these disused stations that Juggut Singh was straining. The horses fell into a walk as the slope grew steeper, and the outline of the squat-domed tower began to show clear against the sky. A few moments later Tarvin heard the hoofs of their horses ring on solid marble, and saw that he was riding near the edge of a great reservoir, full of water to the lip.

Eastward, a few twinkling lights in the open plain showed the position of Rhatore, and took him back to the night when he had said good-by to Topaz from the rear platform of a Pullman. Night-fowl called to one another from the weeds at the far end of the tank, and a great fish leaped at the reflection of a star.

"The watch-tower is at the further end of

the dam," said Juggut Singh. "The Gipsy is there."

"Will they never have done with that name?" uttered an incomparably sweet voice out of the darkness. "It is well that I am of a gentle temper, or the fish would know more of thee, Juggut Singh."

Tarvin checked his horse with a jerk, for almost under his bridle stood a figure enveloped from head to foot in a mist of pale-yellow gauze. It had started up from behind the red tomb of a once famous Rajput cavalier who was supposed by the country-side to gallop nightly round the dam he had built. This was one of the reasons why the Dungar Talao was not visited after nightfall.

"Come down, Tarvin Sahib," said the voice mockingly in English. "I, at least, am not a gray ape. Juggut Singh, go wait with the horses below the watch-tower."

"Yes, Juggut; and don't go to sleep," enjoined Tarvin—"we might want you." He alighted, and stood before the veiled form of Sitabhai.

"Shekand," she said, after a little pause, putting out a hand that was smaller even than Kate's. "Ah, Sahib, I knew that you would come. I knew that you were not afraid."

She held his hand as she spoke, and pressed it tenderly. Tarvin buried the tiny hand deep in his engulfing paw, and, pressing it in a grip that made her give an involuntary cry, shook it with a hearty motion.

"Happy to make your acquaintance," he said, as she murmured under her breath, "By Indur, he has a hold!"

"And I am pleased to see you, too," she answered aloud. Tarvin noted the music of the voice. He wondered what the face behind the veil might look like.

She sat down composedly on the slab of the tomb, motioning him to a seat beside her.

"All white men like straight talk," she said, speaking slowly, and with uncertain mastery of English pronunciation. "Tell me, Tarvin Sahib, how much you know."

She withdrew her veil as she spoke, and turned her face toward him. Tarvin saw that she was beautiful. The perception thrust itself insensibly between him and his other perceptions about her.

"You don't want me to give myself away, do you, Queen?"

"I do not understand. But I know you do not talk like the other white men," she said sweetly.

"Well, then, you don't expect me to tell you the truth?"

"No," she replied. "Else you would tell me why you are here. Why do you give me so much trouble?"

"Do I trouble you?"

Sitabhai laughed, throwing back her head, and clasping her hands behind her neck. Tarvin watched her curiously in the starlight. All his senses were alert; he was keenly on his guard, and he cast a wary eye about and behind him from time to time. But he could see nothing but the dull glimmer of the water that lapped at the foot of the marble steps, and hear nothing save the cry of the night-owls.

"O Tarvin Sahib," she said. "You know! After the first time I was sorry."

"Which time was that?" inquired Tarvin, vaguely.

"Of course it was when the saddle turned. And then when the timber fell from the archway I thought at least that I had maimed your horse. Was he hurt?"

"No," said Tarvin, stupefied by her engaging frankness.

"Surely you knew," she said almost reproachfully.

He shook his head. "No, Sitabhai, my dear," he said slowly and impressively; "I was n't on to you, and it's my eternal shame. But I'm beginning to sabe. You worked the little business at the dam, too, I suppose, and the bridge and the bullock-carts. And I thought it was their infernal clumsiness! Well, I'll be—" He whistled melodiously, and the sound was answered by the hoarse croak of a crane across the reeds.

The Queen leaped to her feet, thrusting her hand into her bosom. "A signal!" Then, sinking back upon the slab of the tomb, "But you have brought no one with you. I know you are not afraid to go alone."

"Oh, I'm not trying to do *you* up, young lady," he answered. "I'm too busy admiring your picturesque and systematic deviltry. So you're at the bottom of all my troubles? That quicksand trick was a pretty one. Do you often work it?"

"Oh, on the dam!" exclaimed the Queen, waving her hands lightly. "I only gave them orders to do what they could. But they are very clumsy people—only coolie people. They told me what they had done, and I was angry."

"Kill any one?"

"No; why should I?"

"Well, if it comes to that, why should you be so hot on killing me?" inquired Tarvin, dryly.

"I do not like any white men to stay here, and I knew that you had come to stay." Tarvin smiled at the unconscious Americanism. "Besides," she went on, "the Maharajah was fond of you, and I had never killed a white man. Then, too, I like you."

"Oh!" responded Tarvin, expressively.

"By Malang Shah, and you never knew!"

She was swearing by the god of her own clan—the god of the gipsies.

"Well, don't rub it in," said Tarvin.

"And you killed my big pet ape," she went on. "He used to salaam to me in the mornings like Luchman Rao, the prime minister. Tarvin Sahib, I have known many Englishmen. I have danced on the slack-rope before the mess-tents of the officers on the line of march, and taken my little begging-gourd up to the big bearded colonel when I was no higher than his knee." She lowered her hand to within a foot of the ground. "And when I grew older," she continued, "I thought that I knew the hearts of all men. But, by Malang Shah, Tarvin Sahib, I never saw a man like unto you! Nay," she went on almost beseechingly, "do not say that you did not know. There is a love-song in my tongue, 'I have not slept between moon and moon because of you'; and indeed for me that song is quite true. Sometimes I think that I did not quite wish to see you die. But it would be better that you were dead. I, and I alone, command this state. And now, after that which you have told the King—"

"Yes? You heard, then?"

She nodded. "After that I cannot see that there is any other way—unless you go away."

"I'm not going," said Tarvin.

"That is good," said the Queen, with a little laugh. "And so I shall not miss seeing you in the courtyard day by day. I thought the sun would have killed you when you waited for the Maharajah. Be grateful to me, Tarvin Sahib, for I made the Maharajah come out. And you did me an ill turn."

"My dear young lady," said Tarvin, earnestly, "if you'd pull in your wicked little fangs, no one wants to hurt you. But I can't let you beat me about the Maharaj Kunwar. I'm here to see that the young man stays with us. Keep off the grass, and I'll drop it."

"Again I do not understand," said the Queen, bewildered. "But what is the life of a little child to you who are a stranger here?"

"What is it to me? Why, it's fair play; it's the life of a little child. What more do you want? Is nothing sacred to you?"

"I also have a son," returned the Queen, "and he is not weak. Nay, Tarvin Sahib, the child always was sickly from his birth. How can he govern men? *My* son will be a Rajput; and in the time to come— But that is no concern of the white men. Let this little one go back to the gods."

"Not if I know it," responded Tarvin, decisively.

"Otherwise," swept on the Queen, "he will live infirm and miserable for ninety years. I know the bastard Kulu stock that he comes from. Yes; I have sung at the gate of his moth-

er's palace when she and I were children—I in the dust, and she in her marriage-litter. To-day she is in the dust. Tarvin Sahib,"—her voice melted appealingly,—“I shall never bear another son; but I may at least mold the state from behind the curtain, as many queens have done. I am not a palace-bred woman. Those”—she pointed scornfully toward the lights of Rhatore—“have never seen the wheat wave, or heard the wind blow, or sat in a saddle, or talked face to face with men in the streets. They call me the gipsy, and they cower under their robes like fat slugs when I choose to lift my hand to the Maharajah's beard. Their bards sing of their ancestry for twelve hundred years. They are noble, forsooth! By Indur and Allah,—yea, and the God of your missionaries too,—their children and the British government shall remember me for twice twelve hundred years. *Ahi*, Tarvin Sahib, you do not know how wise my little son is. I do not let him go to the missionary's. All that he shall need afterward—and indeed it is no little thing to govern this state—he shall learn from me; for I have seen the world, and I know. And until you came all was going so softly, so softly, to its end! The little one would have died—yes; and there would have been no more trouble. And never man nor woman in the palace would have breathed to the King one word of what you cried aloud before the sun in the courtyard. Now, suspicion will never cease in the King's mind, and I do not know—I do not know—” She bent forward earnestly. “Tarvin Sahib, if I have spoken one word of truth this night, tell me how much is known to you.”

Tarvin preserved absolute silence. She stole one hand pleadingly on his knee. “And none would have suspected. When the ladies of the Viceroy came last year, I gave out of my own treasures twenty-five thousand rupees to the nursing-hospital, and the lady sahib kissed me on both cheeks, and I talked English, and showed them how I spent my time knitting—I who knit and unknit the hearts of men.”

This time Tarvin did not whistle; he merely smiled and murmured sympathetically. The large and masterly range of her wickedness, and the coolness with which she addressed herself to it, gave her a sort of distinction. More than this, he respected her for the personal achievement which of all feats most nearly appeals to the breast of the men of the West—she had done him up. It was true her plans had failed; but she had played them all on him without his knowledge. He almost revered her for it.

“Now you begin to understand,” said Sitabhai; “there is something more to think of.

Do you mean to go to Colonel Nolan, Sahib, with all your story about me?”

“Unless you keep your hands off the Maharaj Kunwar—yes,” said Tarvin, not allowing his feelings to interfere with business.

“That is very foolish,” said the Queen; “because Colonel Nolan will give much trouble to the King, and the King will turn the palace into confusion, and every one of my handmaids, except a few, will give witness against me; and I perhaps shall come to be much suspected. Then you would think, Tarvin Sahib, that you had prevented me. But you cannot stay here forever. You cannot stay here until I die. And so soon as you are gone—” She snapped her fingers.

“You won't get the chance,” said Tarvin, unshakenly. “I'll fix that. What do you take me for?”

The Queen bit the back of her forefinger irresolutely. There was no saying what this man, who strode unharmed through her machinations, might or might not be able to do. Had she been dealing with one of her own race, she would have played threat against threat. But the perfectly composed and loose-knit figure by her side, watching every movement, chin in hand, ready, alert, confident, was an unknown quantity that baffled and distressed her.

There was a sound of a discreet cough, and Juggut Singh waddled toward them, bowing abjectly, to whisper something to the Queen. She laughed scornfully, and motioned him back to his post.

“He says the night is passing,” she explained, “and it is death for him and for me to be without the palace.”

“Don't let me keep you,” said Tarvin, rising. “I think we understand each other.” He looked into her eyes. “Hands off!”

“Then I may not do what I please?” she said, “and you will go to Colonel Nolan tomorrow?”

“That depends,” said Tarvin, shutting his lips. He thrust his hand into his pockets as he stood looking down at her.

“Seat yourself again a moment, Tarvin Sahib,” said Sitabhai, patting the slab of the tomb invitingly with her little palm. Tarvin obeyed. “Now, if I let no more timber fall, and keep the gray apes tied fast—”

“And dry up the quicksands in the Amet River,” pursued Tarvin, grimly. “I see. My dear little spitfire, you are at liberty to do what you like. Don't let me interfere with your amusements.”

“I was wrong. I should have known that nothing would make you afraid,” said she, eying him thoughtfully out of the corner of her eye; “and, excepting you, Tarvin Sahib, there is no man that I fear. If you were a king as

a queen, we would hold Hindustan between our two hands."

She clasped his locked fist as she spoke, and Tarvin, remembering that sudden motion to her bosom when he had whistled, laid his own hand quickly above hers, and held them fast.

"Is there nothing, Tarvin Sahib, that would make you leave me in peace? What is it you care for? You did not come here to keep the Maharaj Kunwar alive."

"How do you know I did n't?"

"You are very wise," she said, with a little laugh, "but it is not good to pretend to be too wise. Shall I tell you why you came?"

"Well, why did I? Speak up."

"You came here, as you came to the temple of Iswara, to find that which you will never find, unless"—she leaned toward him—"I help you. Was it very cold in the Cow's Mouth, Tarvin Sahib?"

Tarvin drew back, frowning, but not betraying himself further.

"I was afraid that the snakes would have killed you there."

"Were you?"

"Yes," she said softly. "And I was afraid, too, that you might not have stepped swiftly enough for the turning stone in the temple."

Tarvin glanced at her. "No?"

"Yes. Ah! I knew what was in your mind, even before you spoke to the King—when the body-guard charged."

"See here, young woman, do you run a private inquiry agency?"

She laughed. "There is a song in the palace now about your bravery. But the boldest thing was to speak to the King about the Naulahka. He told me all you said. But he—even he did not dream that any *feringhi* could dare to covet it. And I was so good—I did not tell him. But I knew men like you are not made for little things. Tarvin Sahib," she said, leaning close, releasing her hand and laying it softly on his shoulder, "you and I are kin indeed! For it is more easy to govern this state—aye, and from this state to recapture all Hindustan from these white dogs, the English—than to do what you have dreamed of. And yet a stout heart makes all things easy. Was it for yourself, Tarvin Sahib, that you wanted the Naulahka, or for another—even as I desire Gokral Seetarun for my son? We are not little people. It is for another, is it not?"

"Look here," said Tarvin, reverently, as he took her hand from his shoulder and held it firmly in his clutch again, "are there many of you in India?"

"But one. I am like yourself—alone." Her chin drooped against his shoulder, and she looked up at him out of her eyes as dark as the lake. The scarlet mouth and the quivering nos-

trils were so close to his own that the fragrant breath swept his cheek.

"Are you making states, Tarvin Sahib, like me? No; surely it is a woman. Your government is decreed for you, and you do what it orders. I turned the canal which the Government said should run through my orange-garden, even as I will bend the King to my will, even as I will kill the boy, even as I will myself rule in Gokral Seetarun through my child. But you, Tarvin Sahib—you wish only a woman! Is it not so? And she is too little to bear the weight of the Luck of the State. She grows paler day by day." She felt the man quiver, but he said nothing.

From the tangle of scrub and brushwood at the far end of the lake broke forth a hoarse barking cough that filled the hills with desolation as water brims a cup. Tarvin leaped to his feet. For the first time he heard the angry complaint of the tiger going home to his lair after a fruitless night of ranging.

"It is nothing," said the Queen, without stirring. "It is only the tiger of the Dungan Talao. I have heard them howling many times when I was a gipsy, and even if he came you would shoot him, would you not, as you shot the ape?"

She nestled close to him, and, as he sank beside her on the stone again, his arm slipped unconsciously about her waist.

The shadow of the beast drifted across an open space by the lake-shore as noiselessly as thistle-down draws through the air of summer, and Tarvin's arm tightened in its resting-place—tightened on a bossed girdle that struck cold on his palm through many folds of muslin.

"So little and so frail—how could she wear it?" resumed the Queen.

She turned a little in his embrace, and Tarvin's arm brushed against one, and another, and then another, strand of the girdle, studded like the first with regular bosses, till under his elbow he felt a great square stone.

He started, and tightened his hold about her waist, with paling lips.

"But we two," the Queen went on, in a low voice, regarding him dreamily, "could make the kingdom fight like the water-buffaloes in spring. Would you be my prime minister, Tarvin Sahib, and advise me through the curtain?"

"I don't know whether I could trust you," said Tarvin, briefly.

"I do not know whether I could trust myself," responded the Queen; "for after a time it might be that I should be servant who have always been queen. I have come near to casting my heart under the hoofs of your horse—not once, but many times." She put her arms around his neck and joined them there, gazing into his eyes, and drawing his head down to

hers. "Is it a little thing," she cooed, "if I ask you to be my king? In the old days, before the English came, Englishmen of no birth stole the hearts of begums, and led their armies. They were kings in all but the name. We do not know when the old days may return, and we might lead our armies together."

"All right. Keep the place open for me. I might come back and apply for it one of these days when I've worked a scheme or two at home."

"Then you are going away—you will leave us soon?"

"I'll leave you when I've got what I want, my dear," he answered, pressing her closer.

She bit her lip. "I might have known," she said softly. "I, too, have never turned aside from anything I desired. Well, and what is it?"

The mouth drooped a little at the corners, as the head fell on his shoulder. Glancing down, he saw the ruby-jeweled jade handle of a little knife at her breast.

He disengaged himself from her arms with a quick movement, and rose to his feet. She was very lovely as she stretched her arms appealingly out to him in the half light; but he was there for other things.

Tarvin looked at her between the eyes, and her glance fell.

"I'll take what you have around your waist, please."

"I might have known that the white man thinks only of money!" she cried scornfully.

She unclasped a silver belt from her waist and threw it from her, clinking, upon the marble.

Tarvin did not give it a glance.

"You know me better than that," he said quietly. "Come, hold up your hands. Your game is played."

"I do not understand," she said. "Shall I give you some rupees?" she asked scornfully. "Be quick, Juggut Singh is bringing the horses."

"Oh, I'll be quick enough. Give me the Naulahka."

"The Naulahka?"

"The same. I'm tired of tippy bridges, and ungit horses, and uneasy arches, and dizzy quicksands. I want the necklace."

"And I may have the boy?"

"No; neither boy nor necklace."

"And will you go to Colonel Nolan in the morning?"

"The morning is here now. You'd better be quick."

"Will you go to Colonel Nolan?" she repeated, rising, and facing him.

"Yes; if you don't give me the necklace."

"And if I do?"

"No. Is it a trade?" It was his question to Mrs. Mutrie.

The Queen looked desperately at the day-star that was beginning to pale in the East. Even her power over the King could not save her from death if the day discovered her beyond the palace walls.

The man spoke as one who held her life in the hollow of his hand; and she knew he was right. If he had proof he would not scruple to bring it before the Maharajah; and if the Maharajah believed—Sitabhai could feel the sword at her throat. She would be no founder of a dynasty, but a nameless disappearance in the palace. Mercifully, the King had not been in a state to understand the charges Tarvin had brought against her in the courtyard. But she lay open now to anything this reckless and determined stranger might choose to do against her. At the least he could bring upon her the formless suspicion of an Indian court, worse than death to her plans, and the removal of Maharaj Kunwar beyond her power, through the interposition of Colonel Nolan; and at the worst—But she did not pursue this train of thought.

She cursed the miserable weakness of liking for him which had prevented her from killing him just now as he lay in her arms. She had meant to kill him from the first moment of their interview; she had let herself toy too long with the fascination of being dominated by a will stronger than her own, but there was still time.

"And if I do not give you the Naulahka?" she asked.

"I guess you know best about that."

As her eye wandered out on the plain she saw that the stars no longer had fire in them; the black water of the reservoir paled and grew gray, and the wild fowl were waking in the reeds. The dawn was upon her, as merciless as the man. Juggut Singh was leading up the horses, motioning to her in an agony of impatience and terror. The sky was against her; and there was no help on earth.

She put her hands behind her. Tarvin heard the snap of a clasp, and the Naulahka lay about her feet in ripples of flame.

Without looking at him or the necklace, she moved toward the horses. Tarvin stooped swiftly and possessed himself of the treasure. Juggut Singh had released his horse. Tarvin strode forward and caught at the bridle, cramming the necklace into his breast-pocket.

He bent to make sure of his girth. The Queen, standing behind her horse, waited an instant to mount.

"Good-by, Tarvin Sahib; and remember the gipsy," she said, flinging her arm out over the horse's withers. "*Heh!*"

A flicker of light passed his eye. The jade handle of the Queen's knife quivered in the saddle-flap half an inch above his right shoulder. His horse plunged forward at the Queen's stallion, with a snort of pain.

"Kill him, Juggut Singh!" gasped the Queen, pointing to Tarvin, as the eunuch scrambled into his saddle. "Kill him!"

Tarvin caught her tender wrist in his fast grip. "Easy there, girl! Easy!" She returned his gaze, baffled. "Let me put you up," he said.

He put his arms about her and swung her into the saddle.

"Now give us a kiss," he said, as she looked down at him.

She stooped. "No, you don't! Give me your hands." He prisoned both wrists, and kissed her full upon the mouth. Then he smote the horse resoundingly upon the flank, and the animal blundered down the path and leaped out into the plain.

He watched the Queen and Juggut Singh disappear in a cloud of dust and flying stones, and turned with a deep sigh of relief to the lake. Drawing the Naulahka from its resting-place, and laying it fondly out upon his hands, he fed his eyes upon it.

The stones kindled with the glow of the dawn, and mocked the shifting colors of the hill. The shining ropes of gems put to shame the red glare that shot up from behind the reeds, as they had dulled the glare of the torches on the night of the little Prince's wedding. The ten-

der green of the reeds themselves, the intense blue of the lake, the beryl of the flashing kingfishers, and the blinding ripples spreading under the first rays of the sun, as a bevy of coots flapped the water from their wings—the necklace abashed them all. Only the black diamond took no joy from the joy of the morning, but lay among its glorious fellows as somber and red-hearted as the troublous night out of which Tarvin had snatched it.

Tarvin ran the stones through his hands one by one, and there were forty-five of them—each stone perfect and flawless of its kind; nipped, lest any of its beauty should be hidden, by a tiny gold clasp, each stone swinging all but free from the strand of soft gold on which it was strung, and each stone worth a king's ransom or a queen's good name.

It was a good moment for Tarvin. His life gathered into it. Topaz was safe!

The wild duck were stringing to and fro across the lake, and the cranes called to one another, stalking through reeds almost as tall as their scarlet heads. From some temple hidden among the hills a lone priest chanted sonorously as he made the morning sacrifice to his god, and from the city in the plain came the boom of the first ward-drums, telling that the gates were open and the day was born.

Tarvin lifted his head from the necklace. The jade-handled knife was lying at his feet. He picked up the delicate weapon and threw it into the lake.

"And now for Kate," he said.

(To be continued.)

AT BREAK OF DAY.

I THOUGHT that past the gates of doom,
Where Orpheus played a strain divine
Of love importunate as mine,
Unto the dwellings of the dead I came through paths of gloom.

Around me, looming dark through cloud,
Vast walls arose whence mournful fell
The shadow and the hush of hell;
And silence, brooding, palpable, inwrapped me like a shroud.

Naught blossomed there; in that chill place
Where longing dwells divorced from hope,
Naught to a joyless horoscope
Lent prophecies of future grace, but—I beheld thy face!

And I awoke,—songs trembling near,—
Awoke and saw day's chariot pass
Bright gleaming o'er the meadow-grass,
And knew this glad earth, without thee, than realms of death more drear!

SHELLS OF THE PEARL-OYSTER.

FISHING FOR PEARLS IN AUSTRALIA:.

EXPERIENCES OF A DIVER.

THAT the pearl was well known and valued as an article of personal adornment in ancient times is amply proved by the frequent references to it in the Bible. Indeed, a Chinese dictionary dating back one thousand years before Christ gives the word and its meaning.

In the days of pagan Rome Pliny writes of pearls as "the most excellent of precious stones." Caligula wore sandals wrought with them, and adorned his wife with strings of the same; and who has not heard of Cleopatra's wondrous pearls, one of which, at a banquet given in Antony's honor, she dissolved in vinegar and drank to her lover's health? Pearls were evidently fashionable in those days, and that the unassuming, modest little gem is still in demand is shown by the thousands engaged in the pearl-fishing industry in tropical waters.

Although pearls are formed in many mollusks, the true pearls of fashion are yielded only by the so-called pearl-oyster, or mother-of-pearl shell, and are found either in the mollusk itself or attached to, or embedded within, the shell. It is believed that most pearls are formed by the intrusion of some foreign substance between the mantle of the mollusk and its shell, which, becoming an irritation, causes the deposit of nacreous¹ matter in concentric layers until the substance is completely encysted. In all probability it is a minute parasite, as pearl-fishers well know that the shells honeycombed by boring parasites are more likely to yield pearls.

The principal market for pearls is Paris. It is supplied by the East and the West Indies, the gulfs of California and Mexico, and Australia, of late years a great number having come from the latter country.

Around the northern and western coasts of Australia the mother-of-pearl shell has been found in great quantities, and it was on these coasts, which are still unexplored, and inhabited only by natives, that the writer gained what knowledge he possesses of pearl-diving as it is followed to-day.

Formerly it was carried on in two ways, by native divers and by dress-divers. A few years ago the aborigines were easily induced to sign a contract binding them to their employer for the diving season, and in remuneration for their labor received the usual pay—food, tobacco, clothing from the neck to the knees, and a blanket. They lived aboard a schooner on the fishing-grounds during the five summer months, diving from small boats without the aid of sinker or other appendage, and in water from twenty to sixty feet deep. Each boat was in charge of a white man, who sculled the boat along and kept his "boys" up to the mark. Excepting an hour for dinner, they remained away from the schooner from sunrise to sunset. A good native diver, if shells were moderately plentiful, would get from sixty to one hundred pairs per day.

A curious feature among the native divers is that toward the end of the season their long, curly, jet-black hair becomes a straw color,

¹ Nacre is a beautiful iridescent substance found lining the interior of the mother-of-pearl shells.

presumably through the action of the salt water and the sun, and forms a ludicrous contrast to their intensely black faces and bodies. Since bleaching the hair has become a "fad" among civilized nations, perhaps the above recipe may prove useful to some of my readers.

Native divers are not in much request at this time, owing to the shell being pretty well worked out in shallow waters, and it has been found by long practical experience that naked

an hour or two if he chooses, can dive much deeper than the natives, and is able to work all the year round. The style of boat universally used for this work is the lugger, which is a good sea-boat and easy to handle. It ranges in size from ten to twenty tons, is filled with air-pumps, and carries a crew of six men and a diver.

The crews are almost entirely Malays, who are brought down from Singapore by the reg-

DRAWN BY W. TABER.

NATIVE DIVERS.

ENGRAVED BY J. W. EVANS.

native divers can not work with any degree of success beyond a depth of ten fathoms. For this reason it will be readily understood that, as the greater part of the shells now found have to be searched for at a depth of water exceeding ten fathoms, they can be obtained only by means of the well-known diving-dress.

During three years spent on the coast of Western Australia I never knew an instance where an aborigine had been broken in to work in a diving-dress, their objection to it arising from some superstition. The greatest depth at which pearl-shells were found in payable quantities when I left, in 1888, was eighteen fathoms, and the main portion of the diving is now done by white men and a few Mongolians.

Dress-diving is by far the most approved method, as the diver can remain under water

ular steamer *Australind*, owned by C. Bethel of London, which runs up and down the coast and supplies the pearlers with provisions, etc., and by which the shells are shipped for the London market. I should mention here that pearl-fishing means not only fishing for pearls, but also for the shells in which they are found, the latter being really the "bread and butter" of the diver, and worth from £100 to £150 per ton. In a ton of shells there is always a quantity of seed-pearls, probably a hundred or more; but good pearls are not to be reckoned on as certainties, as one man may open ten tons and not find a stone worth \$10, while another man may take a small fortune out of a day's gathering. The average weight of a pair of shells is two pounds.

One of the most essential adjuncts to a dress-diver's outfit is a good "tender." It is he who manages the boat, holds the life-line, and looks

DRAWN BY W. TABER.
EXAMINING THE CATCH.

after the general safety of the diver when below. A tender must keep his weather-eye open for squalls and collisions, must attend to signals, and must not get his man mixed up with a diver from another boat. He should so hold the line that he just feels the movements of the worker below, never so tight as to retard free action, and never so slack as to drag on the bottom and probably get foul round a coral-cup's base, and so condemn the diver to a watery grave. Indeed, he should be a wide-awake fellow, quick to act in an emergency and constantly alert.

The mode of working is as follows: A "patch" of shell having been discovered, the boats beat up to the windward edge, and then drift down over it with a fouled anchor; that is, with the anchor upside down, so that it does not catch, but allows the boat to drag slowly over the ground, the speed of drifting being regulated by paying out more or less chain. When the diver finds that he is off the patch he comes up, the boat tacks to windward again, and drifts over it as before. A patch being often one or two square miles in area, it is next to impossible to go over the same ground twice, though the entire fleet of 150 boats often work on the same patch.

In the year 1885, fortune and a little bark named the *Day Dawn* stranded me in the

almost unknown port of Cossack, Northwest Australia, at that time the headquarters of the pearling-fleet. Cossack was by no means an imposing place. A barren sand-hill, which was an island at high water, with three hotels, a post-office, one general store, and a few shanties along the beach, comprised the city.

It was here that I first became interested in pearling, and a visit to the grounds so infatuated me that I determined to go into the business. After a good deal of haggling I bought a smart little boat named the *Norma* from a diver who had made a pile and was in a great hurry to spend it. After putting the diving-apparatus, provisions, and crew aboard, I cast around for a good diver, and was esteemed fortunate in securing the services of one Joe, a genuine cockney, noted for his luck in getting shell and for the atmosphere of oaths with which he surrounded himself. The adjectives used by Joe were certainly the most emphatic and original that I ever heard. I engaged him on his own terms, which were, \$100 per month, and \$100 per ton of shell collected.

With everything aboard, and a fair wind, it

DIVER AND SHARK.

was with a light heart and visions of pearls that I hoisted the sails of my little craft, and steered for the "grounds," some two hundred miles up the coast, where, three days later, we dropped our anchor and became one among many white sails which, in the stillness of the evening air, were reflected in old Father Neptune's mirror.

Next morning we began work, and for a few days all went as well as could be expected. We were on a good patch, and Joe was sending up the shells in a pretty lively fashion; I was tending his life-line, and to supply him with the requisite air the pump was worked by the Malay boys in turns. But suddenly we had to suspend operations, as the boat started to leak so badly that there was nothing for it but to run for the nearest creek and to make repairs. I found that the *Norma* required calking fore and aft, and a couple of bolts put through her keelson; and to get this done I had to borrow a carpenter from one of the schooners, taking a week to finish the

DRAWN BY W. TABER.
DIVER AND TURTLE.

work. In the mean time Joe, his occupation gone for the nonce, had found one that evidently suited him better—that of drinking. Hollands gin (familiarily known as “square face,” on account of the large square bottles in which it is put up) is the favorite beverage among the members of the pearling fraternity, and as Joe was stowing away a bottle a day he was constantly in a “pickled” condition.

Once again we were ready to start, all except Joe, who, knowing I could do nothing without him, wanted a few more days to finish his spree. I coaxed and entreated, but to no purpose; expenses were going on, and nothing coming in, and, after two days of impatience and chafing under my own helplessness, I made up my mind to try to dive myself, and the next tide I left the creek with that intent. The following day I made my first descent, and it is impressed very vividly on my memory.

Long before old Sol had made his appearance above the horizon that morning I crept up on deck to take a survey of my surroundings. The first streaks of dawn were lighting up the eastern sky, and in the distance I could see the dim outline of the “ninety-mile” beach, ninety miles without a hill or tree, creek or habitation—nothing but white, glistening sand. Beneath, the “mighty liquid metronome” lay calm and peaceful, unruffled as yet by the morning breeze, and all around were anchored the pearlers. At sunrise I called the boys, told them of my plans, and chose one named Ketchee for my tender. After partaking of our morning coffee I proceeded, with Ketchee’s help, to don the ponderous diving-dress. The rubber suit, all in one piece, and which one gets into through the neck, was the first article to put on; then the leaden-soled boots and the corselet, to which the helmet is screwed, and

the chest- and back-weights—in all weighing some fifty or sixty pounds. I stepped on the ladder hanging over the boat’s side, and had the life-line, air-pipe, and helmet attached; then the order to pump was given, and, last of all, the face-glass was screwed up. Oh, that there had been a wrench with which to screw up my courage as well! It had sunk to the bottom of those leaden-soled boots, and though Ketchee tapped the helmet, intimating that all was ready, I felt loath to let go. Thoughts of sharks, octopi, and other monsters of the deep flew through my brain, and I felt sure that the pipe would burst, or the boys stop pumping, or some unforeseen accident would occur.

As I hesitated, thinking of some excuse to have that face-glass taken off again, I glanced up at Ketchee, still undecided what to do, and saw him grinning all over his yellow face at my discomforture. That decided me; I could n’t stand being laughed at

DRAWN BY W. TABER.

ENGRAVED BY GEO. P. BARTLE.

A DIVER AT A DEPTH OF 100 FEET.

by a Malay; so without more ado I grasped the guiding-line firmly, and dropped.

Splash! The water closed over me with a

buzzing sound, and the air whistled in at the top of the helmet with a weird noise, and I saw the bottom of the boat just above me. My ears began to ache, and the pain increased as I slid down and down, until I fairly yelled with the agony caused by the unusual pressure of air on the ear-drums. Still swiftly down I went—would the bottom never touch my kicking feet? At last I reached it with a thud, and instantly all pain ceased, and I scrambled to my feet, full of curiosity.

My first thought was, how foolish I had been to dread leaving the monotonous sea and sky above, when, only ten fathoms below, lay an everchanging scene of beauty—a paradise, although a watery one. The ground I stood upon was rock of coral structure, grown over with coral-cups from minute size to four and five feet in diameter. Sponges as high as one's head, sponge-cups, graceful coral-lines, and sea-flowers of new and beautiful forms, and tinted with all the hues of the rainbow, waved gently to and fro; while, like butterflies, flitting and chasing one another in and out among them all, were hundreds of tiny fishes, so gay with colors that the historical coat of Joseph would have paled beside them.

Truly it was an enchanting scene, so bright, so beautiful, and so novel withal, that I walked about with curious delight, forgetful of all the means which enabled me to intrude upon the fishes' dominion until I was brought to my senses by a sharp jerk on the life-line. This being an interrogation from Ketchee as to whether I was all right, I answered it in a similar way, and, as I did so, a familiar object caught my eye in the shape of an empty beer-bottle. It stood upright on a little ledge of rock, and I could read its flaming yellow label of world-wide reputation. "Ye Gods!" I cried, "what vulgarity! An advertisement even here! Is there no place on the earth or under the waters where one can escape the odious advertiser?" And then for the first time I began to realize my position: my head was aching, and I was breathing in quick, short gasps; I was oppressed, and an uncanny, eery feeling crept over me as I tried to pierce the dim azure of the distance beyond, where the shadowy sea-fans moved so languidly, and my imagination conjured up huge forms in the distance.

I was getting nervous, and had therefore been down long enough; so I gave the signal to pull up, and in a few moments was greedily drinking in the pure, fresh air of heaven through the open face-glass. My nose and ears were bleeding profusely, and I spat a good deal of blood also, but as I had been told that this would happen the first time, I was not alarmed. The pressure had opened a communication between

the mouth and the ears, and I could now perform the extraordinary feat of blowing a mouthful of smoke through my ears, which all divers can do. After this I experienced no pain whatever when descending, and soon became a fairly good diver.

It was on my third descent that I found the first shell. It contained three pearls, which I had set in a ring as a memento, and wore until quite lately, when I discovered that it showed to better advantage on a whiter and more delicate hand than mine, and in the cause of art transferred it thither.

My largest day's work was three hundred and ten pairs of shells; this is rather over a quarter of a ton. The greatest number on record collected in one day is one thousand and five. These were picked up by "Japanese Charley," a little Jap about five feet high, who was al-

DRAWN BY W. TABER.

FINDING THE BOTTLE.

ways tended by his wife, and whose boat was the prettiest model and the smartest sailer in the fleet. The most valuable pearl discovered on this coast is that known as the "Southern Cross"—a cluster of six pearls in the shape of a crucifix which was exhibited at the Indian and Colonial Exhibition, London, in 1886, and was valued at \$50,000. This pearl was found at low water by an old beach-comber, and was sold by him for £10.

The diver, as the reader may imagine, gets many scares when below. A fifteen-foot shark, magnified by the water, and making a bee-line for one, is sufficient to make the stoutest heart quake, in spite of the assertion that sharks have never been known to attack a man in dress. Neither is the sight of a large turtle comforting when one does not know exactly what it is, and the coiling of a sea-snake around one's legs, although it has only one's hands to bite at, is, to

DRAWN BY W. TABER.

AFTER A SQUALL.

ENGRAVED BY H. E. SYLVESTER.

say the least, unpleasant. A little fish called the stone-fish is one of the enemies of the diver. It seems to make its habitation right under the pearl-shell, as it is only when picking them up that any one has been known to be bitten. I remember well the first time I was bitten by this spiteful member of the finny tribe. I dropped my bag of shells, and hastened to the surface; but in this short space of time my hand and arm had so swollen that it was with difficulty I could get the dress off, being unable to work for three days, and suffering intense pain the while. Afterward I learned that staying down a couple of hours after a bite will stop any further discomfort, the pressure of water causing much bleeding at the bitten part, and thus expelling the poison.

One of the strange effects that diving has upon those who practise it is the invariable bad temper felt while working at the bottom; and as this irritability passes away as soon as the surface is reached again, it is only reasonable to suppose that it is caused by the unusual pressure of air inside the dress, affecting probably the lungs, and through them the brain. My experience has been that while below one may fly into the most violent passion at the merest trifle; for instance, the life-line held too tight or too slack, too much air or too little, or some imaginary wrong-doing on the part of the tender or the boys above, will often cause the temper to rise. I have sometimes become so angry in a similar way that I have given the signal to pull up, with the express intention of knocking the heads off the entire crew; but as the surface was neared, and the weight of air decreased, my feelings have gradually undergone a change for the better, until by the time I reached the ladder, and had the face-glass unscrewed, I had forgotten for what I came up. It is evident from the number whom I have known to make a first descent, and who afterward positively refused to try again, that all men are not born to be divers. At one time I had for my tender a brawny young

Scotchman named Rob, a six-footer, about twenty-three years of age, and as fine a specimen of the genus *Homo* as I ever came across. As was to be expected, Rob had a sweetheart in the "auld countree," and the one aim and end of his life was to make a fortune wherewith to return and marry the girl of his choice. He had tried the Kimberley gold-fields, and the Silverton silver-fields, without success, and was now anxious to try his luck at diving. I told Rob that I would put him down the first slack day we had to see how he liked it, and when that day arrived, with a few parting injunctions from me as the face-glass was put on, down he went, I acting as his tender. I felt him land on the bottom and begin walking from the boat; he answered the signals all right, and I anticipated no trouble, but before he had been down three minutes he was foul of the anchor-chain, and I had to pull the anchor and Rob up together. By this time he had become thoroughly frightened, and was screaming inside the dress to be pulled up; he had also lost his presence of mind, and had screwed the used-air escape-valve at the side of the helmet the wrong way, thus keeping in the constant supply of air from the pump above, and the dress was in danger of bursting. As soon as we got him alongside I unscrewed the valve, and he was soon on deck, laughing over his mistakes.

About a week after this he made a second attempt, and this time nearly lost his life. As before, he became alarmed, thought that there was too much air in the dress, and tried to let it out by the escape-valve, but screwed it up the wrong way again, shutting in the air; and then, finding the air still increasing in pressure, his presence of mind again deserted him, and he began to take off the face-glass. Fortunately for Rob, his girl, and my apparatus, he lost consciousness before he quite got it off, and we hauled him to the ladder, kicking and yelling like a madman. He remained delirious for several hours, and when at length he came to his senses, and recovered from his

fright, we concluded that diving was not his forte, and that his fortune would have to be made in some other way.

Though pearl-diving, if the fates are propitious, is a lucrative occupation, its dangers are manifold. In the community in which one has to live may be found some of the "toughest" men on earth. A mixture of all nationalities far worse than one meets on a gold-field, and an exciting calling, without restraint or law, are not likely to form a peaceful community. A diver is always at the tender mercies of his Malay crew, and the slightest accident to his

apparatus, such as the breaking of the pump or the air-pipe, ripping the dress, getting entangled on the bottom, or even losing his presence of mind, may end fatally. Then, again, it is most injurious to the health, some dying from the effects after a few months, while deafness and incipient paralysis are common features. But worse than all these are the terrible cyclones that visit the coast, carrying everything before them, and leaving only a track of death and the flotsam and jetsam of wrecked hopes to mark their passage.

Hubert Phelps Whitmarsh.

NECKLACE OF DIAMONDS AND AMERICAN PEARLS.

KHAMSIN.

O H, the wind from the desert blew in!—
Khamsein,
The wind from the desert blew in!
It blew from the heart of the fiery South,
From the fervid sand and the hills of drouth,
And it kissed the land with its scorching
mouth;
The wind from the desert blew in!

It blasted the buds on the almond bough,
And it shriveled the fruit on the orange-tree;
The wizened dervish breathed no vow,
So weary and parched was he.
The lean muezzin could not cry;
The dogs ran mad, and bayed the sky;
The hot sun shone like a copper disk,
And prone in the shade of an obelisk
The water-carrier sank with a sigh,
For limp and dry was his water-skin;
And the wind from the desert blew in.

The camel crouched by the crumbling wall,
And oh, the pitiful moan it made!
The minarets, taper and slim and tall,

Reeled and swam in the brazen light,
And prayers went up by day and night,
But thin and drawn were the lips that prayed.
The river writhed in its slimy bed,
Shrunk to a tortuous, turbid thread ;
The burnt earth cracked like a cloven rind ;
And still the wind, the ruthless wind
Khamzin,
The wind from the desert blew in.

Into the cool of the mosque it crept,
Where the poor sought rest at the Prophet's
 shrine ;
Its breath was fire to the jasmine vine ;
It fevered the brow of the maid who slept ;
And men grew haggard with revel of wine.
The tiny fledglings died in the nest ;
The sick babe gasped at the mother's breast ;
Then a rumor rose and swelled and spread
From a tremulous whisper, faint and vague,
Till it burst in a terrible cry of dread,—
 The plague ! The plague ! The plague !
 Oh, the wind Khamzin,
The scourge from the desert blew in !

Clinton Scollard.

OL' PAP'S FLAXEN.

BY HAMLIN GARLAND,

Author of "Main Traveled Roads," "Jason Edwards," etc.

DRAWN BY GEORGE W. COHEN.

"WELL, AIN'T IT PURTY SHORT, PAP?"

ENGRAVED BY J. H. E. WHITNEY.

II.

ONE morning, eight years later, Flaxen left the home of Gearheart and Wood with old Doll and the buggy, bound for Belleplain after groceries for harvest. She drove with a dash, her hat on the back of her head. She was seemingly intent on getting all there was possible out of a chew of kerosene gum, which she had resolved to throw away upon entering town, intending to get a new supply.

She had thriven on western air and gum, and though hardly more than fourteen years of age, her bust and limbs revealed the grace of

approaching womanhood, however childish her short dress and braided hair might still show her to be. Her face was broad and decidedly of Scandinavian type, fair in spite of wind and sun, and broad at the cheek-bones. Her eyes were as blue and clear as winter ice.

As she rode along she sang as well as she could without neglecting the gum, sitting at one end of the seat like a man, the reins held carelessly in her left hand, notwithstanding the swift gait of the horse, who always knew when Flaxen was driving. She met a friend on the road, and said, "Hello!" pulling up her horse with one strong hand.

"Can't stop," she explained; "got to go over to the city to get some groceries for harvest. Goin' to the sociable to-morrow?"

"You bet," replied the friend. "You?"

"I d'know; mebbe, if the boys'll go. Ta-ta; see ye later." And away she spun.

Belleplain had not thriven, or, to be more exact, it had had a rise and fall; and as the rise had been considerable, so the fall was something worth chronicling. It was now a collection of wooden buildings, mostly empty, graying under the storms and suns of the pitiless winters and summers, and now, just in mid-summer, surrounded by splendid troops and phalanxes of gorgeous sunflowers, whose brown crowns, gold-dusted, looked ever toward the sun as it swung through the wide arch of cloudless sky. The signs of the empty buildings still remained, and one might still read the melancholy decline from splendors of the past in "emporiums," "palace drug-stores," and "mansion-houses."

As Flaxen would have said, "Belleplain's boom had bu'sted." Her glory had gone with the C. B. and Q., which formed the junction at Boomtown and left the luckless citizens of Belleplain "high and dry" on the prairie, with nothing but a "spur" to travel on. However, a few stores yet remained in the midst of desolation.

After making her other purchases, Flaxen entered the "red-front drug-store" to secure the special brand of gum which seemed most delectable and to buy a couple of cigars for the "boys."

The clerk, who was lately from the East, and wore his mustache curled upward like the whiskers of a cat, was "gassing" with another young man, who sat in a chair with his heels on the counter.

"Well, my dear, what can I do for you to-day?" he said, winking at the loafer, as if to say, "Now watch me."

"I want some gum."

"What kind, darling?" he asked, encouraged by the fellow in the chair.

"I ain't your darling. Kerosene, shoo-fly, an' ten cents' worth."

"Say, Jack," drawled the other fellow, "git on to the ankles! Say, sissy, you picked your dress too soon. She's goin' to be a daisy, first you know. Ain't ye, honey?" he said, leaning over and pinching her arm.

"Let me alone, you great mean thing! I'll tell ol' pap on you, see if I don't," cried Flaxen, her eyes filling with angry tears. And as they proceeded to other and bolder remarks she rushed out, feeling vaguely the degradation of being so spoken to and so touched. It seemed all the more atrocious the more she thought upon it.

When she reached home there were still

signs of tears on her face, and when Anson came out to help her alight and, noticing it, asked, "What 's the matter?" she burst out afresh, crying, and talking incoherently.

"Why, what 's the matter, Flaxie? Can't you tell ol' pap? Are ye sick?"

She shook her head, and rushed past him into the house and into her bedroom, like a little cyclone of wrath. Ans' slowly followed her, much perplexed. She was lying face downward on the bed, sobbing.

"What 's the matter, little one? Can't you tell ol' pap? Have the girls be'n makin' fun o' ye again?"

She shook her head.

"Have the boys be'n botherin' ye?" No reply. "Who was it?" Still silence. He was getting stern now. "Tell me right now."

"Jack Reeves—an'—an' another feller."

"Wha' d' they do?" Silence. "Tell me."

"They—pinched me, an'—an'—talked mean to me," she replied, breaking down again at the memory of the insult. Anson divined not a little of how she had been treated.

"Wal, there! You dry yer eyes, Flaxie, an' go an' git supper; they won't do it again—not this harvest," he added grimly, as he marched to the door to enter the buggy.

Bert, coming along from the barn and seeing Anson about to drive away, asked where he was going.

"Oh, I've got a little business to transact with Reeves and some other smart Aleck down town."

"What 's up? What have they be'n doin'?" asked Gearheart, reading trouble in the eye of his friend.

"Well, they have be'n a little too fresh with Flaxen to-day, an' need a lesson."

"They're equal to it. Say, Anson, let me go," laying his hand on the dasher, ready to leap in.

"No; you're too brash. You would n't know when to quit. No; you stay right here. Don't say anythin' to Flaxen about it; if she wants to know where I'm gone, tell her I found I was out o' nails."

As Anson drove along swiftly he was in a savage mood and thinking deeply. Two or three times of late some of his friends' had touched rather freely upon the fact that Flaxen was becoming a woman. "Girls ripen early out in this climate," one old chap had said, "and your little Norsk there is likely to leave you one of these days." He felt now that something deliberately and inexpressibly offensive had been said and done to his little girl. He did n't want to know just what it was, but just who did it; that was all. It was time to make a protest. Hitching his horse to a ring in the sidewalk upon arrival, he walked into the drug-

store, which was also the post-office. Young Reeves was inside the post-office corner giving out the mail, and Anson sauntered about the store waiting his chance.

He was a dangerous-looking man just now. Ordinarily his vast frame, huge, grizzled beard, and stern, steady eyes would quell a panther; but now as he leaned against the counter a shrewd observer would have said, "Look out for him; he's dangerous." His gray shirt, loose at the throat, showed a neck that resembled the spreading base of an oak-tree, and his crossed limbs and half-recumbent pose formed a curious opposition to the look in his eyes.

Nobody noticed him specially. Most comers and goers, being occupied with their mail, merely nodded and passed on.

Finally some one called for a cigar, and Reeves, having finished in the post-office department, came jauntily along behind the counter directly to where Anson stood. As he looked casually into the giant's eyes he started back, but too late; one vast hand had clutched him by the collar, and he was jerked over the counter as though he were a rag-baby, and cuffed from hand to hand, like a mouse in the paws of a cat. Though Ans' used his open palm, the punishment was fearful. Blood burst from his victim's nose and mouth; he yelled with fright and pain.

The rest rushed to help.

"Stand back! This is a private affair," said Ans' in unmistakable tones, throwing up a warning hand. They paused; all knew his strength.

"It was n't me," screamed Reeves, as the punishment increased; "it was Doc Coe."

Coe, his hands full of papers and letters, horrified at what had overtaken Reeves, stood looking on. But now he tried to escape. Flinging the battered, half-senseless Reeves back over the counter, where he lay in a heap, Anson caught Coe by the coat, just as he was rushing past him, and duplicated the punishment, ending by kicking him into the street, where he lay stunned and helpless. Ans' said then, in a voice that the rest heard, "The next time you insult a girl, you'd better inquire into the qual'ties o' her guarddeen."

This little matter attended to, he unhitched his horse from the sidewalk, and, refusing to answer all questions, rode off home, outwardly as calm as though he had just been shaking hands.

Supper was about ready when he drove up, and through the open door he could see the white-covered table and could hear the cheerful clatter of dishes. Flaxen was whistling. Eight years of hard work had not done much for these sturdy souls; but they had managed to secure with incredible toil a comfortable little house

surrounded with outbuildings. Calves and chickens gave life to the barnyard, and fields of wheat rippled and ran with swash of heavy-bearded heads and dapple of shadow and sheen.

Flaxen was now the housewife and daughter of these hard-working pioneers, and a cheery and capable one she had become. No one had ever turned up with a better claim to her, and so she had grown up with Ans' and Bert, going to school when she could spare the time, but mainly being adviser and associate at the farm.

Ans' and Bert had worked hard winter and summer trying to get ahead, but had not succeeded as they had hoped. Crops had failed for three or four years, and money was scarce with them; but they had managed to build this small frame-house and to get a little stock about them, and this year, with a good crop, would "swing clear," and be able to do something for Flaxen—perhaps send her to Belleplain to school, togged out like a little queen.

When Anson returned to the house after putting out the horse, he found Bert reading the paper in the little sitting-room and Flaxen putting the tea on the stove.

"Wha' d' ye do to him, pap?" laughed she, all her anger gone. Bert came out to listen.

"Oh, nothin' p'tic'lar," answered Ans', flinging his hat at a chicken that made as though to come in, and rolling up his sleeves preparatory to sozzling his face at the sink. "I jest cuffed 'em a little, an' let 'em go."

"Is that all?" said Flaxen, disappointedly, a comical look on her round face.

"Now, don't you worry," put in Bert. "Anson's cuffin' a man is rather a severe experience. I saw him cuff a man once; it ain't anythin' to be desired a second time."

They all drew about the table. Flaxen looked very womanly as she sat cutting the bread and pouring the tea. She had always been old in her ways about the house, for she had very early assumed the housewife's duties and cares. Her fresh-colored face beamed with delight as she watched the hungry men devouring the fried pork, potatoes, and cheese.

"When ye goin' to begin cuttin', boys?" Collectively they were boys to her, but when addressing them separately they were "Bert" and "pap."

"To-morrow er nex' day, I guess," answered Anson, looking out of the open door. "Don't it look fine?—all yell'er an' green. I tell ye they ain't anythin' lays over a ripe field o' wheat in my eyes. You jest take it when the sun strikes it right, an' the wind is playin' on it,—when it kind o' swashes about like a lake,—an' the clouds go over it, droppin' shadders down on it, an' a hawk kind o' goes skimmin' over it, divin' into it once in a while—"

He did not finish; it was not necessary.

"Yes, sir!" adjudged Gearheart, after a pause, leaning his elbows on the table and looking out of the door on the far-stretching, sun-glorified plain.

"The harvest kind o' justifies the winter we have out here. That is, when we have a harvest such as this. Fact is, we fellers live six months o' the year lookin' ahead to harvest, and t' other six months lookin' back to it. Well, this won't buy the woman a dress, Ans'. We must get that header set up to-night if we can."

They pushed their chairs back noisily, and rose to go out. Flaxen said:

"Say, which o' you boys is goin' to help me churn to-night?"

Anson groaned, while she laughed.

"I don't know, Flax; ask us an easier one."

"We'll attend to that after it gets too dark to work on the machine," added Bert.

"Well, see 't ye do. I can't do it; I've got bread to mix an' a chicken to dress. Say, if you don't begin cuttin' till day after to-morrow, we can go down to the sociable to-morrow night. Last one o' the season."

"I wish it was the last one before the kingdom come," growled Bert as he "stomped" out the door. "They're a bad lot. The idea o' takin' down four dollars' worth o' grub an' then payin' four dollars fer the privilege of eatin' half of it! I'll take my chicken here, when I'm hungry."

"Bert ain't partial to sociables, is he, pap?" laughed Flaxen.

"I should hate to have the minister dependin' on Bert fer a livin'."

"Sa-ay, pap!"

"Wal, babe?"

"I expect I'll haf to have a new dress one o' these days."

"Think so?"

"You bet."

"Why, what's the matter with the one ye got on? Ain't no holes in it that I can see," looking at it carefully and turning her around as if she were on a pivot.

"Well, ain't it purty short, pap?" she said suggestively.

"I swear, I don't know but it is," conceded Anson, scratching his head; "I had n't paid much 'tention to it before. It certainly is a—lee-tle too short. Lemme see, ain't no way o' lettin' it down, is they?"

"Nary. She's clean down to the last notch now," replied Flaxen, convincingly.

"Could n't pull through till we thrash?" he continued, still in a tentative manner.

"Could, but don't like to," she answered, laughing again, and showing her white teeth pleasantly.

"I s'pose it'll cost suthin'," he insinuated in a dubious tone.

"Mattie Stuart paid seven dollars fer hern, pap, an' I—"

"Seven how manys?"

"Dollars, pap, makin' an' everythin'. An' then I ought to have a new hat to go with the dress, an' a new pair o' shoes. All the girls are wearin' white, but I reckon I can git along with a good colored one that'll do fer winter."

"Wal, all right. I'll fix it—some way," Ans' said, turning away only to look back and smile to see her dancing up and down and crying:

"Oh, goody, goody!"

"I'll do it if I haf to borrow money at two per cent. a month," said he to Bert, as he explained the case. "Hear her sing! Why, dern it! I'd spend all I've got to keep that child twitterin' like that. Would n't you, eh?"

Bert was silent, thinking deeply on a variety of matters roused by Anson's words. The crickets were singing from out the weeds near by; a lost little wild chicken was whistling in plaintive sweetness down the barley-field; the flaming light from the half-sunk sun swept along the green and yellow grain, glorifying as with a bath of gold everything it touched.

"I wish that grain had n't ripened so fast, Ans'. It's blightin'."

"Think so?"

"No; I know it. I went out to look at it before supper, an' every one of those spots that look so pretty are just simply burnin' up! But, say, ain't it a little singular that Flaxen should blossom out in a desire fer a new dress all at once? Ain't it rather sudden?"

"Wal, no; I don't think it is. Come to look it all over, up one side an' down the other, she's been growin' about an inch a month this summer, an' her best dress is gittin' turrible short the best way you can fix it. She's gittin' to be 'most a woman, Bert."

"Yes; I know she is," said Bert, significantly. "An' something's got to be done right off."

"Wha' d' ye mean by that, ol' man?"

"I mean jest this. It's time we did something religious fer that girl. She ain't had much chance since she's been here with us. She ain't had no chance at all. Now I move that we send her away to school this winter. Give her a good outfit an' send her away. This ain't no sort o' way fer a girl to grow up in."

"Wal, I've be'n thinkin' o' that myself; but where'll we send her?"

"Oh, back to the States somewhere; Wisconsin or Minnesota—somewhere."

"Why not to Boomtown?"

"Well, I'll tell ye, Ans'. I've been hearin' a good 'eal off an' on about the way we was bringin' her up here 'alone with two rough

old codgers,' and I jest want to give her a better chance than the Territory affords. I want her to git free of us and all like us fer a while; let her see somethin' o' the world. Besides, that business over in Belleplain to-day kind o' settled me. The plain facts are, Ans', the people are a little too free with her because she is growin' up here—"

"I know some fellers that won't be again."

"Well, they are beginnin' to wink an' nudge each other an' to say—"

"Go on! What do they say?"

"They say she's goin' to be a woman soon; that this fatherly business is bound to play out."

"I'd like to see anybody wink when I'm around. I'd smash 'em!" said Anson through his set teeth. "Why, she's our little babe—my little un; I'm her ol' pap. Why—" he ended in despair.

"There ain't no use o' howlin', Ans'. You can't smash a whole neighborhood."

"But what are we goin' to do?"

"Well, I'll tell ye what we must n't do. We must n't tog her out jest yet."

"Why not?" asked Anson, not seeing these subtle distinctions of time and place.

"Because, you tog her out this week or next, without any apparent reason, in a new hat an' dress an' gloves, an' go down to one o' these sociables with her, an' you'd have to clean out the whole crowd. They'd all be winkin' an' nudgin' an' grinnin', see?"

"Wal, go on," said the crushed giant. "What'll we do?"

"Jest let things go on as they are fer the present till we git ready to send her to school."

"But I promised the togs."

"All right. I've stated the case," Gearheart returned, with the air of a man who washed his hands of the whole affair.

"Jest hear her! whistlin' away like a lark. I don't see how I'm goin' to go in there an' spoil all her fun; I can't do it, that's all."

"Well, now, you leave it all to me. I'll state the case to her in a way that'll catch her, see if it don't. She ain't no common girl."

It was growing dark as they went in, and the girl's face could not be seen.

"Well, Bert, are ye ready to help churn?"

"Yes, I guess so, if Ans' 'll milk."

"Oh, he'll milk; he jest loves to milk ol' Brindle when the flies are thick."

"Oh, you bet," said Ans', to make her laugh.

"Ahem, Flaxen," coughed Gearheart in beginning, "we've been discussin' your case, an' we've come to the conclusion that you ought to have the togs specified in the indictment" (this to take away the gravity of what was to follow); "but we're kind o' up a tree about jest what we'd better do. The case is

this. We've got to buy a horse to fill out our team, an' that's a-goin' to take about all we can rake an' scrape. We may have to git our groceries on tick. Now, if you could only pull through till after—"

"It's purty tough, Flaxie, an' pap's awful sorry; but if you could jest pull through—"

It was a great blow to poor little Flaxen, and she broke down and cried unrestrainedly.

"I—I—don't see why I can't have things like the rest o' the girls." It was her first reproach, and it cut to the heart. Anson swore under his breath, and was stepping forward to say something when Gearheart restrained him.

"But, ye see, Flaxie, we ain't askin' ye to give up the dress, only to wait on us fer a month or so, till we thrash."

"That's it, babe," said Anson, going over to where she sat, with her arms lying on the table and her face hidden upon them. "We could spend dollars then where we could n't cents now."

"And they won't be any more thingumyjigs at the church, anyhow, and the wheat's blightin' on the knolls, besides."

But the first keen disappointment over, she was her brave self once more.

"Well, all right, boys," she said, her trembling voice curiously at variance with her words; "I'll get along somehow, but I tell you I'll have something sumptuous to pay for this—see if I don't." She was smiling again faintly. "It'll cost more'n *one* ten dollars fer my togs, as you call 'em. Now, pap, you go an' milk that cow! An', Bert, you glue yerself to that churn-dasher, an' don't you stop to breathe er swear till it's done."

"That's the girl to have! that's our own Flaxen! She knows how hard things come on a farm."

"I bet I do," she said, wiping away the last trace of her tears, and smiling at her palpable hit. And then began the thump of the dasher, and out in the dusk Anson was whistling as he milked.

She went down to the sociable the next night in her old dress, and bravely looked happy for pap's sake. Bert did not go. Anson was a rather handsome old fellow. Huge, bearded like a Russian, though the color of his beard was a wolf brindle, resembling a bunch of dry buffalo-grass, Bert was accustomed to say that he looked the father of the girl, for she had the same robust development, carried herself as erect, and looked everybody in the eye with the same laughing directness.

There were some sly remarks among a ribald few, but on the whole everything passed off as usual. They were both general favorites, and as a matter of fact few people remarked that Flaxen's dress was not good enough. She

certainly forgot all about it, so complete was her absorption in the gaiety of the evening.

"Wal, now fer four weeks' hard times, Flaxen," said Anson, as they were jogging homeward about eleven o'clock.

"I can stand my share o' it, pap," she stoutly replied. "I 'm no chicken."

ALL through those four or five weeks, at every opportunity, the partners planned the future of their waif. In the harvest-field, when they had a moment together, one would say to the other:

"We 'll let her stay two years, if she likes it, eh?"

"Certainly; she need n't come back till she wants to. We may be rich enough to sell out then, and move back ourselves. I 'm gittin' tired o' this prairie myself. If we could sell, we 'd put her through a whole course o' sprouts, eh?"

"You bet. Sell when you can find a buyer. I 'll sign the deed."

"All right."

And then they would go to work again toiling and planning for the future. Every day during August these men worked with the energy of demons, up early in the morning and out late at night, harvesting their crop. All day the header clattered to and fro with Bert or Ans' astride the rudder, a cloud of dust rolling up from the ground, out of which nimbus the painted flanges of the reel flashed like sword-strokes. All day, and day after day, while the gulls sailed and soared in the hazy air and the lark piped from the dun grass, these human beings, covered with grime and sweat, worked in heat and parching wind. And never for an hour did they forget their little waif and her needs.

One night toward the last of the harvest they were returning along the road from a neighboring farm, where they had been to head some late wheat. The tired horses with down-hung heads and swinging traces were walking sullenly but swiftly along the homeward road, the wagon rumbling sleepily; the stars were coming out in the east while yet the rose and amethyst of the fallen sun lighted the western sky. Through the air, growing moist, came the sound of reapers still going. Men were shouting blithely, while voices of women and children came from the cabins, where yellow lights began to twinkle.

Anson and Bert, blackened with dust and perspiration, and weary to the point of listlessness, sat with elbows on knees, talking in low, slow tones on the never-failing topic, crops and profits.

"There's the light," broke out Ans' with considerable animation; "Flaxen 's got supper all ready for us. She 's a regular little Trojan,

that girl is. They ain't many girls o' fourteen that 'u'd stay there contented all day alone an' keep all the whole business in apple-pie order. She 'll get her pay some day."

"We 'll try to pay her; but say, ol' man, ain't it about time to open up our plans to her?"

"Wal, yes; it is. You kind o' start the thing to-night, an' we 'll have it over with."

As they drove up, Flaxen came to the door. "Hello, boys! What makes ye so late?"

"Finishin' up a field, babe. All done."

"Goody! all done at last. Well, yank them horses out o' their harnesses an' come to biscuits. They 're jest sizzlin' hot."

"All right. We 'll be there in about two jerks of a lamb's tail in fly-time. Bert, grab a tug; I 'm hungry as a wolf."

It was about the first of September, and the nights were getting cool, and the steaming supper seemed like a feast to the chilled and stiffened men coming in a little later and sitting down with the sound of the girl's cheery voice in their ears. The tea was hot; so were the biscuits. The pyramid of hot mashed potato had a lump of half-melted butter in the hollow top, and there were canned peaches and canned salmon.

"Yes; we 're about finished up harvestin'," said Bert, as they settled themselves at the table, "an' it 's about time to talk about gittin' you off to school."

"Don't worry about that. It ain't no great job, I reckon. I can git ready in about seventeen jiffies, stop-watch time."

"Not if you are goin' away off to some city in the East—"

"Yes; but I ain't, ye see."

"Oh, yes, you are. Bert an' I 've be'n talkin' it all over fer the last three weeks. We 're goin' to send you back to St. Peter to the seminary."

"I guess not, pap. I 'd like to know what you think you 're a-doin' sendin' me 'way back there. Boomtown 's good enough fer me."

"There, there, Flaxie; don't git mad. Ye see, we think they ain't anythin' good enough fer you. Nothin' too good for a girl that stays to home an' cooks for two old cusses—"

"You ain't cusses! You 're jest as good as you can be; but I ain't a-goin'—there!"

"Why not?"

"'Cause I ain't; that 's why."

"Why, don't ye wan' to go back there where the people have nice houses, an' where they 's a good—"

"Well, I don't know enough; that 's why. I ain't goin' back to no seminary to be laughed at 'cause I don't know beans."

"But you do," laughed Bert, with an attempt to lighten the gloom—"at least canned."

"They 'd laff at me, I know, an' call me a Norwegian."

"I 'll bet they won't, not when they see our new dress an' our new gold watch—dress jest the color o' crow's-foot grass, watch thirty carats fine. I 'd laugh to see 'em callin' my babe names then!"

And so by bribing, coaxing, and lying they finally obtained her tearful consent. They might not have succeeded even then had it not been for a young lady in Boomtown who was going back to the same school, and who offered to take her in charge. But there was hardly a day that she did not fling herself down into a chair and cry out:

"I jest ain't goin'. I 'm all right here, an' I don't see why you can't let me stay here. I ain't made no fuss. Seems as if you thought it was fun fer me to go 'way off there where I don't know anythin', an' where I don't know anybody."

But, having come to a conclusion, the men were relentless. They hired sewing-girls, and skirmished back and forth between Boomtown and the farm like mad. Their steady zeal made up for her moody and fitful enthusiasm. However, she grew more resigned to the idea as the days wore on toward the departure, though her fits of dark and unusual musing were alarming to Anson, who feared a desperate retreat at the last moment.

He took her over to see Miss Holt one day, but not before he had prepared the way.

"I s'pose things are in purty good shape around this seminary?" he asked.

"Oh, yes, indeed. There are three large buildings; libraries, picture-galleries, and music-rooms. The boarding-halls are carpeted, and the parlors are really elegant."

"Uh-hum!" commented Anson. "Well, now, I 'm goin' to bring my girl over to see you, an' I guess it 'u'd be jest as well if ye did n't mention these fineries an' things. Ye see, she 's afraid of all such things. It 'u'd be better to tell her that things were n't very gorgeous there, about like the graded school in Boomtown, say. She ain't used to these music-halls an' things. Kind o' make her think St. Peter ain't no great shakes, anyhow."

"I see," laughed the quick-witted girl. And she succeeded in allaying a good deal of Flaxen's dread of the seminary.

"Wal, babe, to-morrow," said Anson, as they were eating supper, and he was astonished to see her break out in weeping.

"Why don't you keep harpin' away on that the whole while?" she exclaimed. "Can't you leave me alone a minute? Seems to me you 're jest crazy to git rid o' me."

"Oh, we are," put in Bert. "We 're jest lickin' our chops to git back to sour flapjacks

an' soggy bread. Jest seems as though we could n't wait till to-morrow noon."

This cleared the air a little, and they spent the rest of the evening without saying much directly upon the departure.

"Come, come, brace up, babe! Anybody 'u'd think we 'd lost all the rest of our family, when we 're only doin' the square thing by our daughter. That 's all. Why, you 'll be as happy as a canary in less 'n two weeks. Young folks is about the same everywhere, an' you 'll git acquainted in less 'n two jiffies."

They were on the road to Boomtown to put Flaxen on the train. It was about the tenth of September, early in the cold, crisp air of a perfect morning. In the south there was a vast phantom lake, with duplicate cities here and there along the winding shores which stretched from east to west. The grain-stacks stood around so thickly that they seemed like walls of a great, low-built town, the mirage bringing into vision countless hundreds of them commonly below the horizon.

The smoke of steam threshing-machines mounted into the still air here and there, and hung long in a slowly drifting cloud above the land. The prairie-lark, the last of the singing birds, whistled softly and infrequently from the dry grass.

They were driving her to Boomtown to avoid the inquisitive eyes of the good people of Belleplain. "I may break down an' blubber," said Anson to himself; "an' if I do, I don't want them cussed idiots standin' around laughin'—it 's better to go on the C. B. and Q., anyhow."

Notwithstanding his struggle to keep talk going, Anson was unsuccessful from the very moment that Belleplain faded to an unsubstantial group of shadows, and disappeared from the level plain into the air, just as Boomtown correspondingly wavered into sight ahead. Silence so profound was a restraint on them all, and poor Flaxen with wide eyes looked wistfully on the plain that stretched away into unknown regions. She was thinking of her poor mother, whom she dimly remembered in the horror of that first winter. Naturally of a gay, buoyant disposition, she had not dwelt much upon her future or her past; but now that the familiar plain seemed slipping from her sight entirely, she was conscious of its beauty, and, rapt with the associated emotions which came crowding upon her, she felt as though she were leaving the tried and true for the unknown and uncertain.

"Boys," she said finally, "d' ye s'pose I 've got any folks?"

"I should n't wonder if ye had, babe, somewhere back in the ol' country."

"They could n't talk with me if I could find 'em, could they?"

"I reckon not, 'less you study so hard that you can learn their lingo," said Ans', seeing another opportunity to add a reason for going.

"Well, boys, that 's what I 'm goin' to do, an' by an' by we 'll go over there an' see if we can't find 'em, won't we?"

"That 's the talk; now you 're gittin' down to business," rejoined Ans'.

"I s'pose St. Peter is a good 'eal bigger 'n Boomtown," she said sighfully, as they neared the "emporium of the sleepy James."

"A little," said the astute Gearheart.

The clanging of the engines and the noise of shouting gave her a sinking sensation in the chest, and she clung to Anson's arm as they drove past the engine. She was deafened by the hiss of the escaping steam of the monster standing motionless, headed toward the east, ready to leap on its sounding way.

On the platform they found Miss Holt and a number of other friends waiting. There was a great deal of clanging, and whanging, and scuffling, it seemed to the poor overwrought girl. Miss Holt took her in charge at once and tried to keep her cheerful. When they had checked her trunk and the train was about ready to start, Ans' looked uneasy and fidgeted about. Bert looked on, silent and dark. Flaxen, with her new long dress and new bonnet, looked quite the woman, and Miss Holt greeted her as such; indeed, she kept so close to her that Anson looked in vain for a chance to say something more which was on his mind. Finally, as the train was about going, he said hesitatingly:

"Elga, jest a minute." She stared for a moment, then came up to him.

"I did n't want to call ye Flaxen afore her," he explained; "but ye—ain't—kissed us good-by."

The tears were streaming down her white cheeks, and this was too much. She flung her arms about his neck, and sobbed on his bosom with the abandon of girlish grief.

"I don't wan' to go at all, pap."

"Oh, yes, ye do, Elga; yes, ye do! Don't mind us; we 'll be all right. I 'll have Bert writin' a full half the time. There, kiss me good-by, an' git on—an' Bert here, too."

She kissed him twice through his bristling mustache, and, going to Bert, offered her lips, and then came back to Anson and threw herself again into his arms. She had no one to love but these two. Anson took her on his firm arm, and helped her on the car, and followed her till she was seated beside Miss Holt.

"Don't cry, babe; you 'll make ol' pap feel turrible. He 'll break right down here afore all these people, an' blubber, if ye don't cheer up. Why, you 'll soon be as happy as a fly in soup. Good-by, good-by!"

The train started, and Anson, brushing his

eyes with his great brown hand, swung himself off and stood looking at her. As the train passed him she rushed to the rear end of the car, and remained there looking back at the little station till the sympathetic Miss Holt gently led her back to her seat. Then she flattened her round cheek against the pane and tried to see Anson. When the last house of the town passed by her window she sank back in her seat and sobbed silently.

"I feel as if I 'd be'n attendin' my own funeral," said Anson, after they had got into their wagon and the train had gone out of sight in the haze of the prairie.

"Well, it 's pretty tough on that child to go off that way. To her the world is all a great mystery. When you an' I go to heaven it won't be any greater change fer us than this change fer Flaxen—every face strange, every spot new."

"Wal, she ain't so far away but we can look out fer her. She ain't poor ner fatherless as long as we live, hey?"

And then silence fell on them. As they were jogging homeward they saw the gray gulls rise from the sod and go home to the lake for the night. They heard the crickets' evening chorus broaden and deepen to an endless and monotonous symphony, as behind fantastic, thin, and rainless clouds the sun sank in unspeakable glory of color. The air, perfectly still, was cool almost to frostiness, and, far above, the fair stars broke from the lilac and gold of the sun-flushed sky. Lights in the farm-houses began to appear.

Once or twice Anson said: "She 's about at Summit now. Now she 's goin' down the Minnesota slope. I hope she 's chirked up."

They met threshing-crews going noisily home to supper. Once they met an "outfit," engine, tank, separator, all moving along like a train of cars, while every few minutes the red light from the furnace gleamed on the man who was stuffing the straw into the furnace door, bringing out his face so plainly that they knew it. As the night grew deeper an occasional owl flapped across the fields in search of mice.

"We 're bound to miss her like thunder, Bert; no two ways about that. Can't help but miss her on the cookin', hey?"

Bert nodded without looking up. As they came in sight of home at last, and saw the house silhouetted against the faintly yellow sky, Ans' said with a sigh:

"No light er singin' there to-night."

"The fact is, Flaxen has sp'iled us," laughed Anson, a couple of days later, when Bert was "cussin'" the soggy biscuit. "We 've got so high-toned that we can't stand common cookin'. Time was we 'd 'a' thought ourselves lucky to git as good as that. Rec'lect them flapjacks

we ust to make? By mighty! ye could shoe a horse with 'em. Say, I wish I could jest slip in an' see what she's a-doin' about now, hey?"

"She's probably writin' a letter. She won't do much of anythin' else fer a week."

"I hope you're right," said Anson.

They got a queer little letter every Wednesday, each one for several weeks pitifully like the others.

Dear boys I thought i would take my pen in hand to tell you i dont like it one bit the school is just as mene as it can be the girls do laugh at me they call me toe-head. if i catch em right i will fix their heads They is one girl who i like she is from pipestone she dont know no moren i do she says my dress is pritty is ol nig an the drake all rite i wish i was home.

ELGA.

The wish to be home was in all these letters like a sob. The men read them over carefully and gravely, and finally Anson would put them away in the Bible, bought on Flaxen's account, for safe-keeping.

As the letters improved in form their exultation increased.

"Say, Bert, don't you notice she writes better now? She makes big I's now in place o' little ones. Seems's if she runs the sentence all together, though."

"She'll come out all right. You see, she goes into the preparatory department, where they teach writin' an' spellin'. You'll see her hand improve right along now."

And it did, and she ceased to wail for home and ceased to say that she hated her studies.

"I am getting along splendid," she wrote some weeks after this. "I like my teacher; her name is Holt. She is just as nice as she can be. She is cousin to the one who came with me; I live with her uncle, and I can go to so-shibles whenever I want to; but the other girls cant. I am feeling pretty good, but I wish you boys was here."

She did not wish to be at home this time!

Winter shut down on the broad plain again with that implacable, remorseless brilliancy of fierce cold which characterizes the northern plain, stopping work on the farm and bolting all doors. Hardly a day that the sun did not shine; but the light was hard, white, glittering, and cold, the winds treacherous, the snow wild and restless. There was now comparatively little danger of being lost even in the fiercest storms, but still life in one of these little cabins had an isolation almost as terrible as that of a ship wedged amid the ice-floes of the polar regions.

Day after day rising to feed the cattle, night after night bending over the sooty stove listening to the ceaseless voice of the wind as it beat and brushed, whispered, moaned, and piped

or screamed around the windows and eaves—this was their life, varied with an occasional visit to the store or the post-office, or by the call of a neighbor. It is easy to conceive that Flaxen's bright letters were like bursts of bird-song in their loneliness. Many of the young men, their neighbors, went back East to spend the winter—back to Michigan, Iowa, New York, or elsewhere.

"Ans', why don't you go back an' visit yer folks?" asked Bert, one day. "I'll take care o' things."

"Wal, the fact is, I've be'n away so long they don't care whether I'm alive er dead. I ain't got no near relatives except a sister, an' she's got all the fam'ly she can 'tend to."

"Same here. We ain't very affectionate, anyway; our fam'ly and I don't write. Still I'd like to go back, jest to see how they all are."

"Why not go?"

"Well, I don't know. I guess I must one o' these days. I've kind o' be'n waitin' till we got into a little better shape. I hate to go back poor."

"So do I. It's hard work fer me to give up beat; I ain't goin' to do it yet awhile."

Sometimes a neighbor dropped in during the middle of the day, and on pleasant days they would harness up the team and take a drive down to the store and the post-office; but usually they just vegetated like a couple of huge potatoes in a cellar, as did most of the settlers.

It was the worst winter since the first that they had spent in the country. The snow seemed never still. It slid, streamed, rose in the air ceaselessly; it covered the hay, drifted up the barn door, swept the fields bare, and, carrying the dirt of the plowed fields with it, built huge black drifts wherever there was a wind-break, corn-field, or other obstruction.

There were moments when Bert was well-nigh desperate. Only contact with hard work and cold winds saved him. He was naturally a more ambitious, more austere man than Anson. He was not content to vegetate, but longed to escape.

It was in December that the letter first came from Flaxen which mentioned Will Kendall.

O boys! I had the best time. We had a party at our house and lots of boys came and girls too, and they were nice, the boys, I mean. Will Kendall he is the nicest feller you ever seen. He has got black eyes and brown hair and a gold watch-chain with a locket with some girl's hair in it, and he said it was his sister's hair, but I told him I did n't believe it, do you? We had cake and popcorn and 'lasses candy; and Will he took me out to supper.

Bert was reading the letter, and at this point he stopped and raised his eyes, and the two men

gazed at each other without a word for a long time. Then Anson laughed.

"She's gittin' over her homesickness. She's all right now she's got out to a sociable."

After that there was hardly a letter that did not mention Kendall in some innocent fashion among the other boys and girls who took part in the sleigh-rides, parties, and sociables. But the morbidly acute Bert, if he saw, said nothing, and Anson did not see.

"Who d' ye s'pose this Kendall is?" asked Anson, one night late in the winter, of Gearheart, who was reading the paper while his companion reread a letter from Flaxen. "Seems to me she's writin' a good 'eal about him lately."

"Oh, some slick little dry-goods clerk or druggist," said Bert, with unwarrantable irritation.

"She seems to have a good 'eal to say about him, anyway," repeated Anson, in a meditative way.

"Oh, that's natural enough. They are two young folks together," replied Bert, with a careless accent, to remove any suspicion which his hasty utterance might have raised in Anson's mind.

"Wal, I guess you're right," argued Anson, after a pause, relieved. This relief was made complete when in other letters which came she said less and less about Kendall. If they had been more experienced, they would have been disturbed by this suspicious fact.

Then again, when Anson wrote asking "What has become of that Kendall you wrote so much about?" she replied that he was there, and began writing of him again in a careless sort of way, with the craft of woman already manifest in the change of front.

Spring came again, and that ever-recurring miracle, the good green grass, sprang forth from its covering of ice and snow, up from its hiding-place in the dark, cold sod.

Again the two set to work ferociously at the seeding. Up early in the wide, sweet dawn, toiling through the day behind harrow and seeder, coming in at noon to a poor and badly cooked meal, hurrying back to the field and working till night, coming in at sundown so tired that one leg could hardly be dragged by the other — this was their daily life.

One day, as they were eating their supper of sour bread and canned beans, Gearheart irritatedly broke out: "Ans', why don't you git married? It 'u'd simplify matters a good 'eal if you should. 'Old Russ' is no good."

"What's the matter with *your* gittin' married?" replied Anson, imperturbably pinching off the cooked part of the loaf, skilfully leaving the doughy part.

"I ain't on the marry; that's all."

"Neither 'm I."

VOL. XLIII.—117.

"Well, you ought to be."

"Don't see it."

"Well, now, let me show it. We can't go on this way. I 'm gittin' so poor you can count my ribs through my shirt. Jest think how comfortable it would make things. No more awful coffee; no more canned baked beans; no more cussed, infernal, everlastin', leathery flapjacks; no more soggy bread — confound it!" Here he seized the round inner part of the loaf, from which the crust had been flaked, and flung it through the open door far down toward the garden.

"Bert! that's the last bit of bread we've got in the house."

"What's the odds? We could n't eat it."

"We could 'a' baked it over."

"We *could* eat dog, but we don't," replied Bert, gloomily. His temper was getting frightful of late.

"We 'll be all right when Flaxen comes back," said Ans', laughing.

"Say, now, you've said that a thousand times this winter. You know well enough Flaxen's out o' this. We ain't countin' on her," blurted Gearheart, just in the mood to say disagreeable things.

"Wha' d' ye mean? Ain't she comin' back in June?"

"Probably; but she won't stay."

"No; that's so. She 'll have to go back in September; but that's three months, an' we may sell out by that time if we have a good crop. Anyway, we 'll live high fer a spell. We ought to have a letter from her to-night, had n't we?"

"I 'm goin' down to see, if you 'll wash the dishes."

"All right. Take a horse."

"No; the horses are tired. I 'll foot it."

"Wal, ain't you too?"

"Want anythin' from the store?"

"Yes; git a hunk o' bacon, an' some canned corn, tomatoes, an' some canned salmon; if ye think we can stand the pressure, bring home a can o' peaches."

And so Gearheart started off for town in the dusk, afoot, in order to spare the horse, as though he had not himself walked all day long in the soft, muddy ground. The wind was soft and moist, and the light of the stars coming out in the east fell upon his upturned eyes with unspeakable majesty. Yet he saw them but dimly. He was dreaming of a face which was often in his mind now — a face not unlike Flaxen's, only older, more glorified, more womanly. He was asking himself some searching questions to-night as his tired limbs dragged themselves over the grassy road.

What was he toiling for, anyway? What mattered all this terrible tramping to and fro — was it an end or only a means? Would there

ever come anything like satisfaction of desire? Life for him had been a silent, gloomy, and almost purposeless struggle. He had not looked forward to anything very definite, though vaguely he had hoped for something better.

As his eyes fell upon the twinkling yellow lights of the village his thought came back to Flaxen and to the letter which he expected to receive from her. He quickened his steps, though his feet were sore and his limbs stiff and lame.

The one little street presented its usual Saturday-night appearance. Teams were hitched to the narrow plank walk before the battlemented wooden stores. Men stood here and there in listless knots, smoking, talking of the weather and of seeding, while their wives, surrounded by shy children, traded within. Being Saturday night, the saloons were full of men, and shouts and the clink of beer-mugs could be heard at intervals. But the larger crowd was gathered at the post-office: uncouth farmers of all nationalities, clerks, land-sharks, lawyers, and giggling girls in couples, who took delight in mingling with the crowd.

Judge Sid Balser was over from Boomtown, and was talking expansively to a crowd of "leading citizens" about a scheme to establish a horse-car line between Boomtown and Belleplain. Colonel Arran of the Belleplain "Argus," in another corner, not ten feet away, was saying that the Judge was "a scoundrel, a blow-hard, and would down his best lover for a pewter cent," to all of which the placid Judge was accustomed and gave no heed.

Bert paid no attention to the colonel or to the judge, or to any of this buzzing. They were just talking to hear themselves make a noise, anyway. "They talk about building up the country—they who are a rope and a grindstone around the necks of the rest of us who do the work."

When Gearheart reached his box he found a large square letter in it, and, looking at it, saw that it was from Flaxen directed to Anson. "Her picture, probably," he said as he held it up. As he was pushing rapidly out he heard a half-drunken fellow say, in what he thought was an inaudible tone:

"There 's Gearheart; wonder what 's become of his little Norsk."

Gearheart turned and, pushing through the crowd, thrust his eyes into the face of the speaker with a glare that paralyzed the poor fool.

"What's become o' your sense?" he snarled in a frightfully wolfish tone, which had in it a carnivorous note.

With this warning he turned contemptuously, and passed out, leaving the discomfited rowdy to settle accounts with his friends. But there

was a low note in the ruffian's voice, an insinuating inflection, which stayed with him all along the way home, like a bad taste in the mouth. He saw by the aid of a number of these sidelights of late that Flaxen never could come back to them in the old relation; but how could she come back?

Gearheart stopped and gazed thoughtfully upward. She must come back as the wife of Ans' or himself. "Pooh! she is only a child," he said, snapping his finger, and walking on. But the insistence remained. "She is not a child, she is a maiden soon to be a woman; she has no relatives, no home to go to but ours after her two or three years of schooling are over; it must still be her home, and no breath of scandal shall touch her if I can prevent it; and after her two years are up"—after a long motionless reverie he strode forward—"she shall choose between us."

There had grown up between the two friends of late a constraint, or, to be more exact, Gearheart had held himself in before his friend, had not discussed these problems with him at all. "Ans' is just like a boy," he had said to himself; "he don't seem to understand the case, and I don't know as it's my duty to enlighten him; he either feels very sure about her, or he has not understood the situation."

He was thinking this now as he strode across the spongy sod toward the lighted windows of the shanty. The air was damp and chill, for the ice was not yet out of the ponds or swamps of tall grasses. An occasional prairie-cock sent forth a muffled, drowsy "boom"; low-hung flights of geese, gabbling anxiously, or the less orderly ducks, with hissing wings, swept by overhead, darkly limned against the stars. There was a strange charm in the raw air, so laden with the fresh, subtle, all-pervasive scent of springtime earth. The weary man almost forgot his pain as he drew deep breathings of the night.

It was significant of the restraint that had grown up between him and Anson that he held the letter from Flaxen unopened in his hand simply because it was directed to his friend. He knew that it was as much to him as to Anson, and yet, feeling as he had of late, he would not open it, for he would have been angry if Anson had opened one directed to him. He simply judged Anson by himself.

The giant was asleep when he entered. His great shaggy head lay beside the lamp on his crossed arms. Bert laid the letter down beside him, and shook him.

"Hello! got back, hey?" the sleeper said, rousing up sluggishly. "Anythin'?" Then he caught sight of the letter. "Oh, bless her little heart! wonder what it is? Pecture, bet my hat!" Here he opened it.

"Gee-whittiker, thunder and turf, gosh all — Friday — Look-a there! Ain't she growed!" he yelled, holding the picture by the corner and moving it into all sorts of positions. "That 's my little girl, our Flaxen; she can't grow so purty but what I 'd know her. See that hair done up on the top of her head! Look at that dress, an' the thingumajigs around her neck! Oh, she 's gittin' there, Smith, hey?"

"She 's changin' pretty fast," said Bert, listlessly.

"Changin' fast! Say, ol' man, what 's the matter with ye? Are ye sick?"

"I 'm played out, that 's all."

"Darn my skin! I should think ye would be, draggin' all day, an' then walkin' all o' four mile to the post-office. Jest lay down on the bed there, ol' boy, while I read the letter to ye. Say, ol' man, don't you git up in the mornin' till you please. I 'll look after the breakfast," insisted Anson, struck with remorse by the expression on Bert's face.

"But here 's the letter. Short an' sweet."

DEAR BOYS [Bless the little fist that wrote that!]: I send my picture. I think it is a nice

(To be concluded in the next number.)

one. The girls say it flatters me, but Will says it don't [What the devil do we care what Will says?] — I guess it does, don't you? I wish I had a picture of you both; I want to show the girls how handsome you are [She means me, of course, said Ans'. No, confound it; how handsome you are] both of you. I wish you would send me your pictures both of you. I ain't got much to say. I will write again soon.

ELGA.

Bert looked at the picture over Anson's shoulder, but did not seem to pay much attention to it.

"Wal, I 'll go out an' shut the barn door. Nights git cold after the sun goes down. You need n't peel the 'taters to-night. We 'll bake 'em, brussels an' all, to-morrow mornin'."

When Anson had gone, Bert snatched up the picture with great eagerness, and gazed upon it with a steady, devouring glance. How womanly she looked with her hair done up so, and the broad fair face and full bosom.

He heard Anson returning from the barn, and hastily laid the picture down, and when Anson entered was apparently dropping off to sleep.

Hamlin Garland.

WOLCOTT BALESTIER.

T was about three years ago — it was early in 1889 — that, on an evening which must always remain memorable to some of us, two or three English writers met, at the house of Mrs. Humphry Ward, a young

American man of business who had just made her acquaintance. Among those who then saw Mr. Wolcott Balestier for the first time were Mr. Henry James (soon to become his closest and most valued friend in England) and the writer of these lines. As I look back upon that evening, and ask myself what it was in the eager face I watched across the table-cloth which could create so instant a thrill of attraction, so unresisted a prescience of an intimate friendship ready to invade me, I can hardly find an answer. The type was not of that warm and sympathetic class so familiar in our race; neither in color, form, nor character was it English. In later moments one analyzed that type — a mixture of the suave colonial French and the strained, nervous New England blood. But, at first sight, a newly presented acquaintance

gained an impression of Mr. Balestier as a carefully dressed young-old man or elderly youth, clean-shaven, with smooth dark hair, thin nose, large, sensitive ears, and whimsically mobile mouth. The singular points in this general appearance, however, were given by the extreme pallor of the complexion, and by the fire in the deeply set dark-blue eyes. For the rest, a spare and stooping figure, atonic, ungraceful, a general physique absurdly and even exasperatingly ill-matched with the vigor of will, the extreme rapidity of graceful mental motion, the Protean variety and charm of intellectual vitality, that inhabited this frail bodily dwelling. To the very last, after seeing him almost daily for nearly three years, I never could entirely lose the sense of the capricious contrast between this wonderful intelligence and the unhelpful frame that did it so much wrong.

Charles Wolcott Balestier had just entered his twenty-eighth year when first I knew him. He was born at Rochester, New York, on the 13th of December, 1861. His paternal great-grandfather had been a French planter in the island of Martinique; his maternal grandfather, whom he is said to have physically resembled, was a jurist who completed commercial negotiations between the United States and Japan.

Of his early life I know but little; Mr. Henry James, when he undertakes the task of biography, will doubtless tell us so much as it is interesting to preserve of all this. Wolcott Balestier was at school in his native city, and at college for a short time at Cornell University, but his education was, I suppose, mainly that of life itself. After his boyhood he spent a few years on the outskirts of literature. I learn from Mr. W. D. Howells that at the age of seventeen he began to send little tales and essays to the office of the "Atlantic Monthly." He edited a newspaper, later on, in Rochester; he published in succession three short novels; and he was employed in the Astor Library in New York.

All these incidents, however, have little significance. But in the winter of 1882 he made an excursion to Leadville, which profoundly impressed his imagination. The Colorado air was more than his weak chest could endure, and he soon came back; but two years later he made a second trip to the West, in company with his elder sister, and this lasted for many months. He returned, at length, through Mexico and the Southern States. The glimpses that he gained in 1885 of the strange life of the West remained to the end of his career the most vivid and exciting which his memory retained. The desire to write earnestly seized him, and it was in Colorado that the first crude sketch of the book afterward rewritten as "Benefits Forgot" was composed. Soon after his return to New York he became known to and highly appreciated by Mr. John W. Lovell, and in the winter of 1888 he came over to England to represent that publisher, and to open an office in London.

Of his three full years in this latter city I can speak with some authority, for I was in close relation with him during the greater part of that time. He arrived in England without possessing the acquaintance of a single Englishman; and he died leaving behind him a wider circle of literary friends than, probably, any living American possesses. He had an ardent desire to form personal connections with those whose writings in any way interested him,—to have his finger, as he said, on the pulse of literature,—and the peculiarity of his position in London, as the representative of an American publishing-house, not merely facilitated the carrying out of this ambition, but turned that pleasure into a duty. He possessed a singularly winning mode of address with strangers whose attention he wished to gain. It might be described as combining the extreme of sympathetic resignation with the self-respect needful to make that resignation valuable. It was in the nature of the business in which Mr. Balestier was occupied during his stay in England

that novels (prose fiction in all its forms) should take up most of his thoughts. I suppose that there was not one English novelist, from Mr. George Meredith and Mr. Thomas Hardy down to the most obscure and "subterranean" writer of popular tales, with whom he did not come into relations of one sort or another, but sympathetic and courteous in every case. He was able to preserve in a very remarkable degree his fine native taste in literature, while conscientiously and eagerly "trading" for his friends in New York in literary goods which were not literature at all. This balance of his mind constantly amazed me. His lofty standard of literary merit was never lowered; it grew, if anything, more exacting; yet no touch of priggishness, of disdain, colored his intercourse with those who produce what the public buys in defiance of taste, the honest purveyors of deciduous fiction.

Mr. Balestier's ambition on landing, an obscure youth, in an England which had never heard of him was no less than to conquer a place of influence in the center of English literary society. Within three years he had positively succeeded in gaining such a position, and was daily strengthening it. There has been no such recent invasion of London; he was not merely, as we used to tell him, "one of our conquerors," but the most successful of them all.

What was so novel and so delightful in his relations with authors was the exquisite adroitness with which he made his approaches. He never lost a shy conquest through awkwardness or roughness. If an anthology of appreciations of Wolcott Balestier could be formed, it would show that to each literary man and woman whom he visited he displayed a tincture of his or her own native color. As I write these words a letter comes from the author of "John Inglesant," to whom in the winter of 1890 I gave Balestier a letter of introduction. "The impression he left upon me," says Mr. Shorthouse, "was so refined and delicate in its charm that I looked back to it all through that terrible winter with a bright recollection of what is to me the most delightful of experiences, a quiet dinner with a sympathetic and intelligent man."

Our notices of the dead tend to grow stereotyped and featureless. We attribute to them all the virtues, all the talents, but shrink from the task of discrimination. But the sketch which should dwell on Wolcott Balestier mainly as on an amiable young novelist cut off in the flower of his literary youth would fail more notably than usual in giving an impression of the man. Of his literary work I shall presently speak: to praise it with exaggeration would, as I shall try to show, be unwise. But all men are not mere machines for writing books, and Balestier,

preëminently, was not. The character was far more unique, more curious, than the mere talent for composition, and what the character was I must now try to describe. He had, in the first place, a business 'capacity which in its degree may not be very rare, if we regard the whole industrial field, but which as directed to the profession of publication was, I am not afraid to say, unique. He glanced over the field of the publishing-houses, and saw them all divided in interests, pulling various ways, impeding one another, sacrificing the author to their traditions and their lack of enterprise. He dreamed great dreams of consolidation, at which those who are incapable of the effort of dreaming may now smile, if they will. But no one who is acquainted with details to which I must not do more than allude here will deny that he possessed many of the characteristics needed to turn his dreams into facts. He held in his grasp the details of the trade, yet combined with them an astonishing power of generalization. I have never known any one connected with the art or trade of literature who had anything like his power of marshaling before his memory, in due order, all the militant English writers of the moment, small as well as great. There they stood in seemly rows, the names that every Englishman honors and never buys, the names that every Englishman buys and never honors. Balestier knew them all, knew their current value, appraised them for future quotation, keeping his own critical judgment, all the while, unbent, but steadily suspended.

To reach this condition of experience time, of course, had been required, but really very little. Within twelve months he knew the English book-market as, probably, no Englishman knew it. Into this business of his he threw an indomitable will, infinite patience, a curious hunting or sporting zest, and what may be called the industrial imagination. His mind moved with extreme rapidity; he never seemed to require to be told a fact or given a hint twice. When you saw him a few days later, the fact had gathered to itself a cluster of associate supports, the hint had already ripened to action. I may quote an instance which has a pathetic interest now. In the autumn of 1889, fresh from reading "Soldiers Three," I told him that he ought to keep his eye on a new Indian writer, Rudyard Kipling. "Rudyard Kipling?" he answered impatiently; "is it a man or a woman? What's its real name?" A little nettled, I said: "You will find that you won't be allowed to go on asking questions like those. He is going to be one of the greatest writers of the day." "Pooh, pooh!" Balestier replied; "now you are shouting!" And no further reference was made to the subject. But three days later I found a pile of the blue

Indian pamphlets on his desk, and within a week he had added the future collaborator in "The Naulahka" to the troop of what he used to call his "personal conquests."

No striking qualities, as we know, are without their defects. The most trying peculiarity of Wolcott Balestier was the result of his rapidity in decisive manœuvering. He had cultivated such a perfect gift for being all things to all men, discretion and tact were so requisite in his calling, that he fell, and that increasingly, into the error of excessive reticence. This mysterious secrecy, which grew on him toward the last, his profound caution and subtlety, would doubtless have become modified; this feature of his character needed but to become a little exaggerated, and he would himself have perceived and corrected it. There was perhaps a little temptation to vanity in the case of a young man possessed of so many secrets, and convinced of his worth as a confidential adviser. He "had the unfortunate habit of staring very hard at his own actions, and when he found his relations to others refining themselves under a calcium light, he endeavored to put up the screen." These words from a story of his own may be twisted into an application that he never intended. In the light of his absolute and unshaken discretion, of his ardent loyalty to his particular friends, of his zeal for the welfare of others, this little tortuous foible for mystery dwindles into something almost too small to be recorded.

For the ordinary relaxations of mankind, especially for the barbarous entertainments of us red-blooded islanders, he had an amused and tolerant disdain. He rode a little, but he had no care for any other sort of exercise. He played no games, he followed no species of sport. His whole soul burned in his enterprises, in his vast industrial dreams. If he tried golf, it was because he was fond of Mr. Norris; if he discussed agriculture and Wessex, it was because that was the way to the heart of Mr. Thomas Hardy. Nothing came amiss to him in conversation, and he was so apt a learner that he would talk charmingly of politics, of wine, of history, even of the fine arts. But only three things really occupied his mind — the picturesque procession of the democratic life of to-day, the features and fortunes of his friends, and those commercial adventures for the conduct of which he had so extraordinary a genius.

It is by design that I have not spoken hitherto of his own literary productions. It would be easier, I think, to exaggerate their positive value than to overrate the value of the man who wrote them. Moreover, there is a certain impropriety in publicly analyzing what has not yet been given to the public. The three novels which he published in America ("A Patent

Philtre," 1884; "A Fair Device," 1884; "A Victorious Defeat," 1886) were the outcome of an admiration for the later novels of Mr. W. D. Howells, but they had not the merit even of being good imitations. He was conscious of their weakness, and he deliberately set himself to forget them. Meanwhile the large issues of life in the West and its social peculiarities fascinated him. The result of his study of the Leadville of 1885 will be found in a novel called "Benefits Forgot," which was finished in 1890, and which will appear in these pages. During the last year of his life Wolcott Balestier took to composition again with much fervor and assiduity. There is no question that his intimate friendship with so eager and brilliant an artist as Mr. Rudyard Kipling was of vast service to him. The short stories of this last year are exceedingly remarkable. There remains the part of "The Naulahka" which he contributed, but on this it is impossible here to dwell. His posthumous writings will be presented in succession to the readers of *THE CENTURY MAGAZINE*, and when they have passed through this periodical form, they will fill two or three volumes. What he might have done, if he had lived ten years longer, none of us can conjecture.

The melancholy task remains to me of tell-

ing how so much light and fire was extinguished. He habitually overworked himself to such a degree, the visible mental strain was so obvious, that his health had long given us the deepest anxiety. I, for one, for a year had almost ceased to hope that he could survive. Yet it now appears, both from the record of his family and from the opinion of the German doctors, that there was no organic mischief, and that he might, in spite of his weakness, have lived to old age. He was overworked, but he never worried; he was exhausted, but he did not experience the curse of sleeplessness. Last November, however, after some days of indisposition, looking all the while extremely ill, he left us for business reasons, and went to Berlin. We heard of him a few days later as laid up in Dresden. His mother and sisters immediately went to him from Paris. The disease proved to be typhoid fever in a most malignant form, and on the twenty-first day, Sunday, the 6th of December, 1891, he died, having not quite completed his thirtieth year. He lies buried in the American cemetery at Dresden, and our anticipations lie with him;

For what was he? Some novel power
Sprang up for ever at a touch,
And hope could never hope too much
In watching him from hour to hour.

Edmund Gosse.

IN MEMORIAM WOLCOTT BALESTIER.

TEARS do but blind; our grief hath vision clear;
The shadows that now lower a little space,
And hide from us familiar form and face,
Will lift and lighten with each fleeting year,
And thou wilt seem not far, but very near,
Infolded ever in our love's embrace.
Still dost thou live, and in thy wonted place.
Thy realm is thought, and Death is powerless here;
Oft wilt thou greet us in the days to come,
The laurel's beauty gleaming on thy brow,
And soul to soul we shall commune with thee,
And thoughts for which even poesy is dumb
Shall find a voice, and we shall listen now
To genius touched by immortality.

James R. Campbell.

"STARVING AT TASKOMA!"

PICTURES BY HARPER PENNINGTON.

ENGRAVED BY F. W. SUTHERLAND.

HE winter that followed the cessation of work on the Taskoma branch of the Canadian Pacific Railway will long be remembered on the Madawaskan Bay. The contractors were bankrupt, and the last batches of unpaid workmen had to be released from their snow prison by relief-parties.

At that time the inhabitants of Taskoma Mills were warned of the danger they were running, and were advised to leave, but they had become attached to their new home, rough and isolated as it was. They believed in the development, and eventual prosperity of this jumping-off place, and attributed such depreciatory epithets as God-forsaken, blankety-blanked, etc.—without one of which the name of their settlement was rarely mentioned—to ill feeling caused by the collapse of the railroad enterprise. Like all fond parents they had a weakness for their offspring, and were equally sanguine in their expectations of future greatness.

When the winter closed around them with an unusual extravagance of cold and snow, they calked the seams of their log huts, worked at the woodpile, and patiently awaited the steamer that was to bring their supplies. The news of her wreck and total loss off Anatoulin Island was, to say the least, inopportune, and at the daily meeting in McSwine's quondam grocery and post-office the situation was briefly outlined by the president in the following terms:

MEN OF TASKOMA: As presiding officer of this and numerous other assemblies it becomes my painful duty to inform you that the *Albert Nyansa* has foundered with the captain and crew, our hopes and supplies. She's a total, absolute, complete wreck. And now, gentlemen, let us look at the situation like men, as we are. Our navy's no good, because we have n't any. Our telegraph system's no good, because the only wire is down. And our army's no good, because the Indians say we cannot travel at present. Offensively speaking, then, we're paralyzed. And right here I move

that our resolution to stay and face it out was unwise, unjustifiable, and un-sane. On that subject I will say more. I will say that it is our duty as a community to put it on record that every man present behaved at that time like an ass, a — ass, and nothing but an ass. And I also move, and second the motion, that a committee be appointed to break its way through to Yatchedash Junction, and petition for help. Contrary minded? The ayes have it; it is a vote. I therefore name and appoint Messrs. Collins, Fairbanks, and Fournier as voluntary members of that committee, and order them to start not later than four o'clock to-morrow morning.

The proceedings whereby this forlorn hope was authorized were therefore perfectly regular and correct. The "volunteers" left at the hour specified, and in the mean time the camp was organized on a starvation basis. All supplies were turned into headquarters at McSwine's, and every morning the daily ration was served out to the members of the community according to the president's handicap scale of appetites. However, when a few days later the relief-committee returned to camp in a starving condition, the inhabitants began to realize that the impending famine was more than a mere picturesque episode in the history of their development. Another expedition, better fitted out than the first, was at once sent out to break through the "Chinese Wall" of snow that surrounded Taskoma, and in the mean time the most strenuous efforts were made to increase the small stock of food on hand. Although fishing through the ice was warmly advocated at McSwine's, it was effectively discouraged at the other end of the line by the prospective victims. And day after day the men of the camp met around the stove at the grocery, to smoke, and to chew the bitter cud of reflection. The empty shelves around them expounded the philosophy of the situation in pathetic but convincing silence; and silence became the chief characteristic of the community.

The only man who stayed away from these meetings was the mission priest. In the rude, unpainted little chapel-house, on the lower floor of which he occupied a closet, Father Taché fasted and prayed, consoling the distressed women who came to him, and thus indirectly strengthening the men. When the ninth cheerless, leaden day dawned, and the snow continued falling, and yet no news came from the outside world, he arose from his morn-

ing prayers with the conviction that the temporal, as well as the spiritual, salvation of his flock rested entirely with him. For an hour or two he paced the parlor of the mission-house, considering the problem before him, and then ascended to the chapel to pray. While he was kneeling at the altar it seemed to him that the Madonna leaned forward out of her golden frame and whispered to him, "Go thou upon the path, for the Lord hath chosen thee!"

Father Taché was a man of simple character; faithful, honest, and passionately sincere in his vocation, a priest of medieval convictions and latter-day forbearance. That there existed good, strong men among the heretics he admitted, while he deplored the error of their belief. It was his duty to preach that there was no salvation outside of the Church, but he did so with a mental reservation; for the Church, as he conceived it, was bounded only by faith, hope, and charity, and all men who practised these virtues were, consciously or not, members of the great congregation. Still, with these broad-minded views he united certain curious, obsolete beliefs, as picturesque adornments of an otherwise simple and matter-of-fact character. When the first bad news had reached Taskoma, Father Taché concluded that the settlement was expiating the inevitable sins of its temporary prosperity; and now it was equally evident to him that God required a propitiatory sacrifice. He had been chosen, and from that moment forward he did not hesitate in the performance of his obvious duty. Toward evening he went down to McSwine's grocery and asked for the latest news.

"There ain't any, Father Taché," one of the men answered; "and savin' your pardon, short o' comin' from heaven, I don't see as any is likely to reach us for the present. If that party we sent out had got to Yatchedash, we 'd 'a' heard from 'em yesterday or the day before. So I guess they never got there, and that's the end of it. We're goin' to try once more, and Runnin' Joe here is goin' to make a break in the mornin'."

"The news *has* come from heaven!" the priest answered solemnly, stepping forward to the center of the room. "This day the Lord appeared to me in a vision, and said, 'Go thou forth upon the path!' And to-morrow morning I shall start alone."

There was something in Father Taché's voice and manner that impressed even the least superstitious, and for half a minute no one spoke. Then all together they protested against his going. The Irish and the French Canadians would not hear of his leaving them and their families when they most needed his spiritual help and consolation. The others objected for equally convincing reasons. Physically he was not strong enough; he was not

in proper training; he was no woodsman; he did not know the caches and water-holes, etc. But Father Taché stood his ground. To some he said: "It is the will of God. You cannot know it as I do." The others he reminded of his long service in tent and cabin on "construction" work. As for the road, he knew every inch of it; was he not the priest of this very district? But these reasons failed to satisfy them, and the discussion waxed hotter and more personal. "You are not strong enough, you are not strong enough," they kept repeating; until, brushing them all aside, he stood forth in the middle of the room.

"With the help of God, who is stronger than I!" he cried, stroking his short, black beard nervously. "Let him stand forth, and I will wrestle with him; and if I prevail, then I shall go to Yatchedash instead of Joe."

For the next few moments all was noise and confusion, and from all corners of the room came cries of "No! No! Yes! Yes! Never! We won't allow it. It is the only way! Let him do as he 's a mind to! It 's none of our business, anyway! Silence! Come, that 's fair! Stand back!" until McSwine loudly rapped for order. "Let Father Taché have his own way, boys, and stand back against the walls. It 's a perfectly square deal. If Joe can throw him, then Joe goes. If he can't, then he 'll have to stay along of us and see it out here."

While McSwine was speaking, Father Taché had bared his brawny arms; and as he stood there in relief, like an old-time champion of the Church, with the ends of his cassock tucked into his waistband, his massive shoulders thrown back, and the light of enthusiasm in his honest blue eyes, many a man present suddenly felt moved to bet his ration of canned beef against the Indian, in spite of the latter's well-known strength and skill.

When Joe, solidly confident in his huge proportions, signified that he was ready, the silence was so great that the splutter of the lamps was distinctly audible; the excitement so intense that for the first time in many days the presence of the grim sentinel outside was forgotten. Father Taché's inexperience was evident from the first. The Indian obtained such a hold that the contest seemed ended before it had fairly begun. But to the surprise of all the Father broke it slowly, steadily, and apparently without great effort. Regardless of rules, he closed his massive arms around his adversary, and held him as a bear hugs a man, swaying slowly from side to side. And to and fro, panting, they lurched, sank, fell, and rallied; resting for a moment, with short cries wrung from them by their exertions; and then again reeling and straining, breast to breast, backward and forward, now up to-

"AVE, DOMINE!"

gether, now on the ground, for the privilege of self-sacrifice on the morrow. More than once the cunning of the Indian nearly won the battle, and he grunted contentedly—but always too soon. For as it became evident that he was weakening, it became equally evident that Father Taché was gaining in strength and skill. His eyes shone with a fanatical fire; the spirit that animated the crusaders glowed, and burned, and seethed within him; the conviction that he was the champion of the Church grew stronger and more evident; in a frenzy of religious enthusiasm he suddenly raised the Indian high in the air, and, as he flung him to the floor, stunned and helpless, the building rang with his triumphant chant: "*Ave, Domine! fortissimi ecclesie filii!*"

At six the next morning the whole camp, men, women, and children, Catholics and heretics, attended early mass, and after the communion waited outside while Father Taché prayed alone at the altar for strength and endurance. Then they helped him to make his pack, and in a body accompanied him to the border of the forest. There many fell on their knees in the snow to receive his last blessing, and, one after another, those who had remained standing now uncovered, bent their heads, and finally kneeled also. And as he stood with outstretched hands and face upturned toward the sky, the pale win-

ter sun broke through the mist on the horizon and illumined his figure brightly. For a minute he stood silent, deeply moved, with suffused eyes that looked into the brightness beyond; and raising his voice, he unconsciously quoted the Scripture, saying: "Whither I go, ye know; and the way ye know. Let not your hearts be troubled. I will come again. I will not leave you comfortless; I will come to you." Then pulling on his tunique he turned to go.

It was an impressive moment in the history of the camp, and the most hardened felt moved. So, when old Tim Sawyer stretched out his stick toward the priest, and said in an uncertain voice, "God bless you, Father Taché!" every man in that crowd repeated after him, "God bless you, Father!"

For a while they stood watching the retreating figure as it grew smaller and smaller between the high, snow-plastered walls of the trees, until finally the black speck, with all their hopes and fears, disappeared behind a turn in the road. And one after another in silence returned to his dreary cabin.

FOR some hours after his departure Father Taché walked along unconscious of his surroundings. Had the magnitude, or the difficulty, or the probable failure of his undertaking suggested itself to his mind, he would have

swept it aside with a quotation or a prayer. That Yatchedash Junction was ninety miles away; that no human habitation was to be found along the road; that many of the trestles had been burned, and must therefore be crossed on a single line of rails hanging together only by the bolts of the fish-plates; that all the dangers of a long march alone through exceptionally heavy snow lay before him, weighed as nothing in the balance against the single fact

was a fine specimen of man; the kind of flesh and blood of which enthusiasm makes heroes and martyrs. While still a mere boy he had loved with all the earnest ardor of an honest heart; but death had vetoed the confirmation of his happiness, and grief had made of him a priest. The rigid scholastic training of the seminary, to which he had submitted absolutely,—for he was not a man to do anything in a half-hearted way,—had been unable to quench his healthy love for the beauties of nature, or to impair his quick sympathy with the prosperity or misery of his fellow-creatures. And so on this first day of his homeric struggle with the snow-king, Father Taché warmed with enthusiasm over the magnificence of the wild northern landscape, and glorified God for the marvels of his creation. As he marched along he sang in his powerful bass voice the old Canadian songs which he had learned as a boy, and whose every line or variation of tune he both knew and loved; and few would have supposed that this stalwart friar, singing and swinging his massive limbs to the cadence of the refrain,

En roulant ma boule, roulant !
En roulant ma boule !

was the emissary of a starving community cut off from all human aid, and whose existence depended upon his energy and endurance.

All that day lustily singing, he pushed onward, halting only for a short meal about noon-time. He hoped to reach the bridge over the Spanish River some time before dark, as the log huts built there a few months ago would afford him shelter overnight. It was a great journey to accomplish in one day, being somewhat over fifty miles of the ninety; but the weather was fair, and Father Taché believed that if he succeeded in reaching that point on the first day the happy issue of his expedition was assured. When the sun went down, or rather when the bright day waned to an arctic twilight, Father Taché's songs became more sentimental; his singing was less spontaneous, and lapsed gradually into a subdued humming that soon died out altogether. The silence, the semi-darkness, the appalling isolation, and the natural weariness resulting from such a colossal effort, began to tell upon his spirits, and little by little the dangerous snow-drowsiness, so fatal to many a traveler, insidiously worked its way into his brain. But as he felt it gaining upon him he struggled more determinedly with fatigue and sleep, cooled his forehead in the snow, and prayed, and stumbled on.

It was late indeed when he broke his way through into the old telegraph-office at the Spanish River; but the satisfaction of having accomplished so much made him forget his weariness, his suffering, and the uncertainty of

AT THE ALTAR.

that fifty families were starving at Taskoma. With the skirts of his cassock tucked into his belt, a blanket over his knapsack, with his ax and his missal, the sturdy Father sped along on his snow-shoes at a rapid gait. No snow had fallen since daylight. The broad swath cut for the railroad-track through the pine-forest, and evenly filled up with snow to half the height of the telegraph-poles, reached out before him, until afar off it climbed the horizon, narrow, evident, and steep, as he fancied the straight path to heaven must be. Beyond the grayish veil of cloud that covered the sky, the blue background above, though unseen, was distinctly sensible. The sun did not shine, but a dazzling white light, reflected with intense yet lusterless brightness by the snow-surface, shed a broad halo over the visible world. The air was crisp and sharp, and with the healthy glow of the vigorous exercise Father Taché's spirits rose within him, and he tingled all over with a delicious feeling of vitality.

His religion and vocation apart, this priest

his success. The place was dismal enough, to be sure, but Father Taché had seen too much of the miseries of camp life to be affected by cheerless quarters. After removing his snow-shoes, he started a fire, and kneeled to thank God for his help, without which he could never have reached the bridge. Then, having eaten a few mouthfuls of beef and biscuit, he wrapped himself in his blanket, lay down by the fire, and was soon asleep.

The next morning he arose with difficulty. Besides the lame stiffness to be expected after such a day's journey, his ankles were swollen, and the excruciating pain locally known as the *mal de raquettes* made him wince at every step. After much trouble he succeeded in splitting enough wood to make a fire, over which he heated some brandy, and rubbed his lame feet. Then he crawled to the door and looked out. The sky was clear at last, and in spite of his pain Father Taché sprang up joyfully and folded his hands. He had forgotten all but that God had answered his prayer, and with a heart overflowing with gratitude and joy he sang. And the tall, swaying pines bent their heads and listened, the gleaming birches fluttered their nervous twigs, and the silly poplars shuddered and shivered; while Echo, that most docile of Nature's children, repeated and lingered over the unfamiliar words of the "*Te Deum laudamus*."

But alas for the frailty of human thews and sinews! By noon Father Taché was only six miles from the bridge, and that night, after superhuman efforts and nearly crazed with pain, he barely reached the once famous Camp 42, twenty-eight miles from Yatchedash, twenty-eight miles from hope, twenty-eight miles from salvation. During the day his sufferings had been so keen that he had pushed on more as one walking in a dream than as a conscious human being. What he did on his arrival, or how he effected an entrance into the former storehouse, he could never remember. It is probable that with a vague recognition of the premises he burrowed through the snow until he reached a window, broke down the sash, and tumbled in, to fall asleep immediately after drawing his blanket over his head.

When he awoke the next day he was in utter darkness. For some time he lay quiet, shivering and wondering where he might be, for of the happenings of the last few days he remembered nothing. His mind was as numb as his body, and the only thing he could recollect was a camp scene on "construction," long ago, when, early one morning, he had lain quiet under his blanket as now, hoping that some one would light the fire. Then suddenly the word "*Taskoma*" appeared to him as though written in letters of fire on the wall of the log house, and it all

came back to him. With an intuitive remembrance of his lameness, he attempted to move slowly, cautiously, as one who fears a sudden pain; yet to his surprise he could feel neither pain, nor lameness, nor even fatigue. He was merely numb with cold, and his hands tingled as though they had been asleep. He awoke abruptly, in complete possession of his senses, and, jumping up, made a fire and breakfasted. Then, feeling warm and strong, he rose to go; but the door was wedged fast by the snow outside, and, after vainly endeavoring to push it outward, he turned back to look for a pick or a bar, and made a startling discovery. At the rear end of the long building, and huddled together on a bench-bed, lay three dead bodies, frozen stiff; and in the stern, dark features he recognized three of the four men who had started from Taskoma on the same mission as his own — Jim Nolan and the two Indians, Yellow Joe and Big Hams.

These were the men who had gone before; these were the men in whose snow-covered footsteps he had followed for two days on this fearful journey, and whom on that same day, perhaps, he would follow into the infinite world beyond. It is no wonder, then, that Father Taché was moved as he reverently covered their rigid bodies with his own blanket (he would not need it again, for if he did not reach the Junction by night he would never reach it at all). He stuck his last candle into an empty whisky-bottle, lighted it, and placed it at their feet. Then he blessed them, and turned to go.

Outside the snow was falling again in large, heavy flakes, and in the storm it was impossible to see ahead. As he plodded on, Father Taché for the first time began to question the certainty of his success. Twenty-eight miles in this weather was no small undertaking, and the dismal discovery which he had made at Camp 42 had affected him more deeply than he dared to acknowledge. Once or twice he attempted to sing, but in the solemn silence that surrounded him the songs sounded like a hollow mockery, and after the first verse he merely repeated the words mechanically in a monotonous undertone. Now that he had left the forest and was traveling over comparatively level ground, the telegraph-poles were his only guides, but in the maskeeg, or bog, many had fallen, and were covered with snow; he could not see more than twenty yards ahead, and must grope his way, as it were, from one fallen pole to the next. About noon he began to feel vaguely conscious of having lost the track, and started to walk back; but before he had gone a furlong the shallow marks of his snow-shoes had disappeared under the falling snow. For a few moments he wandered on over the trackless waste, then became alarmed, and turned to go

back; but only a few steps further the trail had once more disappeared, and, after staggering aimlessly, first to the right, then to the left, he knew that he was lost.

Lost! No, no! it could not be! He looked eagerly around for some landmark, some hill, or rock, or tree; but on all sides the silent white curtain, heavy, thick, impenetrable, inclosed him. In his despair he called out, "Lord, Lord, thou hast forsaken them!" and, falling on his knees, Father Taché buried his head in the snow. But, after the first moment of bewilderment and despair, he rallied and prayed fervently for help, not for his own sake, but that his miserable flock at Taskoma might be saved. Day after day, and night after night, as the hunger-fiend drew his net closer about them, they would wander out to the edge of the forest, and stand there gazing wistfully up the road by which he had disappeared. And day after day each would go back sadder and more despondent to watch his wife and children sinking gradually, hopelessly, inevitably into the grave. In his prayers he offered his own life as a sacrifice, and naïvely believing, like some of the old martyrs, that the greater his suffering the more acceptable it would be, he prayed for unheard-of tortures and miseries.

When he raised his head it seemed to him that his prayer had been heard; the snow was falling more lightly than before, the wind was increasing, and the sky was brighter. He ate what was left of the biscuit, drank the remainder of the communion wine, and rose for his last effort, no longer as Father Taché the mission priest, but as Father Taché the chosen martyr. Not far from where he stood there was a ridge in the smooth snow-surface; he ran toward it, and eagerly brushed the white covering aside. It was what he had hoped it might be—a fallen telegraph-pole; and now he could distinguish another and yet another farther on, and with a shout of triumph he cried: "Taskoma is saved! A strong and mighty bulwark is the Lord our God!"

An hour later he had passed the bridge over the Vermilion, and was soon floundering in the deep drifts at the famous Clay-cut by Whitefish Lake. Then came the long trestle, a dangerous crossing in the wind that had set in; but, lying flat on his stomach, he succeeded in crawling safely over to the other side; and it was night again. On and on, step by step, effort by effort, hour after hour, through the silent desolation of snow that surrounded him, Father Taché plodded, with never a friend to encourage, never a soul to admire. Excepting the melancholy moaning of the wind, not a sound broke the awful silence, and in the

increasing gloom neither light nor landmark guided him onward. But under the torn cassock, stiff with ice, his faithful heart beat on, troubled only by the misery of those he loved, not by the misery he was suffering. And, trusting in God, the brave spirit struggled on alone against weakness, and hunger, and the terrible snow-sleep.

Fight on, brave soldier; the end is nearing! Fight on alone, the end is at hand! None will record your sacrifice, none write your history. No glory awaits you here. Only God will know the agony of that bitter night when you reeled, and staggered, and floundered, and fell, calling to him in your delirium for help and endurance, singing his psalms as you tottered on, groaning in your anguish, and unconsciously sobbing that wild refrain, "Starving—starving at Taskoma!" Fight on, Father Taché, the end is at hand!

About four o'clock the next morning the stalwart Hudson's Bay factor stepped out from the cabin near Yatchedash where he had made a night's halt with his Indians. The storm had entirely ceased, and the stars were twinkling brightly from their solemn distance in the black sky. Ross looked up and down the road with a satisfied air, and was turning to call his men when he noticed a curious object tottering toward him, and, reaching for his rifle, cautiously walked toward it, wondering the while at its strange gait and continuous hoarse cries. When he drew near he recognized Father Taché, and caught him in his arms as he fell forward, gasping: "Starving at Taskoma! Help!—for the love of God!"

THEY were white men at Yatchedash Junction, and a preliminary relief-party was organized at once, composed of Mat Murphy the road-master, Father Caron, the sturdy little Doctor Lovey, and Ross with his Indians. A larger party with more supplies was to start later in the day. Their generous haste was rewarded, for they arrived in time to save every man, woman, and child at the Mills. But Father Taché never recovered altogether; and when the snow had disappeared, and the robins whistled again in the tamarack tops, and the Madawaskan Bay was once more a sea of blue and gold, he passed away. They laid him to rest in the sad little graveyard behind the mission, where to-day, when the snow is not too deep, you will find the plain wooden cross that marks his resting-place, and traced upon it by some unskilful hand the words that live in the hearts of those he saved from death:

God bless you, Father Taché!

SOME PASSAGES IN THE HISTORY OF LETITIA ROY.

PICTURES BY MARY HALLOCK FOOTE.

ENGRAVED BY T. L. CALHANE.

THE LANDLOCKED HARBOR.

MISS LETITIA ROY was one of the prettiest girls in Alberta, and much homage was tendered her, from the very day of her arrival, in the little English settlement that surrounded the Hudson's Bay Company's fort; but it was not until six years afterward—not until she reached the mature age of twenty-two, when girls in western towns are almost looked upon as old maids—that she descended to the common level and fell in love like all the rest of her world.

Letitia's prettiness was not a common type. She was rather under the middle height, and her figure was plump and well developed. Her hair was a bright shade of brown, short and curly, and the soft rings fell caressingly on her broad, well-shaped forehead, softening its intellectual outlines. Her eyes were hazel, and shone with unclouded happiness, while, when she smiled, innumerable dimples developed themselves around her somewhat full lips. Fortunately her teeth were small and white, and regularly set, for she showed nearly all of them when she laughed; and it was characteristic of her that she rarely spoke without a laugh. It came as spontaneously as the echo of her words.

In spite of the homage rendered her by the boys, Letitia was what may best be described as a girls' girl, for she cultivated ardent friendships among her own sex, with whom her independence of character and gaiety of heart made her a universal favorite. There were plenty of young men in Alberta in those days, so that Letitia's preëminence did not threaten to bring disastrous consequences upon any of her friends and faithful satellites. Then, although all the young men liked Letitia, it was satisfactorily decreed by fate that all of them should not fall in love with her. Somehow,

in spite of her bright glances, they found it easier to slip into that relation which combines the brother with the friend, and which may, perhaps, be more accurately termed cousinly. Her independent self-reliance was not aggressive, but still it was perceptible, and did not serve to encourage timidly tender advances. She had another defense in the multiplicity of the interests and enthusiasms with which the maiden aunt after whom she was named had early inspired her. This maiden aunt was left behind in England when Mrs. Roy rejoined her husband, and the long six months' voyage around Cape Horn, together with the novelties of her new surroundings, sent Letitia's thoughts for a time into new channels. One by one, however, the old pursuits were renewed with ardor.

The Roys lived in a roomy one-storied cottage on the road that skirted the almost landlocked harbor. It was outside the limits of the old fort of the Hudson's Bay Company, but still was within ten minutes' walk of the center of the town, where, it was scoffingly said by American tourists from San Francisco, a cannon-ball might be fired at noon without hurting any living person. There were only one or two cottages beyond the Roys'. Further on the land was still uncleared, and the bush, with its somber fir-trees and tangled undergrowth, stretched away to the end of the rocky peninsula. In those days everybody in the settlement knew everybody else, from the governor in his recently built stuccoed castle on the heights to the equally solitary telegraph-boy, who had his headquarters in Wharf street.

Mr. Roy had come to the province at the time of the gold-fever; and when that subsided without giving him the fortune which was to have taken him home in triumph to his wife and children, he drifted from one place to another, settling down finally in the thriving little town of Alberta, where he laid the foundations of the famous ready-made clothing establishment which was soon able to supply bankers and miners alike with suitable wearing-apparel. As soon as it was prudent to do so he sent for his wife and children—for Letitia, and Edgar, and for the baby boy he had not yet seen. Mrs. Roy had no ambition whatever to enter into the gay social life of the colony. Her home duties appeared to occupy her incessantly. But for Letitia, she admitted,

case

ENGRAVED BY C. A. POWELL.

LETITIA.

it was quite different. Letitia was an interesting compound of father and mother. Her father's adventurous nature supplied the romantic element in her. Perhaps it was this spirit of romance that prevented Letitia from being satisfied with bread and butter in the shape of the honest youths of her intimate acquaintance, and sent her fancy roving, just as the spirit of adventure, years before, had urged her father abroad to seek his fortune. Homely instincts of duty, however, inherited from her mother, weighted Letitia's wings, and kept her from many a daring act. Their strength was evident in the happy way in which she adapted herself to the old-fashioned groove marked out for the only daughter in a family of boys. In spite of her dimples and her laughter, and the partly unconscious coquetry of her bright glances, the strongest influences long remained those which associated her with her brothers. Fancy-free herself, she officiated as bridesmaid with all the more grace to one friend after another; and she had even assumed the responsibilities of a godmother before she met Charles Neville.

II.

It was at a garden-party at Judge Whyte's that Letitia was introduced to Lieutenant Charles Neville of her Majesty's ship *Stronghold*. Mrs. Whyte was the recognized leader of Alberta society, and her weekly summer garden-parties were attended by all within its magic pale. The Roys were just on the borderland; for the retail department of Mr. Roy's store could not, with the best will in the world, be entirely overlooked by the little colony of select English people. But then it was whispered that he occasionally advanced money, at a high rate of interest, to traveling fellow-countrymen of distinction, chiefly officers of the royal navy, who found themselves inconveniently distant from the base of their supplies; and hence he might be looked upon as a private banker by those who were inclined to take a charitable view. These transactions were frequently arranged in informal conferences on the door-step of the store, or in a stroll along the sidewalk of the principal street, and were often followed by a convivial lunch or dinner on board one of the ships at the neighboring naval station. Such outward and visible signs of intimacy in high quarters could not be ignored. Besides, Mrs. Roy, if somewhat homely, was considered a lady by the other ladies of the town; and as for Letitia, she was not a girl to be passed over anywhere, and in a colonial town on the Pacific coast was actually a mine of wealth to an ambitious hostess who wished to make her house an attractive one. So Mr. and Mrs. Roy were invited to dinner

by the judge's lady at least once a year, and Letitia, or Letty, as Mrs. Whyte preferred to call her, was welcome on all occasions when young people were present.

It was the naval element that gave both tone and variety to Alberta society. It had the advantage of constantly changing, and therefore could never grow monotonous. In the easy intercourse of colonial life Letitia had danced with several admirals and with many gallant captains, while the young middies fraternized with her brothers at foot-ball and cricket, and were always made welcome at the cottage on the Harbor Road. Lieutenant Neville did not therefore flash like an unexpected meteor upon Letitia's horizon. He arrived in the spring with the *Stronghold*, and it was quite in the ordinary course of events that he appeared at Judge Whyte's first garden-party in May. Letitia was there, equally as a matter of course, and the magic words, "Mr. Neville, Miss Roy," were pronounced in Mrs. Whyte's ordinary even tones. Neville and Letitia found themselves opponents at croquet, a much more piquant relation than that of partners. They were well-matched players, but Letitia finally pegged her opponent. Then, surrendering their mallets to later arrivals, they went laughing and chatting across the lawn and up the steps of the veranda, where Mrs. Whyte was dispensing tea and claret-cup. Neville's sunburnt face had the same buoyant, gladsome expression that distinguished Letitia's. His laugh was as gay as hers, his teeth as white under his fair mustache, and he had the gracious manners of a happy nature in addition to the well-bred air of a young man of the world.

"What a charming pair!" murmured Mrs. Whyte as they came up the veranda steps, Neville just behind Letitia.

Some of the elder ladies were grouped round Mrs. Whyte's tea-table. A Chinaman in a spotless white tunic with wide, hanging sleeves, and with his queue neatly braided round his head, was deftly handing round the tea-cups and the cake. His calm, expressionless brown eyes took in everything, and he quickly brought refreshments to Letitia and her companion, who were standing near a group of young people.

"You likee tea, Miss Loy?"

"Oh, thank you, Hing," said Letitia; "heap likee. But this man, Hing," she added, turning to Neville, "I think he likee claret."

"No, no," interposed Neville; "I likee tea."

"Tea velly good," said Hing, solemnly.

"Yes," replied Letitia, in assent; "but sometimes white man not savvy what good for him."

Neville's eyes followed Hing with some curiosity.

"Do you talk to all of them like that, Miss Roy?"

"Oh, Hing understands English very well," said Letitia. "He has been five years with Mrs. Whyte. We have had Chinese boys at home who scarcely knew a word of English when they came to us. However, they soon pick up the names of things, and we just skip the verbs." Neville drank his tea, and then carried his cup and Letitia's to the table.

"What a beautiful country this is," he said, when he returned.

Judge Whyte's house was built on the heights,

at her companion. It is not every man in the far West that can quote Tennyson appreciatively.

"That," she said in a few minutes, "is the charm that our scenery lacks. The charm of association," she added, as Neville looked inquiringly at her. "Our lakes, our hills, our streams are beautiful; but it is beauty without history, without anything behind—the beauty of a merely pretty face," she continued, with an increase of color and a shade of embarrassment that Neville found charming to watch. "There are no stories, no romances, attached

"NEVER HAD THERE BEEN SUCH A BEAUTIFUL SUMMER."

ENGRAVED BY J. P. DAVIS.

in the aristocratic neighborhood of the governor's castle. From the raised veranda Letitia and Neville could look over the low, one-storied cottages beyond, which were built on the south slope of the hill, and were almost hidden by the blossom of cherry-trees, right away to the blue water of the straits, and to the range of snow-clad mountains on the American side.

"The mountains are especially beautiful today," said Letitia. "It is not always that we see that cleft in them, that opening yonder, between what must be two distinct ranges."

"Yes; I have not noticed it before," exclaimed Neville, with interest. "It looks like an opening into fairy-land."

"The gateway to the plains of heaven," suggested Letitia.

"Or to

"The island-valley of Avilion,
Where falls not hail, or rain, or any snow,
Nor ever wind blows loudly,"

said Neville, sympathetically.

Letitia glanced with pleasure and surprise

to them, as there are to all the glens and mountains of Scotland and Switzerland."

"Then you prefer European scenery?" asked Neville.

"I do not really know. I cannot say," replied Letitia. "I have only read about it. I was fifteen when we left England, but we had always lived in the same little country town."

There was a movement among the young people, some one having proposed an impromptu dance in the drawing-room. Neville and Letitia were consulted. Through the French windows, which opened on the veranda, it could be seen that the room was rapidly being cleared. The dark polished floor looked very inviting.

"Miss Roy plays some good waltzes," suggested Mrs. Whyte. "Letty, will you play first?"

Letitia at once went to the piano. Mrs. Whyte introduced Neville to several pretty girls, all wearing white dresses and sailor hats. They were so much alike at a first glance that Neville found it a little perplexing to distinguish

one from another. Letitia played well, but she waltzed even better, as Neville found out later in the afternoon. At the end of one of the dances Letitia introduced him to her brother Edgar, who was paying great attention to one of the sailor hats. It all seemed very delightful and informal to Neville, and he looked forward to having a very jolly time at Alberta.

III.

LIEUTENANT NEVILLE called upon Mrs. Roy the following week. Alberta etiquette made this almost obligatory, for Mr. Roy had called upon all the officers, collectively, as soon as the *Stronghold* arrived at the station. Neville received the kindly welcome from Mrs. Roy which she extended to all young fellows away from their homes. She seemed to him a comely, motherly woman, and he at once felt at ease in her house. The intimate love and confidence that existed between her and Letitia was charming to see. The boys seemed to belong to them equally, so prettily did Letitia enter into her mother's feeling of responsibility regarding them. Neville was in a mood to be impressed by so pleasant a picture of family life. The Roys gave few formal entertainments, but they were very hospitable in their own way; and Neville made it so frankly apparent that he enjoyed his visits that he was soon cordially invited to visit them whenever he pleased. He had been sufficiently long on board ship to appreciate every homely detail. He found it delightful, for instance, to watch Mrs. Roy dispose of a big basketful of the boys' socks. Neville had had experiences of his own in darning, and he inspected the mended heels and toes with the interest of a connoisseur. Possibly Letitia might have been blind to Neville's gifts and graces if she had grown up side by side with him. It is difficult for a young fellow to pose as a hero before a girl who knows exactly what place he took in his school examination, or who has seen him treated by mother and sisters as though he were a very fallible mortal. Heroism, and genius, and all the other fine qualities that bring a woman to her knees, are generally found by her in some one outside the intimate circle. It was not a difficult task to idealize Neville. He had a fine tenor voice, and he sang

Bid me to live, and I will live
Thy protestant to be;
Or bid me love, and I will give
A loving heart to thee,

with a fire and abandon that alone took Letitia's heart by storm. The duets which they practised together brought them into still closer harmony.

An acquaintance like this is not to be reckoned by weeks and months. Love, under favorable circumstances, is capable of a tropical growth. Unfortunately neither Neville nor Letitia stopped to consider the nature of the plant they were nourishing. But never had there been such a beautiful summer in Letitia's remembrance of Alberta. Never had she felt so glad and gay. How beautiful was life! How dear were her brothers! How intoxicating the sunshine and the flowers! A charming haze enveloped the mountain-tops and made their outlines vague and indistinct. So it was with the future, Letitia dreamily thought. It spread itself out in the distance, fair and unknown, and Letitia had no desire to unveil it.

Neville came and went. There were garden-parties every week at Judge Whyte's. There were occasional afternoon dances on board the *Stronghold*. There were picnics by boat and by carriage. Mrs. Roy, anxious mother as she was, saw no cause for alarm. She looked perhaps a little closer at the future than Letitia did, and her heart, by and by, began to ache, as the thought of a possible separation from her daughter occurred to her. There was, however, in Letitia's manner a reserve, a guardedness, a coyness, an inexpressible something, visible in her otherwise frank intercourse with Neville, that had prevented the nearer approach of lovers in the past, and that made Mrs. Roy feel by no means certain how the young people would shape their affairs. Neville had won her heart, and she wished him success. That he desired it she did not doubt. As the summer days passed quickly away Neville had less and less time, and perhaps less desire, to analyze his feelings. Everything was very jolly. The Roys were a delightful family; while, as for Letitia, she was out and out the prettiest girl he had ever met. He was not so frank with himself in acknowledging the disappointment that possessed him whenever Letitia was unexpectedly absent from a gathering; or, if he was aware of it, he took pains to attribute it to some other cause. "You lost nothing by not being at the Simcoes' the other evening," he would observe to Letitia the next time he saw her; "it was very flat." Some feminine instinct, perhaps, prevented Letitia from expressing her surprise. The Simcoes' dances were generally looked upon as social events beyond criticism, and Edgar had enjoyed himself as usual.

The pyracanth berries turned red; dahlias and chrysanthemums succeeded the roses. The mists were blown from the mountain-tops by the light evening breezes. The future, too, began slowly to unveil itself in the shape of rumors that the *Stronghold* was to go south before winter, and that the *Spitfire* would take

her place: Edgar was always the first to hear news, and one night he went home with the report that a telegram had been received from headquarters. He blurted it out at once, expecting it would excite great interest. But Letitia, who had been singing, began slowly to put her music in order without saying a word, and Mrs. Roy so promptly rebuked the boys for some piece of carelessness of which they one and all protested they had not been guilty; that, in the animated discussion which followed, Edgar's news was overlooked. The following day Neville called and confirmed the report. He openly expressed his regret, and, under the circumstances, seemed to expect the invitation to remain to dinner that Mrs. Roy at once gave him.

"Would you like to have one of our new little dogs to take with you, Mr. Neville?" asked Johnnie, the youngest of the family, and the only one who was called by a pet name, the excuse being that his father had monopolized "John." "I will give you one, if you like."

"Come and look at them," urged Alfred. "They are running about in the yard."

"You had better go with them, Letitia," said her mother, noticing that she was in doubt.

Neville admired the two little black dogs that scampered round and round the boys' legs, and, being asked to suggest names for them, christened them Flip and Flounce on the spot. He said that he was afraid they might get seasick on the ship, as they were not accustomed to sailing, and that the boys had better keep them for him until next summer, and meanwhile take them out in the boat as frequently as possible. The boys accepted his advice, and ran off to tell their mother of the arrangement, and to see if she approved of it.

Letitia and Neville loitered in the flower-garden instead of returning to the drawing-room; but neither of them referred to the approaching separation. It was uppermost in Letitia's mind, however, all the time, and she was scarcely as buoyant and gay as usual, although the matter-of-course way in which Neville spoke of his return next summer had lightened the load that had weighed upon her spirits since the previous evening. She was glad to be rid of that horrible sickening sensation which she had then experienced for the first time.

"Would n't it be pleasant to sit here?" said Neville, pointing to the bamboo chairs on the veranda.

Letitia assented. It would be much pleasanter than going indoors.

From the veranda they overlooked the little harbor, on one side of which clustered the wharves and warehouses of the town. On the other side, which was more rocky, there were only the scattered huts of the Indian Reserve.

A sailing vessel from England, which had weathered the storms of the Cape, was being slowly towed in. Its dingy paint and battered aspect were in strong contrast to the trim smartness of an American revenue-cutter that lay at anchor. Neville called Letitia's attention to this, and she, in her turn, commented on some sealing-boats, the first of the season, that had returned from Bering Sea. The conversation remained in these safe channels, into which it had casually drifted, until the six-o'clock whistles sounded from the town workshops. Ten minutes later Mr. Roy and Edgar might be expected from the store. Neville pushed back his chair, and rose to stretch his limbs. As Letitia shook from her lap the petals of a chrysanthemum that she had been pulling to pieces in an absent-minded way, Neville smilingly referred to her destructiveness. Letitia gaily retorted. Mr. Roy and Edgar presently waved their hands and nodded to them from the sidewalk.

"Hullo! how d'ye do?" cried Mr. Roy, when he came within speaking distance. "I hear you're off to the south. I wish I were going along with you."

"Yes," said Neville; "our sailing-orders came last night, I'm sorry to say. I've had an awfully jolly time here."

Letitia was sufficiently accustomed to boys' slang not to wince at the "awfully jolly." It was the masculine way of describing everything delightful.

"I hope I shall be lucky enough to get back next summer," continued Neville, with characteristic buoyancy.

"When do you sail?" asked Edgar.

"That is n't settled," said Neville. "But I think I've a month's grace. It will take nearly that length of time to prepare."

When he spoke of the month's grace he turned with a slight, possibly unconscious, movement toward Letitia. Letitia rejoiced. These half-betrayals are often the food upon which love nourishes itself.

IV.

DURING that month of grace Neville talked with so much regret of his departure, and looked forward with so much certainty to a return the following summer, that the weight at Letitia's heart almost entirely disappeared. Her laughter echoed her words as gaily as ever, and bewitching smiles illuminated her face. Neville visibly rejoiced in her presence. The autumn days were calm and serene; but a crispness in the air, out of the sunshine, and an occasional touch of frost at night, were reminders that winter was approaching. Letitia had occasional reminders, too, of the approach of

her bitter season, but she had gained courage to look forward to the summer. Alberta society never allowed any occasion for festivity to slip by unnoticed. Indeed the English colony was renowned for its gay hospitality. As soon as the day was fixed for the departure of the *Stronghold* the citizens bestirred themselves to give a ball to the admiral, and the officers, in return, gave a farewell ball in the dockyard.

"In a few weeks you will be welcoming the *Spitfire*," said Neville, with a touch of sentimental jealousy which Letitia was quick to note.

Letitia had a new dress for these balls, and a new ball-dress was by no means an everyday event in Alberta. She was far too pretty and popular for Neville to have a chance of appropriating her on these occasions, and he also had his own social duties to attend to. The Roys were not the only people from whom he had received hospitality. Nevertheless, in one way or another, Neville and Letitia were much together during that last month. Mrs. Roy relaxed her discipline and permitted the young people, with Edgar and James as an escort, to enjoy extended rides through the woods. She was also persuaded to consent to a moonlight excursion on the water, up the inlet. On this last occasion Letitia's five brothers were considered to constitute a sufficiently strong body-guard, and Mrs. Roy, who had no great liking for small boats, stayed at home.

The sun was setting as they pushed out from the low pier, but the rich sunset lights lingered long afterward above the dark, fir-clad hills of the island. Very gradually they faded and merged themselves in the blue sky overhead, which then grew darker and darker, until the stars appeared, and the full moon rose majestically over the town. By that time the Roys had almost reached the Narrows, where the tide rushed with tremendous force between projecting rocks. The younger boys wanted to row through, and urged that the current was with them. But Letitia protested. Edgar was captain of the crew, and Neville set the lesson of obedience. As a compromise the boys were allowed to land and scramble over the rocks. Edgar undertook to stay with the boat, so Letitia and Neville presently, at Edgar's suggestion, also climbed up the rocks, and strolled through the woods to a point that was celebrated for the beauty of the view it commanded.

How could a pair of lovers fail to be moved by the influences of the hour? The pine-woods were dark, and the trail was narrow and tangled with briars. It was impossible to walk side by side, and therefore it was difficult to talk. Often the lapping of the water on the shore, and the crunching of cones under their feet, were the

only sounds that disturbed the stillness of the evening. In the distance the boys' voices could now and then be heard, and occasionally there was the splash of Edgar's oar on the water as he drifted patiently backward and forward. Letitia led the way, for she knew which trail to follow; but Neville was only half a pace behind her, near enough to pull aside the boughs or to hold down the straggling brambles that impeded her course. Sometimes a ray of moonlight pierced the heavy, somber pine-branches overhead, and fell for a moment on her fair neck; sometimes it touched the soft rings of hair that clustered round her ears; and sometimes, when she half turned toward him, Neville was able to look for a moment into her hazel eyes. They were scarcely conscious how trivial were the remarks they made to each other. For the instant the senses were dominant.

Suddenly the path led them out of the woods on to the high bluff which Letitia had been trying to gain. Below them, and stretching as far as they could see to the right and the left, the deep waters of the inlet glimmered and gleamed in the moonlight. On the opposite shore an arbutus-tree distinctly projected itself from the pine-wood, and threw a weird shadow on the rocks. Letitia lifted her face to Neville to call his attention to it, and the next moment Neville's arm was round her waist and his lips were pressed to hers. The moonlight, which beautified everything on which it fell, beautified Letitia's features, and Neville yielded to an irresistible impulse. Letitia's equally irresistible impulse was to draw back, in shyness or in fright, and she followed the impulse even while her first surprise gave way to rapturous happiness. There was no longer any doubt that Neville felt even as she did. She half turned as she reached the edge of the woods to listen to the words that must come now without delay. Alas! the boys' voices were coming nearer and nearer. As for Neville, he was filled with dismay. What excuse could he offer for his mad conduct?

"Forgive me," he murmured as he rapidly followed her.

Letitia gave him her hand in reply, and he raised it to his lips.

The boys' voices sounded harsh and shrill in the silence of the evening. Neville scarcely knew whether he was glad or sorry that they were so near. He managed to recover himself before the boys themselves appeared; and to withdraw their attention from Letitia he plied them with question after question, to all of which they had eager answers to give, besides much extra information to impart. In spite of the narrow path, Neville managed, in the darkness, to retain Letitia's hand until they reached the boat.

v.

UNFORTUNATELY marriage did not present itself to Neville's imagination as the simple, easily arranged affair which Letitia's experience had taught her to regard it; and in the events that followed the momentary betrayal of his feelings she was scarcely able to judge Neville's position fairly, and to do him justice. Neville belonged to a wealthy English family. How could Letitia know that, personally, he was far less independent than the son of an artisan? He had no means of his own, and he had been brought up in the belief that to marry upon his lieutenant's pay was an impossibility. Hitherto, in fact, marriage had not entered into his calculations. He had been quite willing to contemplate it only at that probably distant period when he would either receive an adequate allowance from his father or inherit a portion of his father's wealth. But the question of marriage necessarily forced itself upon him after that scene on the bluff. As a gentleman he had his code of honor, which he could not infringe without a painful forfeiture of self-respect. Much depended upon whether Letitia had taken him seriously. Did she not, possibly, realize, as he did, the different bearings of the situation, and understand that they must give each other up, that the avowal of love was the signal for farewell? Yet Letitia was a charming girl. Had he only himself to please, how easily and pleasantly the matter could be settled! But what would his mother say to the match? Lady Caroline Neville and Mrs. Roy! What would happen if he wrote home and announced his engagement to the daughter of an Alberta tradesman (for so they would class Mr. Roy, regardless of mitigating circumstances)? Threats and entreaties might pour in alternately by every mail; or there might be a cool shrug of the shoulder and an intimation that he could, of course, do as he pleased, but that he need expect neither help nor countenance from his people. It occurred to him to throw up his profession, and to trust to Mr. Roy to put him in the way of earning an income. But that idea was quickly dismissed. It would be intolerable. For a moment, however, he envied Edgar Roy, who could marry when and whom he pleased.

These thoughts tossed through Neville's mind for twenty-four hours; but the habits and traditions of his family could not longer be set aside. At the end of twenty-four hours they began to reassert themselves, and he had at last to own their dominant influence. An offhand invitation to join a shooting-party that was given at this crisis was accepted with alacrity, since, at least, it deferred decision. A few brace of grouse, sent with a note to Mrs. Roy, would

explain his movements, and Letitia, if she were a sensible girl, would draw her own inferences. Letitia, unfortunately, had not that experience of Old World civilization which would have given her the clue to the comprehension of Neville's fettered condition. For her his kiss was the definite avowal of love. Words would follow as a matter of course. Her dreamy ecstasy betrayed her to the quick eyes of her mother, and Mrs. Roy, partly because she would not allow herself to question her daughter, was in a greater flutter of agitation than Letitia.

The future had revealed itself; and how fair it was! thought Letitia, as she looked from her bedroom window upon the pure-white range of the Olympians. She recalled Neville's words the first time she met him:

The island-valley of Avilion,
Where falls not hail, or rain, or any snow,
Nor ever wind blows loudly.

In such a sheltered valley would their lives be spent.

In shy happiness Letitia kept close to her mother's side the whole of that first day. Neville might appear at any moment, and she was timid at the thought of meeting him alone after their mutual confession on the bluffs. The second day, however, she was sure he would come, and the delay had given her courage to put on her prettiest gown. She even stepped more than once to the veranda, which commanded a long stretch of the road. The third day she began to grow impatient and just slightly anxious. Neville's truth was beyond question, but had she, perhaps, repelled him? She had certainly withdrawn from his embrace. She had been glad of the presence of the boys. In the boat she had been separated from him. Did he, could he, think that she was indifferent? How easily she could dispel such an idea if she could only see him; but until then—

"Your manners are just a trifle too reserved, Letitia," Mrs. Roy took occasion to say during the course of the morning, when she and Letitia were looking over the household linen together. She felt that some such hint at this crisis might do good, for to her, too, had occurred the thought that Letitia might unconsciously have snubbed Neville. Letitia was now convinced that she had been in fault, and she sighed for an opportunity to repair her error. In the evening Edgar remarked casually that he had met Neville.

"He was in a great hurry. He was off to Quamichau with Gowan and Tyldesly, and he just stopped me to say that he hoped to send you a bag of game."

In a few days the game arrived, a quarter of venison and three brace of grouse—"with Mr. Charles Neville's compliments."

He had returned then. He could delay a visit no longer. Letitia waited for him at home, and was rewarded by hearing of him from the boys, who met him frequently about the streets and at their father's store. Letitia could, at last, no longer avoid the conclusion that he was purposely keeping away from the cottage. And the day of his departure was fast approaching. Letitia's way out of the difficulty was a very simple and straightforward one. If he feared to come to her after what had passed between them, she would write and ask him to come. It was a daring thought, but, when once conceived, was promptly and courageously carried out. The note, when it was finally written, was a very innocent one. She wrote, "My dear Mr. Neville," instead of "Dear Mr. Neville," and she concluded by adding "always" to the "yours sincerely" of the first rough draft. The significance of the note lay in the fact that it was a message from her, and not from her mother. She said that she had been hoping each day to see him, and had not gone out much because she feared to miss him. She was glad he had enjoyed the shooting, and they would all be at home as usual on Sunday afternoon.

Letitia expected the answer to be given in person, and the sight of "Miss Roy" on an envelop, in his handwriting, sent the blood rushing to her cheeks and even caused her limbs to tremble. Mrs. Roy checked all remark from Edgar, who brought the letter from the post-office and was inclined to chaff his sister, by telling him she wanted him to bring a hammer and nails at once to the chicken-house and to fasten up some netting that had been blown down by the wind. She carried him off with her in a whirlwind of words, and Letitia was left alone to open her letter. "Dear Miss Roy," it began. "Not *my* dear," noted Letitia, swiftly.

I was of course pleased to receive your letter, and I regret a preengagement for Sunday afternoon. I am sorry, too, that I should inadvertently have detained you so much at home. It did not occur to me that you might be expecting me, and I have been unusually busy with the preparations for the voyage. I need not say that I hope to call more than once upon Mrs. Roy and you before I leave.

I am very truly yours,
CHARLES NEVILLE.

Letitia was stunned. She read the letter a second time and then a third. What did it mean? Had she been dreaming? Had Neville really kissed her? Had he looked at her with eyes of love, or had she been altogether mistaken? Thought, just then, was impossible. She was too much stunned even to feel pain. She folded the letter very carefully, replaced it in the envelop, and put it into her pocket. She

tried to recall what she was doing when Edgar gave it to her. Her knitting lay on the table, and she mechanically took it up for a few minutes. Then she remembered that her mother and Edgar had gone to the poultry-yard, and she went out to them. Anything was better than the memories which began, like lightning-flashes, to dart through her mind.

VI.

LOVE is said to be stronger than pride. If so, it must be the tried and faithful love of years, and not the fancy that is kindled by mutual admiration, and nourished to maturity by pleasure, but has not had time allowed it to strike deep root into the heart. Letitia's love for Neville was strangled almost at its birth, or she believed that it was. She could no longer think of him with any self-respect. His image was broken. He was identified with the keenest humiliation she had known, and she insisted to herself, whatever the truth may have been, that he no longer had any place in her heart. She counted the days until the departure of the *Stronghold*, but it was to rejoice, with nevertheless a fierce pang of despairing regret for what might have been, as one day after another passed, now only too slowly, away. Every afternoon she found an errand that took her out for some hours; and so it came about that she missed Neville both times that he called at the cottage. Mrs. Roy gave her his message of regret without comment. The smile that Letitia summoned was the wan ghost of the past. The curves of her full lips, the dimples, the small white teeth, were there, but the bright spirit that illumined them had fled.

If Letitia denied her love, Neville was under no such delusion with regard to his own feelings. They grew in alarming strength after he had despatched his letter, which he had sent off in momentary petulance at being called to account. His British independence resented the slightest hint of capture. But his temper quickly changed, and more than once he was tempted to recall his note. However, he had deliberately cut himself loose from the chains which had threatened to bind him, and what was done could not, he knew, be undone. Fortunately for his peace of mind, his judgment still fortified him whenever he reflected dispassionately upon the whole affair. But there were moments when so to reflect was impossible, and then the barrier he had put between himself and Letitia was his only safeguard. He dared not trust himself to say farewell to her in words, but neither could he leave Alberta without looking upon her face once more, that face that had been so passionately kissed when last he had seen it.

The *Stronghold* was to sail early on Monday morning. On the Sunday evening Neville easily found a seat in a corner of the church which commanded a view of the Roys' pew. The church was only dimly lighted by lamps, and the light they shed was concentrated on the nave and chancel. Letitia's seat was within the limits of their rays, so that her face was plainly visible to Neville, who, in another aisle, was concealed by the shadow of intervening pillars.

Letitia sat between her father and Edgar. The mother had, as usual, stayed at home with the younger boys. Neville fancied that she looked pale, but his heart assured him that she had never, at any rate, looked more beautiful. When the service was over she turned to greet a friend, and, as he watched her lips part over her white teeth, and the delicate dimples that lurked round the corners of her mouth develop themselves one by one, he felt that he could give all for love and count the world well lost. But the impulse passed. Outside, in the friendly darkness of the night, he found an opportunity of softly touching her dress. Then he went quickly back to the church, where the man in charge was putting out the lights, and sought for Letitia's prayer-book. He read her name, "Letitia Roy," on the title-page, and the book was in his pocket when he hastened to join his ship.

No one, except perhaps her mother, quite understood Letitia the following winter. Once or twice a week she would go off to bed with a nervous headache, declaring that she could not stand the noise the boys made. There were songs she could not be persuaded to sing. Indeed, she scarcely touched the piano; and the sketches she had taken such pains with in the summer were tossed into the fire as worthless. On the other hand, she developed a passion for plain needlework, bending for hours over long seams.

"No wonder you have headaches," exclaimed Edgar, one night, when she had refused to go out with him. "Mother, tell her to put that work away."

Letitia threw it down, and burst into tears. "Cannot you leave me alone!" she cried.

Mrs. Roy picked it up and folded it neatly when Letitia had left the room, and explained to Edgar that his sister was not very well, and that he had better take no notice of her.

But in a few minutes Letitia returned with her hat and cloak and declared that she was ready to go out. Edgar stared, but he put on his hat and overcoat without a word.

In after years Letitia hated to look back upon that winter. She plunged recklessly into all the gaiety of the little town, and, to the surprise of every one, she even engaged in a

pronounced flirtation with Tom Rickaby, the wildest young fellow in the place, and afterward refused him with some ostentation. She threw over a friend of Edgar's with more compunction, and even with a little hesitation. Indeed, she did not give him a decisive answer until after it was known that the *Stronghold* was ordered home to England, and would not return to Alberta in the spring; so that although she was blamed by many people for having encouraged him, she was acquitted of merely coquetting with him in the absence of Lieutenant Neville, whose attentions, the previous summer, had not been unnoticed. Mrs. Roy said very little, but she planned effective measures.

"John," she said to her husband in the spring, when he was preparing to go to Europe to renew his summer stock, "you must take Letitia with you."

"Letitia!" said Mr. Roy, with some surprise. "I had thought of taking Edgar and introducing him to the firms we deal with. It is time he took greater responsibility on himself."

"Well, take them both," urged Mrs. Roy.

"Do you really mean it? Do you know what it will cost?" he asked, after a few minutes' deliberation.

"I do mean it, John," said Mrs. Roy, with an emphasis that her husband never disregarded. "Letitia is not well. She needs a thorough change, change of scene and change of thought. We'll manage to economize in some other way, but you let her and Edgar have a month in London together, and, if possible, send them over to Paris for a week."

Mr. Roy lifted his eyebrows and thrust out his lips — signs of dawning comprehension.

"You're bent on going it, madam," he said, after a pause. "Well, I suppose you've got your reasons, and it must be as you say."

VII.

So it came about that Letitia not only went with Edgar to Paris, but, when he and his father returned to Alberta, she remained in England, and paid a long visit to her mother's relatives. She fell once more under the influence of her maiden aunt, to whom she faithfully promised to send dried specimens of all the ferns and wild flowers that grew round Alberta. The months that she spent with Miss Wingate gave her an opportunity of studying the usefulness and independence of an old maid's life, and Letitia became so enamoured of it that, with a touch of her old enthusiasm, she at once planned out a somewhat similar career for herself. Away from Alberta her pride slowly recovered from the blow it had received, and she less reluctantly admitted her love for Neville. As soon as that was granted it clearly

followed that marriage with another was impossible. That love could come only once in a lifetime was one of the dogmas of Letitia's faith. But she did not give way to despair and despondency because her day was past. The more she regarded the sublime serenities and free devotion to unselfish service which characterized her maiden aunt, the more attractive grew such a career for herself. She would henceforth be the stay of her parents, the guide of her brothers. In order to be able to help the latter to develop whatever musical and artistic tastes they might possess, she forced herself to renew her old pursuits, and unselfishly made a point of taking lessons both in music and painting. Such efforts worked their own cure in time. Life was not to be barren. If an absorbing passion was denied, a variety of minor interests might be consciously cultivated, which, in time, would take its place.

It was in this exalted mood that Letitia returned home after a year's absence. Her mother laughed at her wisdom and her ardor, but nevertheless encouraged her to carry out her plans. She was content to have recovered her blithe, sunny-tempered daughter.

"Why, you look younger than when you went away, Letty, and you are prettier than ever," said Mrs. Whyte, with the not unpleasant patronage of an old friend.

"You can get out of the ruts. You have no cares on your shoulders," said Mrs. Roberts, with a plaintive sigh. Mrs. Roberts had been a school chum of Letitia. She had married early, and four young children now claimed all her thoughts and attention.

"Do you call this little woman a care, Belle?" said Letitia, lifting her godchild to her knee. "In a few years she will be the greatest help and comfort to you, and I shall be a lonely old maid. I am the one to be pitied."

"You an old maid!" said Belle, derisively. "I shall believe it when I see it."

"I shall be twenty-five next birthday," said Letitia, seriously.

Very few old maids are to be found in western towns, and it was, perhaps, because Letitia was the nearest approach to the real thing that Alberta possessed that, as years went on, so much attention was paid her. No party was considered complete without Miss Roy, or "Miss Letty," as it gradually became the custom to call her. As the boys married, and it came to pass that little children once more played about the cottage, Mrs. Roy tolerated for them the use of the more easily pronounced diminutive; but she herself continued to speak of her daughter as Letitia. In time she made a charming chaperon. But chaperons may be wooed as well as girls; and if, by degrees,

the young fellows that she had known in pinafores approached her as a friend and confidante in their love-affairs, there still remained plenty of bachelors with whom Miss Letty was a favorite toast. As years went on, of course their ranks were thinned, and one by one they dropped out of Letitia's circle. The ships, however, of the Pacific squadron, one or two of which were always stationed near Alberta, supplied men who temporarily filled their places, and the interest attached to novelty competed pleasantly for her favor with old associations.

But the time came—it was when Letitia was about thirty-five—when only one permanent admirer, so to speak, was left. In numbers Letitia had found safety. When all counteracting and disturbing influences were removed, she found herself defenseless and exposed to an obstinate attack. It was inferred by all that the day was not far distant when Letitia would yield.

Mr. Joseph Hobday was a man of substance, both materially and physically. He had come to the province as a contractor for the railway that was to unite the outlying Pacific province with the busy, prosperous cities of the East, and by successful enterprises and investments he had amassed a considerable fortune. He did not seek to disguise his admiration for Miss Letty, and from the day of their first acquaintance he enrolled himself among her followers. He was not a man of many words. He loved his pipe, his glass of toddy, and his game of cribbage; but had Miss Letty demanded the sacrifice, he would no doubt have been found willing to give up all three in exchange for her society. It was one of Letitia's charms, however, that from her no such exactions need be dreaded. It was only in the winter months that Mr. Hobday could pursue his courtship. In the summer he was camping with his engineers in the lonely recesses of the mountains. The news was scanty that penetrated the high valleys through which the iron rails were perseveringly making their way, and another man might have grown impatient of the solitude, fearing lest the prize he sought to gain would be snatched up in his absence. Mr. Hobday, however, had a comfortable belief in himself. In the past he had never hazarded his fortune upon a single stroke of luck, or trusted to the flash of genius. He had been content to wait, to advance slowly, and to win his way by persistent determination. When, again and again, after months of silence, he returned to Alberta and found Miss Letty still Miss Letty, it was only natural that he should still more hopefully expect to appropriate to himself the comfort and charm of her constant companionship. Apathetic as he may have appeared to younger men,

he really left nothing undone that might insure success; he delighted Letitia with the specimens of rare mountain-ferns that he brought her, and arranged carefully in a cabinet her valuable collection of various kinds of ore.

When Mr. Hobday finally made up his mind that the time had come to give up his roving life and to establish himself in a settled home, Miss Letty's preference guided him in the selection of a few acres of choice land within convenient driving distance of Alberta; and it was Miss Letty who was asked to criticize the architect's plans and to suggest improvements. The size of the house and its many

conveniences in the shape of presses and cupboards—conveniences which Letitia declared were absolutely necessary—made it evident to all that Mr. Hobday had no intention of being its sole occupant.

Strange to say, it was on the very same bluff, overlooking the narrows of the inlet, where Letitia had long ago been kissed by Neville, that Mr. Hobday advanced the idea of a trip to San Francisco for the purpose of buying furniture.

"And I've come to depend so much on your taste, Letty," he said, "that you must not desert me now."

M. E. Angus.

THE OCEAN POSTAL SERVICE.

FOR many years after the founding of New Amsterdam, in 1614, there seems to have been no officially recognized post-office in what is now known as the city of New York. The arrival of a ship was looked upon as the most important event in the life of the colony. There was always a crowd at the wharf, and, in course of time, when a little system was applied to the proceeding, it was the custom to deliver to the merchants letters relating to the

ship's cargo, after which the general correspondence was distributed to the waiting and impatient crowd. If the owner of a letter could not be found, it was given to some responsible resident, who kept it until it was called for. In 1657 we find that a law was passed forbidding any person going on board any newly arrived ship from the fatherland, or elsewhere, until the letters had been delivered to the Honorable General of the colony. In explanation of this order it was stated that many mistakes had occurred, and many complaints had been made that letters and invoices were lost; thereafter letters were not to be delivered to the general public before a proper list of them had been made. The necessity of this law would certainly seem to argue that the mail-delivery was a little too exciting for our Dutch ancestors, and that the proceeding was not conducted in the slow and stolid manner that usually characterizes the doings of the race. Two years later, on the complaint that outgoing letters were lost through being badly directed by private skippers, a law was passed forbidding skippers, sailors, and passengers who were sailing out from taking

with them any private letters. "In order that letters may accordingly be conveyed more certainly and better, a box is appropriated at the office of the Secretary of the Director-General and Council, in which letters are to be deposited; and if any one require a receipt for his letter, it shall be given him by one of the clerks, and the letter recorded on the list, on condition of paying three stivers in wampum therefor." The introduction of the collection-box and the registry system seems thus to have been first used at this very early day in connection with the ocean postal service.

As early as 1673 it was proposed to establish a post between New York and Boston, but, owing to the Dutch war and other causes, the project fell through, although Massachusetts afterward appointed a local postmaster at Boston. Governor Dongan, in 1684, proposed to set up post-houses along the coast from the Carolinas to Nova Scotia.

The first parliamentary act for the establishment of a post-office in the English-American colonies was passed in April, 1692, and the royal patent was granted to Thomas Neale for that purpose. He was to transport letters and packets "at such rates as the planters should agree to give." The rates of postage were accordingly fixed and authorized, and measures were taken to establish a post-office in each town in Virginia, when Neale began his operations. His patent expired in 1710, when Parliament extended the English postal system to the colonies. The chief office was established in New York, to which letters were conveyed by regular packets across the Atlantic. A line of post-offices was soon after established on Neale's old routes, north of the present city of Portsmouth, New Hampshire, and south to Philadelphia, and irregularly extended, a few years later, to Williamsburg, Virginia. The

post left for the South as often as letters enough were deposited to pay the expense. The rates were fixed, and the post-riders had certain privileges to travel.

What was called "the coffee-house delivery" of letters was probably the most unique feature connected with the early ocean postal service. The system originated from the fact that masters of vessels and the residents of Breucklyn, Pavonia, and Hackensack left letters at some well-known tavern previously agreed upon. This system of delivering the ocean mail lasted for many years, until after the English took possession of New York. The first printed mention of the coffee-house proper is found in the "New York Gazette" for March 1, 1730. Mention is there made of a sale of land by public vendue at the Exchange Coffee-House. This building was the first or Old Exchange. It was constructed in 1691, and was located at the foot of Broad street. After having been used for a long time as a shambles, it was repaired and became a resort for dealers in food-products and for merchants generally. The water-front during this period was a favorite resort for the maritime portion of the community, who patronized the small taverns located along the wharves.

In 1743 the Merchants' Coffee-House, located on the southeast corner of Wall and Queen (now Water) streets, was a popular resort. A third famous coffee-house, with which a few of the oldest inhabitants are probably familiar, and which was demolished only a few years ago, was the Tontine. This was erected between 1792 and 1794 by an incorporated association called the Tontine Association, in honor of Tonti, a Neapolitan, who introduced a similar scheme into France in 1653. The word Tontine designated a loan advanced by a number of associated capitalists for life annuities with benefit to survivorship.

From the time when the coffee-house was started until after the Revolutionary period it filled the place now occupied by two very distinct institutions, the exchange and the club. The old Dutch and Knickerbocker merchants believed in "living by the way," and were in the habit of combining sociability with business. They were accustomed to meet at their resorts in the middle of the day, and, over a glass of ale or coffee (it was pretty sure to be schnapps in the case of the Dutch), to talk about social happenings and business prospects. In the smaller seaport towns along the coast it was the custom for the people to turn out *en masse* to greet the arrival of every vessel, receiving such mail as the officers of the ship brought over, and exchanging news and gossip with the ship's crew. When vessels arrived at the harbor of New York, the captain took the mail intended

for the general public to the coffee-house, where the letters were put into a box, or stuck behind strips of tape that were drawn tightly over a good-sized board covered with green baize. Here they would remain until called for, and sometimes it would be a long time before the owners of them could be found. In the days when the Dutch had possession of the town there was an unusual effort on the part of the frequenters of these resorts to see that the correspondence was promptly delivered.

After the war of 1812, when the rights of American commerce had been secured, the packet service was brought into existence by the growing trade between the United States and Europe. The Black Ball Line, started in 1816, was the first of several lines of vessels which in those days were unrivaled for strength, beauty, and speed. It was not until 1843 that the United States had any regular mail service on the ocean, and after 1812 letters were sent upon sailing ships that were bound for the ports to which they were addressed. The facilities for foreign correspondence were very much better than they had been; the trips were made more frequently and in better time. The passage from New York to Liverpool was made several times in fourteen days, which was then considered a quick trip. In 1817 packets sailed from New York to Providence, Rhode Island, every week, sometimes taking eighteen hours and sometimes a whole week. Over the cabin stairs hung a mahogany letter-box, and on arrival there would be a rush of people to the packet to get letters in advance of the slow mail that came over the post-roads. As soon as the immediate business of landing was over, the captain would pour the contents of the letter-box upon a table, and, after the distribution of letters, decanters were produced and everybody drank the captain's health.

After the packet service came the brilliant era of the clippers, from 1840 to 1855. These ships were built expressly for speed. The growing trade of the United States with China and India, and the discovery of gold in California and Australia, developed this craft. In 1851 the *Flying Cloud* went to San Francisco from New York in eighty-four days—the fastest trip ever made by a sailing vessel. In 1854 the *Dreadnought* became celebrated by reaching Sandy Hook as soon as the Cunard steamer *Canada*, which had left Liverpool one day earlier, reached Boston. In 1846 the *Toronto*, a packet-ship of the Morgan Line, beat the Cunard steamer from Liverpool, bringing a copy of the London "Times" containing news from Europe forty-two days later than the last paper received. The paper was given to a reporter of "The New York Herald," which

published an "extra" the same afternoon. The packets and clipper-ships unofficially carried mails, and the increase of speed in ocean travel was especially appreciated by the letter-writing public.

In the year 1845 Congress passed the first law having reference to ocean mail transportation. This law authorized the Postmaster-General to make contracts, not exceeding ten years, for the transportation of mails to any foreign port. All such contracts were to be made with citizens of the United States, and the mail was to be transported in American vessels by American citizens. By this time the foreign mail had become a very important factor from both a business and a governmental point of view. The Government was then paying to the Cunard line about a million and a half dollars annually for postage and freight, and that line had become so prosperous that a duplication of the steamers was contemplated. Another provision of the act referred to was that preference should be given to the tenders of persons proposing to perform the service in steamships suitable for vessels of war and claimable by the Government when needed for that purpose at an appraised valuation. This act seems to have been intended as a first step toward the creation of a steam navy,—in imitation of the policy pursued by Great Britain at that time,—the national defense and the protection of commerce in the emergency of a foreign war being the principal objects in view, the conveyance of the mails being subordinate. After experiments on a considerable number of lines, extending over a period of ten years, Great Britain found that the employment of steamers of the navy in the postal service was inefficient, costly, and cumbrous, and finally abandoned the method.

In the United States Senate, the following year, ocean mail transportation was the subject of a spirited debate, the discussion being on a resolution authorizing the Postmaster-General to apply \$25,000 of the money appropriated for mail transportation for a line of steamers from the United States to Bremen, and \$25,000 for a line of mail-steamers from the United States to Liverpool. The people of Germany and Prussia looked upon this enterprise as very important. A special agent was sent by the German authorities from Bremen for the express purpose of aiding in the completion of the work of beginning direct communication between the United States and the German states, and with a view to enlarging the commercial and political intercourse between the two countries. There were some senators who strongly objected to this scheme. It was argued that the ocean mail could not be carried on profitably, that a line of steamers should

not be granted to New York to the exclusion of other ports. Boston, Philadelphia, Charleston, New Orleans, and all the principal cities on the coast would be petitioning for the establishment of mail-lines to Europe. Merchants would demand a line not only to Liverpool, but to the East Indies and to Buenos Ayres. It was urged that the Government might better establish more post-offices in the interior of the country instead of appropriating money for the ocean service. One senator treated the whole subject sarcastically, saying that the Government, after being made bankrupt by carrying letters at home, was going to be enriched beyond all calculation by carrying letters to Europe! He said it was not a new thing to hear of splendid projects by which the Government was to be made rich: he had heard of a project for filling the coffers of the treasury by boiling salt water; there was also a scheme for raising live oak in Florida. He had made a calculation, and had found that for every foot of live oak they would put into their ships they would be out a cubic foot of silver or gold—he did not remember which, but he would stick to the gold.

Postage on letters sent by the ordinary English steamers was twenty-five cents, and in private ships six cents, and of this postage the Government received nothing.

To aid in carrying out the provisions of the act of 1845 Postmaster-General Johnson in the summer of 1847 sent one of his assistants abroad, and he made the first international postal treaty. Under this arrangement the city of Bremen became the transatlantic exchange office for all mails sent by the new ocean line. The rates of postage curtailed one half the previous expense for correspondence, and the results, both social and commercial, were highly important. Under the act of 1845 the Government made a contract for ten years with "The Ocean Steam Navigation Company" for the transportation of the United States mails to Southampton, Havre, and Bremen. The arrangement went into effect in 1848; the sum paid to the company increased from \$100,500 in 1848 to \$200,000 in 1857. On the expiration of this contract, the company being unwilling to continue the service on the terms offered by the Government, the contract was given to Cornelius Vanderbilt, who at this time had three ships out of employment, two of them being the *North Star* and *Ariel*. From 1861 to 1865, inclusive, he conveyed the mails to the Isthmus and South Pacific.

When once the foreign mail service was started, its improvement and development were very rapid. In 1851 a general law was passed authorizing the Postmaster-General to make contracts "for better postal intercourse with

foreign countries," and within the next few years the service was greatly extended. In 1864 Congress passed what was known as "The Compulsory Act," which required steamships bearing the flag of the United States to accept mails from any port in this country, or from any foreign port to the United States. This law was repealed in 1884, the compensation of two cents per letter being strongly objected to by the masters of American vessels, who argued that the basis of payment should be on the number of miles traveled. Under the act of 1885, the Postmaster-General now contracts for the transportation of the foreign mails with the lowest responsible bidder. When the foreign mail service was established, the rate of postage was twenty-four cents per half-ounce. It was gradually reduced until, in 1874, the United States entered into what is known as the "Postal Union," under which postage was fixed at five cents a half-ounce to all countries represented in that body.

One steamship company — the Pacific Mail — is closely connected with the early development of the ocean mail service, and with the progress of our Pacific territory. The corporation was chartered by the New York Legislature in 1848, and at the beginning of its business there was a large and growing passenger traffic between the port of New York and what subsequently became the city of San Francisco. The steamer *California*, which left New York on the 6th of October, 1848, was the first to bear the American flag to the Pacific ocean. The gold crisis made the enterprise very successful for the first few years.

Even as late as 1855 the condition of the foreign mail service presented some remarkable features. At that time a letter destined for Brazil, 4000 miles distant, had to be sent via England, Portugal, the coast of Africa, Madeira, and the Cape Verd Islands, thus traveling 8000 miles, and this, too, in a British packet. One destined for the Pacific coast of South America went to Panama, where it was obliged to await the arrival of an English packet with London letters more recently dated, before it could proceed to Callao, Lima, and Valparaiso. Letters for the West Indies went to Havana only in American steamers, and there they met British vessels which distributed them to the various islands, the Spanish Main, the Guianas, Venezuela, and New Granada. Letters for the continent of Europe went by the Cunard line to England, and thence by English steamers to the British Channel, Baltic Sea, the White Sea, the Mediterranean, Egypt, Constantinople, or the Black Sea. Letters to places along the coast of Africa, and to the Cape of Good Hope were sent by the English packet-ships.

About thirty years ago some of our American economists urged that it was the duty of our Government to establish and maintain an extensive, well-organized, and rapid steam mail marine, for the benefit of production, commerce, diplomacy, defenses, the character of the nation, and the public at large; and that this enterprise should be paid for liberally out of the funds in the national treasury.

In view of some legislation recently suggested in Congress, and to which I will refer further on, it will be interesting to note the arguments made at that time in favor of the scheme. In a condensed form they were as follows:

"We have not established ocean mail facilities commensurate with our national ability and the demands of our commerce; and we are largely dependent on, and tributary to, our greatest commercial rival, Great Britain, for the postal facilities which should be purely national, American, and under our own exclusive control.

"Fast steamers alone can furnish rapid transport to the mails; these steamers cannot rely on freights; sailing vessels will ever carry staple freights at a much lower figure, and quickly enough; while steam is eminently successful in the coasting trade, it cannot possibly be so in the transatlantic freighting business; the rapid transit of the mails, and the slower and more deliberate transport of freight, is the law of nature.

"Ocean mail-steamers cannot live on their own receipts; self-support is not likely to be attained by increasing the size of steamers; the propelling power in fast steamers occupies all of the available space not devoted to passengers and express freight.

"Sailing vessels cannot successfully transport the mails; we cannot, in any sense, depend on the vessels of the navy for the transport of the mails; individual enterprise cannot support fast steamers; not even *American* private enterprise can, under any conditions, furnish a sufficiently rapid steam mail and passenger marine.

"The Government can discharge the clear and unquestionable duty of establishing foreign mail facilities only by paying liberal prices for the transport of the mails for a long term of years, by creating and sustaining an ocean postal system, by legislating upon it systematically, and by abandoning our slavish dependence upon Great Britain."

The legislation proposed some time since, and to which I referred, is a bill reported by Senator Frye from the Committee on Commerce. It provides for ocean mail service between the United States and foreign ports, and is intended to promote commerce. It seems to be similar to the subsidization scheme of thirty years ago and to be recommended on similar grounds.

It provides that the Postmaster-General may make contracts for the carrying of the United States mails in United States ships, owned by American citizens, between United States ports and all foreign ports. He may make the contract for not less than five years', and for not more than ten years', duration. The bill provides for four classes of steamships for which he may contract, the first class being steel ships of a registered tonnage of not less than eight thousand tons, capable of maintaining at sea, in ordinary weather, twenty knots an hour. It provides that only that class of ships shall be used for the transportation of the mails between the United States and Great Britain. A second class of ships is provided for, of not less than five thousand tons' register, and capable of maintaining eighteen knots an hour at sea in ordinary weather. It provides for a third class of fourteen knots an hour, and not less than two thousand tons; and for a fourth class of not less than fifteen hundred tons, which may be of iron, steel, or wood. The pay for the first class is not to exceed \$6.00 a mile, outward-bound voyage; for the second class, \$3.00; for the third class, \$1.50; and for the fourth class, \$1.00. It provides that the vessels heretofore built and contracted for by the Postmaster-General shall first be inspected and receive a certificate of fitness for the service from the Secretary of the Navy; that the first three classes hereafter built shall be constructed according to plans and specifications approved by the Secretary of the Navy; that they shall be of the highest maritime rating known to American or foreign registers; that they shall be capable of sustaining four six-inch guns; and that they shall in all respects be built so as to be converted into auxiliary cruisers for the navy within ten or twenty days, with sufficient strength for all purposes that the navy would require them for. The bill also provides that they shall carry American apprentices as petty officers, one for each one thousand tons; and that they shall educate and train them in seamanship. It provides that they shall carry the mail-messenger of the United States, and furnish him with the necessary accommodations for himself and his mail. The United States, the bill provides, may take the ships whenever they please, paying whatever may be agreed upon, or, if there is a disagreement, whatever impartial appraisers may determine.

Thirty-two years ago the suggestion that the United States should employ vessels in the navy for the ocean mail service was met by the argument (which would probably be equally good at the present time) that such vessels were not adapted for such service; the navy did not require great speed, while the post did. It was also urged at that time that the vessels of the

navy would be weighted down with guns, stores, men, and a thousand things which would be in the way if they were employed for the mails. As they had no accommodations for passengers and freight, they would be deprived of those sources of income, and would have to fall back on the Government for their expenses, which would be very much more than would have to be paid to private companies for carrying the mails.

In my opinion, the proper way to manage the financial part of the ocean postal service is to pay the ships a fair compensation for carrying the mails, the same as we pay the railroads, or to make contracts with them for transporting the mails for certain distances. The British government, for instance, does not grant subsidies, in the general sense of that term, to any steamship company, but the post-office authorities make contracts for the conveyance of mails to different parts of the world with the steamship companies having steamers sailing for those parts. It will be well for us to follow the example of a government whose experience we have for nothing.

The American system of not having any exclusive contracts with steamships of any particular line, and of sending the mail by the first fast steamer, has been found to work successfully, and has received praise from such a conservative English journal as "The Saturday Review." Some months ago that paper complained of the tardiness of the English mail service. The article stated that letters written in London on Sunday rarely arrived in New York more than thirty-six hours before letters written in London on the Saturday six days later. This came about from the giving exclusive contracts for the carrying of the mails. Most of the countries of Europe send their mails to the United States by the fastest steamer offered, without regard to where the vessel hails from. Great Britain, however, despatches its regular mails by the Cunard and White Star lines, sailing from Queenstown. The time required for the conveyance of mails from London to Queenstown is eighteen hours and thirty-five minutes; and from London to Southampton, two hours and forty-five minutes. The North German Lloyd steamers sail from Southampton the same day that the White Star vessels sail from Queenstown, and they arrive at New York before the White Star steamers. More than a day could be saved if the English government followed the American rule. If the German vessels were allowed to convey from Southampton the mails that accumulate after the departure from London of the mails to be sent by the Cunard or White Star vessels from Queenstown, it would not only save the difference in the time required to convey the

mails from London to Queenstown and Southampton, but would advance the despatch of the mails held to be sent by the next Cunard or White Star steamer sailing from Queenstown two days after the German vessel sails from Southampton. Goods coming to the United States by the fast ships are thrown on the dock as unclaimed goods, and are taken possession of by the Government and put into a general-order store, mails containing the bills of lading coming, later on, by the slow ships. All that expense has to be borne by our people simply because the English government is determined to send its mails by a line it wishes to support.

One of the most important postal reforms needed at the present time is a reduction in the rates of ocean postage. I believe I was the first one to advocate publicly this reform, which I did at a banquet given in London in 1883. The suggestion was favorably received by my auditors, among whom were a number of distinguished English statesmen and men of affairs. The London "Telegraph" published a favorable article on the subject, but the suggestion did not meet with the approval of the postal authorities at Washington. On mature reflection, and further examination into the subject, I have not changed my opinion in regard to the need of this reform, and since that time I have publicly advocated it by speech and pen.

Our foreign correspondence has increased wonderfully of late years. During my recent visit abroad, Mr. Rich, the postmaster at Liverpool (one of the ablest post-office officials in the world), told me that he, as a clerk in the British post-office, when a boy, put the foreign mail on board the steamship *Great Western* about the year 1840, and it amounted to two sacks; at the present time it amounts to five or six truck-loads. In 1873, when I was postmaster at New York, the English out-going mail was considered very large if it reached 20,000 letters. At the present time over one hundred thousand foreign letters are sent from New York every sailing day, and nearly the same number are received. The total weight of the mails despatched to foreign countries during the fiscal year ending June 30, 1888, was 643,616 pounds, representing letters and postal cards, and 3,022,992 pounds, representing other articles. The percentage of mail-matter despatched to different countries is represented as follows, the calculation being based on an actual count of the articles contained in the mails, made during two weeks of the year: Great Britain, 51.22; Germany, 20.27; France, 7.60; Italy, 4.41; Norway, 1.44; Switzerland, 2.28; Cuba, 8.67; United States of Colombia, 5.51; Chile, 3.86; Mexico, 2.99.

In my opinion, the letter rate of ocean postage should be reduced to two cents an ounce,

and newspapers and periodicals from the office of publication should be carried for one cent per pound. Under the present system a letter going across the ocean requires a five-cent stamp, or 2½d., English money, the weight of the letter not to exceed half an ounce; for three cents more a letter could be sent all the way from England to Hong Kong. The same high rates apply, relatively, to Germany and other nations on the Continent. We boast of having cheap domestic postage, but notwithstanding the great increase of foreign correspondence, there has been no reduction in the postal rates. We can send a letter from New York to Alaska, a distance of 5000 miles, for two cents, while it costs five cents to forward one from New York to London, a distance of 3000 miles.

I believe, also, that there should be a reduction in the rate on international money-orders. At present it is eight cents on a \$10.00 order, and forty-five cents on a \$100.00 order. These rates should be reduced one half. Dr. C. F. MacDonald, Superintendent of the Money-Order System, has recommended the increase of the maximum amount of a single international money-order from \$50.00 to \$100.00. Such a change would produce uniformity in respect to the maximum amount between the domestic and the international money-order, and would, besides, tend to reduce the expenses of the international money-order system, inasmuch as for sums from \$50.00 to \$100.00 a single order would be required in lieu of two, as at present. Since the postmasters and clerks who issue the orders, and the exchange officers who certify them, are compensated for their labor, not upon the basis of the amounts of the orders, but upon that of the number of transactions at a fixed rate per transaction, the lessening of expense in the item of clerk-hire in post-offices would be by no means inconsiderable. There is a steady increase in this branch of the Government's business.

The ocean mail service has been greatly improved during the past year. The sea post-offices established on the steamers of the North German Lloyd, between New York and Bremen, and on those of the Hamburg-American Packet Company, between New York and Hamburg, have been a great success. Incoming foreign mail is now received from two hours to a week sooner than it used to be. Postmaster-General Wanamaker has not been able, however, to complete a similar arrangement with the Post-Office Department of Great Britain, though the owners of the White Star and Inman steamships were in favor of the change.

In England, at the present time, there is a strong effort being made in favor of universal international penny-postage. The Hon. J.

Henniker Heaton, M. P. for Canterbury, is at the head of this movement ; he recently visited the United States, with the view of interesting some of our leading officials and public men in the proposed reform.¹ Mr. Heaton takes the ground that the state has no right to make a profit out of the post-office. So much of the business life of the community, he says, is now dependent on the postal service that a large part of the postal revenue is derived from a tax on the machinery of trade, while another large part of the revenue is taken from the poorest class of citizens who are obliged to use the mails. He says he can understand the state charging a tax of sixpence a ton on coals actually sold, but he cannot understand a tax of sixpence on the correspondence leading to that business transaction. The state should encourage those operations of commerce which ultimately furnish work to English workers, and thus benefit the entire community. A reduction in the cost of postage would be a benefit to the entire community, and would reap a harvest of universal gratitude. It is also urged that penny-postage would promote a more brotherly feeling between the mother-country and the millions of Englishmen dwelling in her colonies, and would also tend to avert the wars which so frequently disgrace humanity, because the people of countries in constant communication would be less likely to quarrel than those which remain in savage isolation.

In this connection it may be said that the present Postmaster-General of Great Britain,

Sir James Ferguson, has steadily opposed the ocean penny-postage scheme as it has been presented from time to time by Mr. Henniker Heaton and his followers. This is not surprising when we recall the fact that the postal reforms of the great Rowland Hill were opposed, not only by the officials of his day, but by some of the most prominent men of the period, including the witty Rev. Sydney Smith.

One of the London weeklies (I think the "Echo"), not long since, in commenting on the dullness of the postal officials to appreciate this valuable reform, observed that the only thing to do was to "keep pegging away," and, in the course of time, as experience had shown, even the official mind, adamant though it might be at the outset, would succumb to the continued effort that had been made upon it.

Many improvements have been made in our domestic postal service during the last few years. Every now and then we hear of the proposition to reduce the rate of postage on domestic letters to one cent, to make use of the pneumatic tube or some similar underground system of transportation in our larger cities, and to introduce the free-delivery system into our smaller towns and villages. These suggestions are very good in their way, but it would seem as though the reform most needed at the present time is a reduction in the rates of ocean postage. With a growing public sentiment, both in England and in the United States, in favor of such a change, it will not be long before it will be brought about.

*Thomas L. James.*²

¹ In a letter to "The New York Times," published in January last, the interesting statement is made that "Mr. Henniker Heaton has just made an important offer to Mr. George J. Goschen, Chancellor of the Exchequer, which, if accepted, will institute an ocean penny-postage. Mr. Heaton, with two friends, an Australian millionaire and an English capitalist, has offered to guarantee the British government against all loss if a penny-postage be established between the English-speaking peoples of the British Empire and the United States of America.

The probable loss was estimated by Mr. Goschen himself at £75,000 per annum, but Mr. Heaton maintains that the loss would not extend over more than three years, and that after that ocean penny-postage would make a profit, as has been the case with the inland penny-postage. Mr. Goschen says the Government cannot accept Mr. Heaton's offer. The latter will bring the matter before Parliament."

² In the preparation of this article I have had the assistance of Mr. George J. Manson.

THE CYCLAMEN.

OVER the plains where Persian hosts
Laid down their lives for glory
Flutter the cyclamens, like ghosts
That witness to their story.
Oh, fair! Oh, white! Oh, pure as snow!
On countless graves how sweet they grow!

Or crimson, like the cruel wounds
From which the life-blood, flowing,
Poured out where now on grassy mounds
The low, soft winds are blowing;
Oh, fair! Oh, red! Like blood of slain;
Not even time can cleanse that stain.

But when my dear these blossoms holds,
All loveliness her dower,
All woe and joy the past enfolds
In her find fullest flower.
Oh, fair! Oh, pure! Oh, white and red!
If she but live, what are the dead!

Arlo Bates.

TOPICS OF THE TIME.

The First Presidential Election Under Ballot Reform.

THE presidential election of this year will be the first one in the history of the country to be decided by a secret ballot. Three quarters of all the States will cast their vote in that election in accordance with some form of the Australian system, and these three quarters include the most powerful States in all sections except the South. They include all the New England and Middle States, and all the Western and Northwestern States except Iowa, Kansas, Nevada, and Idaho. Four Southern States will have the system in operation this year,—Arkansas, Tennessee, Mississippi, and West Virginia,—and Kentucky and Texas have adopted constitutions directing their legislatures to enact laws embodying its principles. Seven Southern States have, for some inexplicable reason, failed to realize the value of a reform which is of even greater importance to the South than it is to any other part of the Union.

The fact that all the so-called "doubtful" States, whose vote is decisive in the election, are to cast their ballots in absolute secrecy, free from all espionage and intimidation, is one of momentous importance. The first and inevitable effect will be to lessen enormously the part which money will play in the contest. Every State in which money has heretofore been used most freely has adopted the new system. If votes be bought in those States hereafter, the purchasers cannot follow the men whom they have bought to the polls to see if they keep their bad bargain. The result will be the same in those States as it has been everywhere, else under similar conditions; namely, very few votes will be bought.

This is a novel phase of a presidential canvass and election which both political parties will do well to take into consideration in selecting their campaign managers for this year. If money is no longer to be the controlling factor in the election, will it be either expedient or wise to put a professional corruptionist in charge of the campaign of either party? On the contrary, will it not be the highest political wisdom to put men of character in charge of all the committees, national, State, district, and other? Surely the time has come when such a change is most earnestly to be desired. Everybody admitted at the close of the last presidential campaign that money had been used upon both sides with a profusion never before seen in this country. There was no concealment of the fact. Both campaign committees admitted that they had used large sums, but that each had been compelled to do so by the lavish outlays of the other. Indeed, for several years past the absolute necessity for getting skilled corruptionists to take charge of campaign work has been argued with great plausibility on the ground that for one party not to do it would be simply to let the other party's corruptionist win the battle without a struggle. "We must fight the devil with fire" has been the excuse on both sides, and the fire has been supplied with a recklessness and an abundance which aroused the conscience of the whole country, and did more than anything else to create the popular sentiment in favor of ballot re-

form which has led to the enactment of the twenty-nine laws of to-day.

These laws are certain to operate here in the same beneficent way in which they operated in England. They did not stop all extravagant use of money in elections, but they did put a stop to bribery. Mr. Joseph Chamberlain, when in this country at the time our ballot-reform agitation was beginning, said of the operation of the Australian system in England: "In my opinion there is at the present moment exceedingly little electoral bribery and corruption in the United Kingdom. The elections are singularly pure, and are daily, if it were possible, improving in that respect. Corruption, indeed, is almost an impossibility, owing to the fact that the briber is absolutely dependent upon the bribe-taker's observance of the motto 'Honor among thieves,' for the briber has no means of ascertaining how the latter votes." Yet before the English law went into effect bribery was more open than, and its general practice had reached proportions far in excess of, anything ever seen here.

In England they did not stop with legislation making bribery unprofitable because of the impossibility of seeing the goods delivered, but they went a step further, and forbade extravagant expenditures of all kinds in elections by limiting the amount of money each candidate should be allowed to spend, and requiring him to publish a sworn account of all his expenditures. They made this the corollary of their ballot-reform legislation, and we must do the same thing here before we can stop the undue use of money in elections. The English Corrupt Practices Act, to which we have had occasion to refer many times, was passed by Parliament in 1883. It forbade the undue use of money and influence in every conceivable way, and fixed a maximum limit for all expenditures, requiring the sworn publication after election of every penny spent. When it was under discussion it was constantly predicted that it must fail of its purpose because the evils complained of were not such as could be reached by legislation, and the opinion was almost universal that the maximum limits of expenditure were far too low. Yet it was a complete success at its first trial, and practically abolished corruption in English politics at a single blow. When the grand total of expenditures in the election had been footed up, it was discovered that it was only a little more than one half of the grand total allowed by the law, so that, instead of being too low, the maximum limits were at least a third higher than they needed to be. This demonstration has been repeated in every subsequent election. When one candidate does not bribe, his opponent has no incentive to outbid him; and the result is that elections are not only decided on the merits of the candidates as they appear to the uninfluenced judgment of the electors, but they are so cheap that the poor man has equal chance with the rich as a candidate.

Does anybody doubt that if we had a law in this country fixing maximum limits for the expenditures in behalf of all candidates from aldermanic to presidential, and requiring sworn publication of all expenditures

after election, that the profuse use of money in elections would not be stopped at once upon the law's going into effect? Sworn publicity by itself would be almost a complete cure. If both campaign committees in 1888 had made their expenditures with the knowledge that at the end of their work they would be required to make public, under oath, a full statement of all the money they had received and spent, would not the outlay have been much less than it was?

We have, by passing ballot-reform laws, made the use of money for bribery difficult if not impossible, and have, therefore, cut off one of the avenues for large expenditures; but we must not stop there. So long as extravagant expenditures are permitted, they will be made. Our experience is like that of all other nations. There has never been a government under which the rich have not bought votes and the poor have not sold them, provided the law permitted such bargains to be made in secret. The American people are as jealous in the care of the moral health of their political system as other nations have been, and now that they have taken the first step toward abolishing corruption from their elections, they will be certain to take the second at an early day. In the mean time the political managers will do well to make a note of the fact that money is certain to play a less important, and reason and argument a more important, part in the campaign of 1892 than in those of its immediate predecessors, and select their campaign directors with this end in view. They can rest assured, furthermore, that the people are not in a mood to view with complacency the selection of a professional corruptionist to conduct the campaign of either party,—much less the nomination by any party of a notoriously corrupt politician as a candidate for the presidency,—though in these latter days such men have dared to attempt to juggle even the presidency into their pockets.

The New Electoral College.

UNDER the new Apportionment Act the Electoral College in the next presidential election will consist of 444 members, and 223 votes will be necessary to elect. This is an increase of 43 over the Electoral College of 1888, of which 23 come from enlarged representation in 17 old States, and 20 from the admission into the Union of six new States. We give in the following table the old and new apportionment for each State, the old States being divided between the two parties as they voted in the last presidential election:

Republican.			Democratic.		
New ap. Old ap.			New ap. Old ap.		
California.....	9.....8		Alabama.....	11.....10	
Colorado.....	4.....3		Arkansas.....	8.....7	
Illinois.....	24.....22		Connecticut.....	6.....6	
Indiana.....	15.....15		Delaware.....	3.....3

NEW STATES.

Idaho.....	3
Montana.....	3
North Dakota.....	3
South Dakota.....	4
Washington.....	4
Wyoming.....	3
Total.....	20

If we divide the States, old and new, according as they have voted in the most recent elections since 1888, some of which occurred in 1890 and others in 1891, we shall arrive at the following result:

Republican.		Democratic.	
California.....	9	Alabama.....	11
Colorado.....	4	Arkansas.....	8
Idaho.....	3	Connecticut.....	6
Illinois.....	24	Delaware.....	3
Kansas.....	10	Florida.....	4
Maine.....	6	Georgia.....	13
Michigan.....	10	Indiana.....	15
Minnesota.....	9	Iowa.....	13
Montana.....	3	Kentucky.....	13
Nebraska.....	8	Louisiana.....	8
Nevada.....	3	Maryland.....	8
New Hampshire.....	4	Massachusetts.....	15
North Dakota.....	3	Michigan.....	4
Ohio.....	23	Mississippi.....	9
Oregon.....	4	Missouri.....	17
Pennsylvania.....	32	New Jersey.....	10
Rhode Island.....	4	New York.....	36
South Dakota.....	4	North Carolina.....	11
Vermont.....	4	South Carolina.....	9
Washington.....	4	Tennessee.....	12
Wisconsin.....	12	Texas.....	15
Wyoming.....	3	Virginia.....	12
Total.....	186	West Virginia.....	6
		Total.....	258

In this compilation Massachusetts, Iowa, and New York are placed in the Democratic column because each of those States has been carried by the Democrats in two successive elections since 1888. Indiana is placed there because the Democrats carried it by nearly 20,000 majority in 1890. Michigan is placed in both columns because twelve of her fourteen electors are to be chosen this year by congressional districts, and two by the State at large. It is conceded that at least four of them will be elected by the Democrats, and we have put that number in the Democratic column.

While making this division on the basis of elections held since 1888, we do not for a moment wish to appear as assuming that the result of this year's presidential contest is foreshadowed by it. There are several States usually and rightly classified as "doubtful" which in this division are placed in the Democratic column. There are also at least two others which have hitherto been regarded as safely Republican in presidential elections. The "doubtful" States are Connecticut, Indiana, and New York, and the States hitherto classed as Republican are Iowa and Massachusetts. All the twenty-two States in the Republican column have hitherto been regarded as surely Republican, with the exception of Montana, and possibly New Hampshire and Rhode Island. As the Republican column stands, its total of 186 votes, 37 less than enough to elect, may be taken as representing fairly the number of absolutely "sure" Republican votes. If now we take from the Democratic column the 57 votes of the three "doubtful" States, and the 28 votes of Massachusetts and Iowa, we reduce the Democratic total to 173, or 50 short of a majority in the college, which may be taken as representing fairly the number of absolutely "sure" Democratic votes.

There are several interesting combinations which can be made with these "sure" totals as bases. First, as to the Republican side. Here are four :

Sure Republican votes	186
New York	36
Connecticut	6
Total	228

Sure Republican votes	186
Massachusetts	15
Iowa	13
Indiana	15
Total	229

Sure Republican votes	186
New York	36
Iowa	13
Total	235

Sure Republican votes	186
New York	36
Massachusetts or Indiana	15
Total	237

All these combinations are on a basis of ten Republican votes from Michigan. If there were to be eleven, this combination, giving precisely a majority of the college, could be made :

Sure Republican votes	187
New York	36
Total	223

Turning next to the Democratic column, we can arrange the following :

Sure Democratic votes	173
New York	36
Indiana or Massachusetts	15
Total	224

Sure Democratic votes	173
New York	36
Iowa	13
Connecticut	6
Total	228

These are arranged on the basis of four Democratic votes from Michigan. If the number from that State be raised to five, the following can be made :

Sure Democratic votes	174
Massachusetts	15
Indiana	15
Iowa	13
Connecticut	6
Total	223

The first point which will strike every observer of these various combinations is the overwhelming importance of the thirty-six votes of the State of New York. It is as true now as it has been for many years that the party which carries that State has by far the better chance of winning the election. The admission of the six new States with their twenty electoral votes, all supposed to be safely Republican, has diminished somewhat the importance of New York to the Republicans ; that is to say, they have more chances for winning without New York than they have had hitherto, and more chances than the Democrats have for winning without it : but, as our combinations show, they will have to carry all the States of Iowa, Massachusetts, and Indiana in order to accomplish that feat. As for the Democrats, it is difficult to escape the conclusion that New York is a *sine qua non* for them. With that and Indiana or Massachusetts they can win, or they can win with it together with Iowa and Connecticut ; but it is very difficult to make a combination by which they can win without it, unless we were to count Montana among the "doubtful" States and give them a chance at that, or, as our final combination shows, give them one more vote in Michigan than is usually allotted to them.

The importance of Michigan with its divided vote is second only to that of New York with its largest total in the list. This is made apparent by our final combination in each set, for it is there shown that the change of one vote from one side to the other in Michigan may enable either party to elect a President.

OPEN LETTERS.

The Yankee and Rebel Yells.

ALL organized bodies of men, whether civilized or savage, while engaged in desperate deeds, and every army from the days of Pharaoh to the present moment, have probably had their peculiar yell or cheer, a vocal outburst natural to the people represented. The potent or determining influence which yells, vigorous and enthusiastic, or weak and heartless, may have had from time to time in turning the tide of battle, whether in securing victories or in causing defeats, is an unwritten element or force in war which the historian has greatly if not totally neglected.

It is certainly safe to say, other things being equal, that the body of men or the army exhibiting the greatest amount of enthusiasm, even though its numbers may be decidedly inferior, will possess a marked advantage over its antagonist. Hence to awaken spirit, determination, and dash in his troops at the moment of a charge, is the

earnest desire of every commanding officer. To secure this end, when no secrecy is required, a bold, defiant "yell" is of the greatest value, not only in its effect upon the command in action, but also in the depressing influence which may be produced upon the enemy.

It would be interesting indeed to know the old Roman and Grecian yells, their tone, spirit, and vocal range ; but this the historian has left to our imagination. The same may also be said, so far as I am aware, of the English, French, German, and Russian yells or cheers, for we read and hear but little or nothing of their existence or of their influence in battle.

During and since our late war the "Rebel" and "Yankee" yells have been frequently referred to, but their true character and essential differences, with reasons for the differences, have not, so far as I know, been clearly presented.

I was recently asked to say something upon this subject before the society of "The Virginians" on the

occasion of its annual banquet in New York, and the following is the substance of what was then stated.

There is a natural tendency in the minds of most men, as they move onward along the "River of Time," to forget, or in a great measure to obliterate from their memories, unpleasant things, and, on the contrary, to recall and treasure those that have contributed to their joys, comforts, and successes. With no one is this peculiarity more marked than with the old soldier. When he talks of his war experiences, it will constantly be found that his trials, privations, discomforts, and disappointments, have been largely forgotten or overshadowed by the memory of his comrades, of social gatherings around the camp-fires, of songs that were sung and stories told, of adventures and narrow escapes, of battles lost and victories won.

Among the incidents of active service there were probably no events more thrilling and more exciting to the soldier than those of a charge, for in its dash there were displayed not only the boldness and the fury of the occasion, but, of necessity, much of the savagery of war.

It was in the charge that the "war-whoop" was heard, the savage "yell" with which men wild in battle endeavored to send terror to the minds of their enemies.

Each foe, in every clash of arms, sought to arouse all of the military energy, the enthusiastic vigor, the martial spirit, and the determined endeavor, which could possibly impress upon its enemy the overwhelming force with which its charge or its resistance was made, and no feature added more to the accomplishment of this purpose than the enthusiasm of the yell.

I was a member of the Ninth Virginia Cavalry, a follower of Stuart and his successors, and on many a well-fought field I have seen, listened to, and participated in charge after charge. The defenders of old Virginia were not by any means successful at all times in defeating their adversaries, and not infrequently by force of circumstances were induced to take their turn in a more or less graceful "skedaddle." Whenever I was one of the "skedaddling corps," I found some consolation in recalling a little family incident.

My grandfather was an officer in the war of 1812. Once in his old age, while relating to a number of his grandchildren gathered around him some of his experiences in war, he told of an encounter with the British in which his troops were forced to retreat in decided haste. One of the little boys who had been listening, with his mouth agape, no doubt, in the intensity of his interest, asked, "And, grandpop, did you run?" The old man replied, "Ah, yes, my child; and braver men than your grandfather ran that day."

That there existed a marked difference between the yells of the opposing armies during our late war was a recognized fact, and a frequent source of comment. The notes and tones peculiar to each of them were well defined, and led to their designation as the "Yankee" and the "Rebel" yells. It is interesting to note some of the reasons why they differed so widely.

Southerners have always been recognized by those who have known them best as a people possessed of unbounded enthusiasm and ardor. They have been considered and often called a "hot-headed," a "hot-blooded," people. Among the rank and file, as well as among the officers, of the Confederate armies, were

to be found men of intelligence, birth, position, and distinction in the communities in which they lived; men in whose veins ran the invigorating blood of the noblest ancestry; men who were proud in peace, courageous and fearless in war.

These peculiarities of birth, character, and temperament, coupled with the fact that they were chiefly an agricultural people inhabiting a broad expanse of country but thinly settled, and confined in no large numbers (comparatively) to the narrow limits that city and town life impose, had much to do with the development of their soldierly qualities as well as of their capacity for yelling.

Life in the country, especially in our Southern country, where people lived far apart and were employed oftentimes at a considerable distance from one another, and from the houses or homes in which they ate and slept, tended, by exercise in communicating with one another, to strengthen and improve their voices for high and prolonged notes. A wider range to the vocal sounds was constantly afforded and frequently required.

The voices of women as well as of men were often utilized for "long-distance calls." It may be amusing to note the difference in intonation which was usually exhibited by the sexes. When a man had occasion to summon any one from a distance, the prolonged tone was placed on the first note, the emphasis on the second; thus, "O—h, John!" If a female called, the prolonged tone and the emphasis were both placed on the last note; thus, "You, John—n—y'!"

Hollering, screaming, yelling for one person or another, to their dogs, or at some of the cattle on the plantation, with the accompanying reverberations from hilltops, over valleys and plains, were familiar sounds throughout the farming districts of the South in the days gone by. It used to be said of my father's old negro foreman that he could be distinctly understood a mile or more away.

Hunting, which was enjoyed and indulged in more or less by nearly every citizen of the South, was also conducive to this characteristic development.

I remember an amusing instance illustrative of this point. I was out on one occasion before the war with a party of gentlemen hare-hunting with hounds. No guns were allowed. I had taken with me a very bright and intelligent little negro boy, who had become for a time separated from me. Later, while the dogs were chasing the hare from thicket to thicket, from meadow to woods, I came to a small open space surrounded by "old-field pines," and "broom-sedge" which had been cultivated in corn during the previous season. There, in the sunshine, unconscious of the presence of any one, sat the little darky packing damp sand over his foot, and withdrawing it—building what the boys called "frog-houses." Just then one of the huntsmen saw the hare, and gave a most vigorous vocal outburst, yelling for the dogs, "Here—here, here—here, here—here!" etc., endeavoring to place them still closer in pursuit. The little negro, without removing his eyes from the work with which he was occupied, simply uttered a most significant comment; he exclaimed, "Humph! Good gracious! dat man certainly kin holler."

The Federal, or "Yankee," yell, compared with that of the Confederate, lacked in vocal breadth, pitch, and resonance. This was unquestionably attributable to the fact that the soldiery of the North was drawn and re-

cruited chiefly from large cities and towns, from factory districts, and from the more densely settled portions of the country.

Their surroundings, their circumstances of life and employment, had the effect of molding the character and temperament of the people, and at the same time of restraining their vocal development. People living and working in close proximity to one another have no absolute need for loud or strained vocal efforts, and any screaming or prolonged calling becomes seriously annoying to neighbors. Consequently, all such liberties or inconsiderate indulgences in cities, towns, etc., have long ago been discouraged by common consent.

It is safe to say that there are thousands upon thousands of men in the large cities, and in other densely populated portions of the North, who have not elevated their vocal tones to within anything like their full capacity since the days of their boyhood, and many not even then.

To afford some idea of the difference between these "yells," I will relate an incident which occurred in battle on the plains at Brandy Station, Virginia, in the fall of 1863. Our command was in full pursuit of a portion of Kilpatrick's cavalry. We soon approached their reserves (ours some distance behind), and found ourselves facing a battery of artillery with a regiment of cavalry drawn up on each side. A point of woods projected to the left of their position. We were ordered to move by the right flank till the woods protected us from the battery, and then, in open field, within a few hundred yards of the enemy, we were ordered to halt and right dress.

In a moment more one of the Federal regiments was ordered to charge, and down they came upon us in a body two or three times outnumbering ours. Then was heard their peculiar characteristic yell — "Hoo-ray! Hoo-ray! Hoo-ray!" etc. (This yell was called by the Federals a "cheer," and was intended for the word "hurrah," but that pronunciation I never heard in a charge. The sound was as though the first syllable, if heard at all, was "hoo," uttered with an exceedingly short, low, and indistinct tone, and the second was "ray," yelled with a long and high tone slightly deflecting at its termination. In many instances the yell seemed to be the simple interjection "heigh," rendered with the same tone which was given to "ray.")

Our command was alone in the field, and it seemed impossible for us to withstand the coming shock; but our commander, as brave an officer as ever drew a saber, frequently repeated, as the charging column approached us, his precautionary orders, to "Keep steady, boys! Keep steady!" and so we remained till the Federals were within a hundred yards of us. Then, waving his sword in air, he gave the final order, loud enough to be heard the field over: "Now is your time, boys! Give them the saber! Charge them, men! Charge!"

In an instant every voice with one accord vigorously shouted that "Rebel yell," which was so often heard on the field of battle. "Woh-who—ey! who—ey! who—ey! Woh-who—ey! who-ey!" etc. (The best illustration of this "true yell" which can be given the reader is by spelling it as above, with directions to sound the first syllable "woh" short and low, and the second "who" with a very high and prolonged note deflecting upon the third syllable "ey.")

A moment or two later the Federal column wavered and broke. In pursuit we chased them to within twenty feet of their battery, which had already begun to retreat. The second regiment to the right and rear of the battery then charged upon us, and for a moment we were forced back; but by that time our reserves were up, and we swept the field.

In conclusion, let us rejoice in the fact that war and its incidental accompaniments are with us only in memory, and let us hope for our loved country, and for ourselves, that peace, happiness, and prosperity will dwell with us and our children's children now and evermore.

J. Harvie Dew.

Is Islam the Gospel for the Orient?

THAT command which Mohammed seemed to himself to hear in the depths of his serious and brooding soul, "Cry, cry, in the name of Allah!" and which he interpreted as the voice of the angel Gabriel, introduces us to a veritable dreamland of history. It is not, however, a land of dreams; rather of realities which have thrilled and torn the world, and strained the religious, social, and political systems of men as with the throes of revolution. The good sword of Christendom never struck more telling blows than at Tours and Vienna, when it dashed to the earth the Damascus blades of the Saracen and Turkish invaders sweeping into central Europe. Who could picture the course of history had the result been different? Who can estimate the world's indebtedness to Charles Martel and Sobieski, and to the brave men who fought with them for the rescue of humanity from the Koran, the crescent, and the harem — the symbols of religious, political, and social degradation? Who can write this story of Islam as it throbs and glows in Eastern history? Who can solve this mystery of God and Mohammed? Who can explain the genesis and the historic mission of this cry of the desert, which has closed ancient schools of philosophy, and held as in chains the sensuous tastes and the wildly idolatrous trend of the fervid East by the simple creed and the stern practice of a severe religious discipline? The history of Islam as a religion, and the story of its mysterious sway, are yet to be written by some master in the science of comparative religion whose spirit shall be taught of God, and who shall bring to the task both genius and patience in Oriental research. He must be able to read history between the lines of romance, separate sober fact from garrulous tradition, trace back the streams of Islamic thought to their hidden fountains in the desert, and push aside the tangled overgrowth from sources, long since dry, which once gave forth their brackish waters to those who perchance were searching the barren wilderness for the purer and sweeter springs of life.

The thought of our time seems ripening for such a true and exact estimate of Islam. A kindly and generous but firm and inflexible judgment upon this historic problem is rapidly forming. Islam shall have all the credit it deserves; it shall be treated with fairness and calmness and courtesy: but never can it have the place of supremacy it claims; it can never even share the honors of Christianity; nor can it presume to be her handmaid in the regeneration of the East. It has done its work, and left its stamp upon the Orient. Its record is of the earth, earthly, although it has cried and fought

in the name of Allah. Its fountainhead is in the depths of the Arabian wilderness; it has flowed only in human channels; it has hardly risen above the ordinary level of religious standards in the Orient; its ethical and social code is only the rude and vulgar heritage of the desert. Its doctrine of one God, while it is the secret of its power and explains to a large extent its magic sway, has not saved it. It has given dignity and nobility to the Moslem creed; but a closer scrutiny reveals the broken, distorted, and inferior representation of the ineffable character of God which we have in Islam. It is God environed with human interpretations, modifications, and readjustments to meet the religious and social requirements of the East as understood by a representative Oriental. The Deity is made to sanction what he loathes, and to command a whole system of human formalism. The difference between the Bible and the Koran is the difference between the divine and the human.

What shall we say, then, of the mission of Islam? What is its significance as a factor in the religious history of the world? Why was it so quickly recognized, and so readily admitted to the place of power it has held in human affairs? What has it done for mankind? It has at least saved the Orient from atheism, and has taught men to bow in prayer, and has nourished generations in the exercise of faith. It has staggered idolatry by a crushing blow throughout all of western Asia and northern Africa. It has been, moreover, a disciplinary dispensation to the priestly pretensions and the idolatrous practices of apostate Christianity. The Eastern world seemed to have rushed headlong into the vortex of idolatry, and had lured Christianity to her fatal lapse. Centuries must pass in the ordinary course of history before the dawn of a spiritual reformation could be expected in the East. Shall idolatry, pagan and Christian, be left, meanwhile, to riot in the ancient seats of Jewish monotheism? Shall the lands which have known "one God" know him no more forever? A fervid cry is wafted from the depths of the Arabian wilderness: "There is no god but God"—alas! that there were added the fatal words—"and Mohammed is the prophet of God." Yet Islam is immeasurably better than idolatry, and has truly a noble message and a high mission. The world shall learn what superb energy and resistless power lie wrapped in the potent principle of faith in God, even though a human teacher be its only leader, and its path is in the mirage of Mohammed's Koran. Idolatry shall be overthrown in the high places of its power, and unhappy Christianity must sit in sorrow and humiliation within the shadow of her defiled shrines, beneath her pictures and images, until the time of her deliverance shall come. Such was the decree and purpose of Providence. Such is the verdict of history.

Islam is thus a rebuke and a check to idolatry until a spiritual era shall dawn. It has comforted many a devout heart, and nourished the religious instincts of the East with its supreme and unfaltering allegiance to one supreme God: but, alas! it has thrust a human hero into the place of the Son of God; it has compromised with man's lower nature in its moral standards; it has simply given a religious sanction to the code of the desert; it has collected the odds and ends of Talmudic Judaism, of travestied Christianity, and barbaric heathenism, and has patched up a religion which, while

it claims to teach men in the name of God, is simply a strange and childish medley of God and Mohammed, of truth and trash, of simple faith and rank superstition, of high aims and reckless abandon. Never was there a more bewildering blunder in spiritual discernment, or a more astounding eccentricity in religious opinion, than that which has so recently striven to indorse Islam as a religion which is worthy of a place by the side of Christianity, as a helpful and uplifting power in the world's regeneration. The Christian sense of the age and the civilized self-respect of Christendom have united in an indignant protest.

Islam, however, is not simply a thing of the past, a relic which we dig up from the prolific dust of those ancient seats of Asiatic power. Islam is here; it is of the nineteenth century; it is a power in our generation; it is something to be studied and understood. It is a political factor in the Eastern question of the very first magnitude. What becomes at once, when opened, the "burning question of the straits" is usually at first the flash of Islamic fanaticism amidst the inflammable religious elements of the Levant. The government of Turkey has pledged itself to Europe again and again as guaranteeing absolute religious toleration and freedom; but let a Moslem attempt to claim his liberty of conscience to embrace Christianity, and before the ink is dry his doom is sealed. America, to be sure, has little concern with the politics of Europe; but American Christianity has a high mission and a noble field amidst the intellectual and spiritual struggles of down-trodden peoples. Her mission is one of sympathy, and help, and active philanthropy. An Arabic figure of speech designates a helpful and gracious ministry as something done by a "white hand." American Christianity is reaching out her "white hand" of beneficence to the nations of the Orient. She has already carried to the teeming centers of Asiatic life some of the highest and most helpful elements of our civilization, and is grafting into the intellectual and spiritual movements of the Old World that power which "makes for righteousness," which both sweetens and glorifies human life, and gives it its noblest possible impulse and its highest possible destiny. There must be no "Monroe doctrine" in our American Christianity, bidding us hold aloof from this "white-handed" ministry to those who need so sorely the help of the favored nation whose happy lot has fallen under the light of the "westward star"—a star which, we must not forget, first arose in the East.

America can do much, by wise effort, and cordial sympathy, and watchful interest, to establish throughout the world the precious principle of religious freedom. Her whole influence should be thrown on the side of religious toleration and liberty of conscience. This is a lesson yet to be learned by almost the entire Eastern world. The glow of American sympathy is to-day doing wonders for whole nations in the Orient. American philanthropy has already planted six colleges and seven hundred schools in the Turkish empire. Every prominent language of the East is throbbing with American literary and religious contributions. American missionaries have within a generation given the Word of God to Eastern peoples outnumbering many times over the population of the United States.

Let American hearts be interested in the welfare of Oriental nations, and enlisted in their behalf in the

high services of human brotherhood. An example of national unselfishness as wide as the world and as deep as human want is yet to be given to men. Let America crown her greatness with the beauty and power of this example.

James S. Dennis.

Dr. Weir Mitchell's "A Psalm of Death and other Poems."

A MINOR poet shares with the greatest the privilege of being unequal to himself: some moods are more fitted to his power of expression, some forms are more adequate to his limited art, some phases of thought or action appeal more to his personality; and thus it occasionally happens that he writes above himself. The critic finds in such cases an opportunity, and may do a friendly service to literature by attracting attention to these rare single poems which seldom pass, even when of high excellence, beyond a cultivated and narrow circle. Dr. Weir Mitchell has written more than one volume that has been welcome to lovers of poetry for somewhat unusual qualities in minor verse, and in particular for some few single poems that stand out from the rest. Generally these contain a dramatic element, though the form may be lyric or narrative or, perhaps, ballad. His readers may remember such an instance in the vigorous masque of the miser, with its humorous ending, so much more effective in the original poem than was the prolonged tragic ending which encumbered it, and destroyed its best quality, when it was put upon the stage two winters ago. In a recent volume which Dr. Mitchell has published, "A Psalm of Death, and other Poems,"¹ there is an even finer dramatic poem, which has drawn so little notice as to make the fact a discouraging sign of our lack either of interest or of perception in these matters. Much else in this collection deserves a word of recognition—the sentiment for nature developed by attachment to particular places, a ballad of adventure that interests the imagination, and among a few pieces, which the author somewhat unhappily calls psalms, one sharply touched by that sympathy with physical pain which is usually vague but here is real and definite as science itself, and yet is kept within the bounds of art. All these have their merit; but this dramatic piece already mentioned excels them so far as to be of a different class and to deserve praise of a higher kind. "Master François Villon" is its title—a dialogue between two French nobles. The characterization of each of the speakers is complete, and affords a contrast, but the dramatic power of the author is felt more in the story which one tells to the other, and which concerns Villon. The skilful blending of several interests helps the variety of the matter, and the way in which the narrator unconsciously is made to reveal his own nature is admirable literary irony, while the comic element and a certain sparkle of wit and epigram affect the style without controlling it. The story itself, however, is apart from these literary traits, and is an expression of the charm of the poetic nature in Villon, worked out by well-chosen circumstances; the author has shown

the poet in Villon rising like another self out of the sot he was—the flame burning in the swamp. It is an altogether exceptional poem in our current literature, original, imaginative, vital, with both beauty of expression and energy in the movement. The very short and simple annals of our present-day verse cannot well spare work of such distinction, and it is a pleasure to direct lovers of strong and well-turned verse where such an estray lies hidden.

George E. Woodberry.

Aërial Navigation.

SINCE my article on "Aërial Navigation. The Power Required" appeared in the October number of your magazine, I have received a large number of letters on the subject. Those received from France and England have been of a congratulatory character, while two written in the United States have been of a depreciatory character.

The apparatus described and shown in my article was not intended as a complete flying-machine, as some of your readers seem to imagine. It is simply an apparatus which I designed and constructed for the sole purpose of ascertaining how much power was actually required to perform flight with a screw-driven *aéroplane*.

The apparatus was provided with every requisite for accurately determining the energy required, and furnished me with data which I could not obtain at that time from any other source. My article related wholly to this apparatus.

Some of your readers lay great stress upon the impossibility of such a machine moving straight through the air, saying that it would be quite impossible to preserve the angle of the plane as relates to the earth's surface, or to anything else, and if the machine was cut loose from the arm that guided it around the circle, it would run up a steep incline and fall back to the ground. This might be true of the apparatus shown.

In the machine which I am building, and which is intended for free flight, the most intricate part of the whole thing is the apparatus for keeping the machine on an even keel while flying. This apparatus does for the machine what the brain does for the bird. The least deflection from a predetermined angle instantly applies an enormous amount of energy to the planes of the machine, changing the angles of some in order to maintain the angles of others.

The machine consists of one very large plane with smaller ones attached to it. I do not anticipate any insurmountable trouble in the direction of maintaining the principal plane of my machine at any angle desired. My apprehensions at the present time are altogether of another kind: Will my engines be strong enough?

With the data and formulæ which I have at hand, it would appear that they are, and with a large margin of energy to spare; but the machine is very much larger than any that has ever been made before, and possibly there may be another and an unknown factor—the factor of size.

Yours truly,

Hiram S. Maxim.

DAKOTA SKETCHES.

WITH PICTURES BY E. W. KEMBLE.

The Dakota Bachelor.

[THE homestead country of the West was very largely settled by young men who, during the earlier years of their pioneer life, owing to the actual residence requirements of the Government's land laws, were compelled to "bach it." I have known entire townships to be settled with bachelors, strong, manly, intelligent, and energetic fellows, who found in constant labor the recreation which rendered their solitary lives not only endurable, but extremely enjoyable.]

THE big full moon
Made all outdoors es light es noon.
I 'd plowed all day, 'n' put the team away,
'N' done the chores.

The soft white light
Did n' seem a bit like night.
The neighbors' shacks 'n' sheds 'n' stacks
Looked like big towns all painted white.
Ther' wa'n't no wind; I tuck 'n' pinned
A postal card
Ag'in' the section-stake,
'N' plugged the picter out at fifty yards.
Out on the hill a coyote blowed his horn.
At ten o'clock I felt so wide awake
I could n' bear to huddle up indoors,
So I pitched in 'n' worked till after one,
'N' husked a wagon-box o' corn
Jest out o' fun.

Plowin'.

I RUTHER plow 'n anything.
Jest give to me
A pair o' five-year-olds
'At 's smart,
'N' let me sling
A steel-beam plow 'at holds
Its edge, 'n' has good suck,
'N' I don't want no better luck.
It best suits me
To git 'n airly start
On eighty-acre bouts,
'N' wile the lazy louts
In town
Air groomin' theirselves down,
To crack my whip 'n' sing:
"Rockaby baby on the tree-top,
When the wind blows the cradle will rock,
When the bough breaks the cradle will fall,
'N' down will come baby, cradle, 'n' all."

Take it October days,
W'en corn is ripe;
'N' sunshine, kind o' red,
Pokes through the smoky haze;
'N' plover 'n' silver snipe
Pick up the angleworms
'At twists 'n' squirms
Erlong the furrer's bed;
'N' lazy cattle graze
Erbout the stubble lot,
Wher' little 's to be got
But frost-bit volunteer—
I trot betwixt the tails
With independent swing
'N' hope 'at never fails,
Expectin' soon to hear
The dinner-tocsin's ring;
'N' so I laugh 'n' sing:
"Heigh-diddle-diddle, the cat played the fiddle,
The cow jumped over the moon,
The little dog laughed to see such sport,
'N' the dish ran after the spoon."

Give me a good-hung plow
'At sets down flat,
'N' picks right up the dirt,
'N' turns it top-side down,
I tell ye now
I 'll bet a las' year's hat
'At you can't hurt
My feelin's no sech way.
Jest let me plow,

'N' turn the stubble down,
'N' smell the rottin' dirt,
'N' bust the gopher moun's
On eighty-acre roun's,
Ther' ain't no job in town
I 'd trade it fer;
No, sir.
Three acres ever' day
Es 'bout the reg'lar thing;
'N' 'long erbout sundown
You 'll hear me laugh 'n' sing:
"Chunks o' cold pudding 'n' pieces o' pie,
Chunks o' cold pudding 'n' pieces o' pie,
My ma said she 'd give me,
My ma said she 'd give me,
My ma said she 'd give me,
If I would n' cry."

Will.

It 's jest too bad
 The way 'at Will gits mad.
 'T was only t' other night,
 Not feelin' very well,
 I run down ther' to set a spell,
 'N' found him in the lot
 A-milkin' Spot;
 So I kep' out o' sight,
 'N' sneaked up clost,
 Jest like a ghost,
 'N' tuck the cat
 'N' dragged it back'ards down
 Spot's back.
 She h'isted onct, 'n' laid Will flat
 Across the rack,
 'N' knocked the skin
 Clean off his shin,
 'N' slopped the milk,
 So 'at the bilk
 Of the hull spill
 Soaked into Will;
 'N' he got up so sour 'n' glum,—
 Fer es fer any sense o' fun,
 He ain't got none,—
 'At I went hum.

Helpin' Hay.

BEEN up to Will's,
 A-helpin' hay.
 They 's suthin' fills
 A man,

W'en he 's a-makin' hay,
 'Ith sort o' satisfact'ry sense,
 Like goin' to a dollar show
 Fer suthin' under fifty cents.
 I allus can —
 W'en I 'm a-makin' hay
 Up ther' to Will's,
 W'en daisies blow
 'N' yaller goldenrods
 Flickers 'n' nods,
 'N' thistles show
 Across the fence
 Wher' loafin' critters feeds
 Amongst the bresh 'n' weeds —
 Feel rich enough, though I ain't wuth a cent,
 To buy the yeth 'n' run the govament.
 Ther' 's some folks kind o' grills
 W'en they 're ableeged to work,
 'N' sort o' fret 'n' fume,
 'N' hunt a show to shirk;
 But w'en I 'm helpin' hay
 Up ther' to Will's,
 W'en blue-j'ints bloom,
 'N' swishin' sprangle-top
 Are makin' crop,
 'N' peavey-buds are gittin' red 'n' redder,
 I ain't afeard of work,

But all the shim'ry day,
 Flat on a bunch of hay,
 I slouch down on the medder,
 W'ile Will fo'ks up the hay.

On Bald Bluff.

I 'VE had more fun a-rollin' stones
 'N' any other game.
 Late in the fall, w'en snakes is gone
 'N' summer moans
 Amongst the trees to kind o' blame
 The frost fer comin' on,
 'N' Bald Bluff's head
 Gits streaked 'ith red,
 Me 'n' the other boys
 Ust to tramp off up ther' to rest
 'N' keep f'om makin' noise
 On Sunday afternoons;
 'N' w'en we 'd git through huntin' coons
 'N' chasin' fawn,
 We 'd all turn in 'n' dig up stones —
 I liked that best.
 Th' way they 'd zip,
 'N' slide, 'n' slip,
 'N' bound,
 'N' bark the trees, 'n' mow the bresh,
 'N' slash the ferns, 'n' jump, 'n' cresh
 The logs, 'n' plow the ground,
 'N' shoo the squirrels 'n' scare the rabbits,
 Jest beat the world.
 Ther' ain't no countin' on stones' habits.
 We started one 'at weighed a ton —
 Went beautiful at first,
 But soon it struck
 A gnerly oak, 'n' 'gin to buck,
 Square off it whirled.
 We 's scart the worst
 You ever see,
 Fer it kep' goin' fast 'n' faster
 In a bee-line fer Jenkin's paster,
 Jest missed a tree,
 'N' tore down forty rods o' fence.
 Gosh, how the critters bawled!
 Picked out the bull 'n' went fer him
 Ch bim;
 Th' critter was n't wuth ten cents
 W'en that rock quit its sport.
 Nex' mornin' we got hauled
 Up into court.
 Cost father ninety dollars

To settle up the suit.
 I 'll recollect it allers,
 Fer we got licked to boot.

Doane Robinson.

"In Lighter Vein."

WE turn the leaves; as on a stage
 Bard, story-teller, artist, sage
 In noble sequence pass; again
 We thrill to beauty, joy, and pain.
 At length we come where runs the page
 In lighter vein.

Here she who sprang austere, full-grown,
 Full-armed from Jove's proud brain alone,
 Forgetful of her august past,
 In tricky humor prattling fast,
 Peeps laughing from her helmet—shown
 A child at last!

Here rove the gallant troubadour,
 Blind bard, and minstrel old and poor.
 Look how the twangling chords they press
 With more than whilom nimbleness
 (In gloves well-fitting, to be sure,
 And evening dress!).

Poor Colin woos his Molly dear,
 Or pleads with Norah darlint here;
 We seek the visage pale and thin
 To tell a love-lorn heart within;
 We lean to note the scalding tear,
 And lo, a grin!

Next see the sage of helot school,
 Grave, philosophic, mouthing full
 His maxims, proverbs, saws, and spells;—
 A faint, familiar tinkle tells
 (Whene'er he wags his solemn wool)
 Of cap and bells!

Across the boards from wing to wing
 They pass with pirouette, tilt, and fling;
 With whimsy, mummery, quirk, and quip;
 With light kiss blown from finger-tip;
 With airy gibe and harmless sting
 On laughing lip.

Confess, Judge Pandit, Madam Blue,
 Dear Lord Disdain (O Critic!) too,
 Your portly minds are sometimes fain
 To gravitate from that high plain,
 And smile with us an hour or two
 In lighter vein!

Mary Bates Dimond.

Observations.

THE power of unqualified assertion in literature is very great, because most readers are never in that active state of mind which examines and combats.

UNREQUITED love is seldom so persistent as romancers would have it. A stick of wood cannot long burn alone.

WE never get what we want just as we want it.

A VERY generally accepted fallacy is that which, making no distinction between the difficult and the impossible, asserts that because a man has done a hard thing, he can do anything.

DEALING with a woman, it is much wiser not to take no for an answer than to take her answer for no—which it frequently is n't.

PEOPLE who always receive you with great cordiality rarely care for you. Your true friends make you a partaker of their humors.

WHENEVER you see people in any crisis of feeling acting as you think they should naturally act, depend upon it that they are acting artificially; for nature is nearly always clumsy, and, as it were, unnatural. It is rather self-conscious indifference that does the right thing.

CONCEPTION is so narrowed by expression that the greatest masterpieces may be said to have been born giants and grown up dwarfs.

Manley H. Pike.

Wail of an Old-Timer.

EACH new invention doubles our worries an' our troubles!
 These scientific fellows are spoilin' of our land.
 With motor, wire, an' cable, now'days we 're scarcely able
 To walk or ride in peace o' mind—an' 't is n't safe to stand.

It fairly makes me crazy to see how 'tarnal lazy
 The risin' generation grows—an' science is to blame.
 With telephones for talkin' an' messengers for walkin',
 Our young men sit an' loaf an' smoke without a blush o' shame.

An' then they wa'n't contented until some one invented
 A sort o' jerky tape-line clock, to help on wasteful ways.
 An' that infernal ticker spends money fur 'em quicker
 'An any neighborhood o' men in good old bygone days.

The risin' generation is bent so on creation,
 Folks have n't time to talk, or sing, or cry, or even laugh.
 But if you take a notion to want some such emotion,
 They 've got it all on tap for you, right in the phonograph!

But now a crazy creature has introduced the feature
 Of artificial weather—I think we 're nearly through.
 For when we once go strainin' to keep it dry or rainin'
 To suit the general public—'t will bu'st the world in two.

Ella Wheeler Wilcox.
